INTERNATIONAL COUNCIL OF SCHOLARS

Mario SALMI, University of Rome, President

Marcel AUBERT, Membre de l'Institut; Director, Société Française d'Archéologie, Paris, Vice President
Ernst KÜHNEL, formerly, Director, Islamic Section, Berlin Museum, Berlin-Dahlem, Vice President
† Amedeo MAIURI, late Accademico dei Lincei, Naples
Gisela M. A. RICHTER, Honorary Curator, Metropolitan Museum of Art, New York, Vice President
Giuseppe TUCCI, University of Rome; President, Istituto Italiano per il Medio ed Estremo Oriente, Vice President

Alvar AALTO, Architect, Helsinki, Finland
Jean ALAZARD, University of Algiers
Andrew ALFÖLDI, University of Basel; Institute for Advanced Study, Princeton, N.J.
† Carlo ANTI, University of Padua
Gilbert ARCHEY, Director, Auckland Institute and Museum, Auckland, New Zealand
A. S. ARDOJO, Jakarta, Indonesia
Bernard ASHMOLE, Oxford University
Jeannine AUBOYER, Curator, Musée Guimet, Paris
Ludwig BALDASS, formerly, Director, Kunsthistorisches Museum, Vienna
Sir John D. BEAZLEY, formerly, Oxford University
† Bernard BERENSON
W. BLAWATSKY, University of Moscow
† Albert BOECKLER, late Staatsbibliothekar, Munich
Axel BOËTHIUS, formerly, University of Göteborg; Director, Swedish Institute, Rome
† Helmut T. BOSSERT, University of Istanbul
Cesare BRANDI, University of Palermo
† Henri BREUIL, late Membre de l'Institut; Collège de France, Paris
Peter H. BRIEGER, University of Toronto
Joseph BURKE, University of Melbourne
A. W. BYVANCK, University of Leiden
Guido CALOGERO, University of Rome
Alfonso CASO, Escuela Nacional de Arqueología e Historia, Mexico City
† Carlo CECCHELLI, University of Rome
Enrico CERULLI, Accademico dei Lincei, Rome
Jean CHARBONNEAUX, Curator in Chief, Musée du Louvre, Paris
† Gino CHIERICI, late Superintendent of Monuments, Pavia
Fernando CHUECA Y GOITIA, Architect, Madrid
Sir Kenneth CLARK, Chairman, Arts Council of Great Britain, London
Giuseppe COCCHIARA, University of Palermo
George CŒDÈS, Honorary Director, Ecole Française d'Extrême-Orient, Paris
Paul COLLART, Director, Swiss Institute, Rome
W. G. CONSTABLE, formerly, Boston Museum of Fine Arts
Paolo D'ANCONA, University of Milan
Sir Percival DAVID, London
Guglielmo DE ANGELIS D'OSSAT, University of Rome
Otto DEMUS, President, Bundesdenkmalamt, Vienna
Paul DESCHAMPS, Director, Musée des Monuments Français, Paris
Roland DE VAUX, Director, Ecole Française, Jerusalem
Prince DHANINIVAT, President, Siam Society, Bangkok
Adrian DIGBY, Keeper of the Department of Ethnography, British Museum, London
† Einar DYGGVE, late Director, Ny Carlsberg Foundation, Copenhagen
Gustav ECKE, Curator of Chinese Art, Honolulu Academy of Arts; University of Hawaii
Vadime ELISSÉEFF, Curator, Musée Cernuschi, Paris
A. P. ELKIN, University of Sydney
Richard ETTINGHAUSEN, Freer Gallery of Art, Washington, D.C.
Bishr FARÈS, Institut d'Egypte, Cairo
† Paul FIERENS, late Curator in Chief, Musées Royaux des Beaux-Arts de Belgique, Brussels
Giuseppe FIOCCO, University of Padua; Director, Istituto di Storia dell'Arte, Venice
Pierre FRANCASTEL, Director, Ecole des Hautes Etudes, Paris

Albert GABRIEL, Director, Institut Français d'Archéologie, Istanbul
O. C. GANGOLY, Calcutta
Antonio GARCÍA Y BELLIDO, University of Madrid
Alberto GIUGANINO, Vice President, Istituto Italiano per il Medio ed Estremo Oriente, Rome
Albert Rex GONZALES, Director, Museo de La Plata, Argentina

L. Carrington Goodrich, Universities of Buenos Aires and Montevideo; Columbia University, New York
Lloyd Goodrich, Director, Whitney Museum of American Art, New York
André Grabar, Collège de France, Paris
Basil Gray, Keeper of the Department of Oriental Antiquities, British Museum, London
Paolo Graziosi, University of Florence
† Albert Grenier, late Membre de l'Institut; Collège de France, Paris
Will Grohmann, Berlin
Walter Gropius, The Architects' Collaborative, Cambridge, Mass.
José Gudiol, University of Barcelona; Director, Instituto Amatller de Arte Hispánico
Robert H. van Gulik, The Hague
Hans Hahnloser, Bern
Charles Hentze, Trautheim, Darmstadt, Germany
† Reinhard Herbig, late Director, German Archaeological Institute, Rome
† Melville J. Herskovits, Northwestern University, Evanston, Ill.
L. H. Heydenreich, University of Munich; Director, Zentralinstitut für Kunstgeschichte, Munich
Henry-Russell Hitchcock, Smith College, Northampton, Mass.
Jean Hubert, Director, Ecole Nationale des Chartes, Paris
René Huyghe, Collège de France, Paris
José Imbelloni, University of Buenos Aires
† Guido von Kaschnitz-Weinberg, University of Frankfort on the Main
Ahmed Ali Khozad Khan, formerly, Director, Archaeological Museum of Kabul
Carl Kjersmeier, Copenhagen
† Elie Lambert, late Membre de l'Institut; University of Paris
Ernst Langlotz, University of Bonn
Raymond Lantier, Membre de l'Institut; Curator in Chief, Musée des Antiquités Nationales, Saint-Germain-en-Laye
Oliver W. Larkin, Smith College, Northampton, Mass.
Sherman E. Lee, Director, The Cleveland Museum of Art
† Paul Lemerle, late Directeur d'Etudes, Ecole des Hautes Etudes, Paris
Doro Levi, Director, Scuola Archeologica Italiana, Athens
Roberto Longhi, University of Florence
Hans Peter L'Orange, University of Oslo; Director, Norwegian Archaeological Institute, Rome
Stanislaw Lorentz, Director, National Museum, Warsaw
Otto J. Maenchen-Helfen, University of California, Berkeley
Arif Müfid Mansel, University of Istanbul
Millard Meiss, Institute for Advanced Study, Princeton, N.J.
Osvaldo F. A. Menghin, University of Buenos Aires; Director, Ethnographic Museum of the University
Alfred Merlin, Membre de l'Institut, Paris
Bruno Molajoli, Direttore Generale delle Antichità e Belle Arti, Rome
Théodore Monod, Director, Institut Français d'Afrique Noire, Dakar
Bernard S. Myers, formerly, The City College, New York
Pier Luigi Nervi, Architect, Rome
† Frans M. Olbrechts, University of Ghent; late Director, Musée Royal du Congo Belge, Tervueren, Belgium
Rodolfo Pallucchini, University of Padua
Erwin Panofsky, Institute for Advanced Study, Princeton, N.J.
Senarat Paranavitana, University of Ceylon, Paradeniya, Ceylon
Luciano Petech, University of Rome
Helmut Petri, University of Cologne
† Carlo Alberto Petrucci, late President, Accademia di San Luca, Rome
Sir Herbert Read, President, Institute of Contemporary Art, London
D. C. Röell, Director, Rijksmuseum, Amsterdam
Jorge Romero Brest, Universities of Buenos Aires and Montevideo
Andreas Rumpf, University of Cologne
Edouard Salin, Membre de l'Institut; Director, Musée Historique Lorrain, Nancy
† Alfred Salmony, Institute of Fine Arts, New York University
Meyer Schapiro, Columbia University, New York
Daniel Schlumberger, University of Strasbourg; Director, Délégation Archéologique Française en Afghanistan
Antonio Serrano, formerly, University of Córdoba, Argentina
Osvald Sirén, formerly, Curator, National Museum, Stockholm
Calambur Śivaramamurti, Director, National Museum of India, New Delhi
Werner Speiser, University of Cologne; Director, Museum für Ostasiatische Kunst
Ugo Spirito, University of Rome
Alfred Steinmann, Director, Sammlung für Völkerkunde der Universität, Zurich
Philippe Stern, Curator in Chief, Musée Guimet, Paris
† William Suida, Samuel H. Kress Foundation, New York
Charles de Tolnay, Columbia University, New York
Paolo Toschi, University of Rome
Arthur D. Trendall, Australian National University, Canberra
Naoteru Ueno, President, Bijutsu Daigaku, Tokyo
Luís E. Valcárcel, Director, Museo Nacional de Historia, Lima, Peru
† Lionello Venturi, University of Rome
Ernst Waldschmidt, University of Göttingen
Kurt Weitzmann, Princeton University, Princeton, N.J.
Sir Mortimer Wheeler, University of London
Paul S. Wingert, Columbia University, New York
Rudolf Wittkower, Columbia University, New York
Yukio Yashiro, Deputy Chairman, National Commission for Protection of Cultural Properties, Tokyo
Paola Zancani Montuoro, Accademia dei Lincei, Rome

ITALIAN EDITORIAL BOARD

Editor in Chief, Massimo PALLOTTINO, University of Rome. Section Directors: *Modern Art*, Giulio Carlo ARGAN, University of Rome; *Oriental Art*, Mario BUSSAGLI, University of Rome; *Ancient Art*, Michelangelo CAGIANO DE AZEVEDO, Università Cattolica del S. Cuore, Milan; *Medieval Art*, Géza DE' FRANCOVICH, University of Rome; *Primitive Art*, Vinigi L. GROTTANELLI, Pontificium Athenaeum Urbanianum de Propaganda Fide, Rome. Consulting Director, Sabatino MOSCATI, University of Rome. Coordinating Committee: Mario SALMI, President of the International Council of Scholars; Giuseppe TUCCI, Vice President of the International Council of Scholars; Massimo PALLOTTINO; Giulio Carlo ARGAN.

AMERICAN EDITORIAL ADVISORY COMMITTEE

W. G. CONSTABLE, formerly, Boston Museum of Fine Arts; Lloyd GOODRICH, Director, Whitney Museum of American Art; Henry-Russell HITCHCOCK, Smith College; Oliver W. LARKIN, Smith College; Bernard S. MYERS, formerly, The City College, New York; Gisela M. A. RICHTER, Honorary Curator, Metropolitan Museum of Art; Paul S. WINGERT, Columbia University.

EDITORIAL STAFF FOR THE ISTITUTO

Secretary General: Prof. Alberto Mario CIRESE. *Section Editors*: Dr. Catia CAPRINO; Dr. Ernesta CERULLI; Dr. Paolo DAFFINÀ; Dr. Fernanda DE' MAFFEI; Dr. Luciana FERRARA; Prof. Luigi SALERNO. *Consulting Editor*: Prof. Eugenio BATTISTI. *Editorial Assistants*: Dr. Margherita ABBRUZZESE; Dr. Margherita ALOSI CATELLI; Dr. Tea MARTINELLI COCO; Dr. Anna Maria ROVERI; Dr. Italo SIGNORINI.

Illustrations. Editor: Prof. Alessandro MARABOTTINI MARABOTTI. *Consultants*: Maria CALANDRA, Architect; Dr. Enzo CREA. *Assistants*: Dr. Assunta BOSCHETTI ALBANESI; Dr. Gemma CORTESE DI DOMENICO; Prof. Raniero GNOLI; Dr. Romolo STACCIOLI; Dr. Anna Maria TAMASSIA; Paola VERGARA CAFFARELLI.

Copy Editing and Index. Editor: Dr. Nicola TERRANOVA. *Assistants*: Dr. Gigliola BONUCCI CAPORALI; Dr. Maria BORSELLINO DE LORENZO; Dr. Emilia BOSCHERINI GIANCOTTI; Adriana CARINI; Dr. Marco CHIARINI; Dr. Giovanni CRAPULLI; Dr. Elsa FUBINI; Prof. Alberto GIANQUINTO; Elena GRILLO; Dr. Elena OTTOLENGHI; Dr. Giorgio STACUL; Dr. Mario TRONTI; Dr. Franco VOLTAGGIO. *Secretary*: Dr. Bianca Laura DE VITA FASANI.

STAFF FOR THE McGRAW-HILL EDITION

Managing Editor: Theresa C. BRAKELEY. *Associate Managing Editor and Translation Editor*: Ronald STROM.
Editorial Advisor: Mamie HARMON. *Assistant Translation Editor*: Richard WADLEIGH.
Office Manager: Letizia BARONE DAMIANI.
Research Editors: Edmée BUSCH; George G. MARCUS. *Assistants*: Per-Olof LUTHMAN; Susan TWIGG; Hope WEISHAAR.
Illustrations: Erika BIZZARRI; Françoise CHIARINI: Sally Lee COOK; Linda PERLMAN. *Bibliography*: Neil THOMPSON.
Copy and Proof Editors: Robert BRAINERD; Ruth EISENSTEIN; John KREMITSKE. *Assistants*: Barbara ANGELILLO; Florence DANKO; Clodagh M. FLAHERTY; Pamela JONES; Anne PHALON; Betsy REIN.
Consulting Editor: Bernard S. MYERS.
Executive Editor: George A. HOY. *Administrative Editor*: M. Barat Kerr SPARKS.

TECHNICAL STAFF

Technical Director: Dr. Matilde GIACHETTI, Casa Editrice G. C. Sansoni. *Technical Assistants*: Dr. Catervo BLASI FOGLIETTI; Giulio GIUFFRIDA RUGGERI. *Photographic Archives. Director*: Dr. Enzo CREA. *Assistant*: Dr. Paola DE GASPERI. *Maps*: Prof. Mario RICCARDI; Giuliana CAPORALI. *Drawings*: Bruno BARINCI, Architect. *Plate layout*: Piero BERTA; Paolo BUDASSI.

NOTES ON THE ENGLISH EDITION

Standards of Translation. Contributors to the Encyclopedia, drawn from the outstanding authorities of over 35 different countries, have written in many languages — Italian, Spanish, French, German, Russian, etc. To ensure faithful translation of the author's thought, all articles have been translated into English from the original language, checked for the accuracy of technical terms and accepted English forms of nomenclature by English and American art historians, and correlated with the final editorial work of the Italian edition for uniformity and coherence of the over-all presentation. Naturally the McGraw-Hill Book Company, Inc., assumes full responsibility for the accuracy and completeness of all translations. Those articles written in English appear in the words and style of the authors, within the bounds of editorial attention to consistency and stylistic and organizational unity of the work as a whole. Article titles are in most cases parallel to those in the Italian edition, though occasionally they have been simplified, as *Dravidian Art* for *Dravidiche Correnti e Tradizioni.*

New Features. Although generally the English-language edition corresponds to the Italian version, a small number of purely editorial changes have been made in the interest of clear English-language alphabetization and occasional deletions or amplifications solely in the interest of clarity. Three major differences between the two editions do exist, however:

A considerable number of cross-references have been added in many places where it was felt that relating the subject under consideration to other pertinent articles would be of value to the reader.

A more extensive article on the Art of the Americas was projected for Volume One of the English edition with an entirely new text and many plates in black and white and color. This article was designed to give the completest possible coverage within the existing space of some 100,000 words to a subject which, because of its interest to the English-speaking public, was entrusted to a group of well-known American scholars, each expert in his respective area.

Some 300 separate short biographies have been added to the English edition to provide ready access to data on the lives, works, and critical acceptance of certain artists identified with schools, movements, and broad categories of historical development that are treated in the longer monographic articles. These articles are unillustrated, but works of the artists are represented in the plates accompanying the longer articles.

Bibliographies. The bibliographies of the original Italian edition have been amplified at times to include titles of special interest to the English-speaking world and English-language editions of works originally published in other languages.

In undertaking these adaptations of the Italian text and preparing original material for the English edition, the publisher has been aided by the generous advice and, in many cases, collaboration of the members of the Editorial Advisory Committee.

CONTRIBUTORS TO VOLUME IX

Bianca Maria Alfieri, University of Rome
Rosalba Amerio, Soprintendenza ai Monumenti del Piemonte
Olga Amman, Rome
Paolo Enrico Arias, University of Pisa
Umberto Baldini, Director, Soprintendenza alle Gallerie di Firenze
Luisa Becherucci, Director, Galleria degli Uffizi, Florence
John Beckwith, Deputy Keeper, Department of Architecture and Sculpture, Victoria and Albert Museum, London

LANDSCAPE IN ART. The term "landscape" refers to that type of pictorial representation in which natural scenery is the subject or at least prevails over the action of the figures. In many civilizations landscape was a subordinate art form (e.g., in ancient Greece and during the medieval period), retaining this position even when great proficiency had been achieved in the depiction of nature (as in late Gothic and Renaissance art). In Western art from the 17th century on, landscape gained a place as an independent form of pictorial art, even though initially it was considered inferior to figure painting. Outside Europe on the other hand, especially in China, landscape art has long flourished as a respected and autonomous form of artistic expression.

SUMMARY. Introduction (col. 1). Antiquity (col. 3): *Ancient Near East; Mediterranean world.* Medieval and modern periods (col. 10): *Landscape of symbols; Landscape of fact; Landscape of fantasy; Ideal landscape; The natural vision; From Turner to the present.* The East (col. 38): *India and Southeast Asia; China; Japan.*

INTRODUCTION. The continued lack of autonomy of landscape as an art form delayed the formulation of theoretical principles of landscape art. Moreover, when these finally did appear, they were formulated in terms of theories of nature or vision. Throughout the Renaissance, for example, apart from the *Treatise on Painting* and other writings of Leonardo da Vinci, no explicit literature appeared on the subject of landscape — neither treating it theoretically nor reflecting upon its value in painting hitherto. Even Leonardo's writings are concerned with nature rather than with landscape as an independent art form. The treatises of the 17th century set forth the canons of landscape as an art form, establishing the classifications of "ideal" (ancient or heroic) and "pastoral" (rustic or picturesque) landscape; later the *veduta*, or view, a faithful reproduction of a real and specific place, was added to this classification. But such formal categories resulted only in a strengthening of academic prejudices, which, springing from classicist theories, considered landscape an inferior art form. The eventual change in opinion came about through the increasing interest in landscape on the part of artists, connoisseurs, and collectors who disregarded official esthetics in cultivating and even favoring this type of art. Their response encouraged the critical discernment of Roger de Piles, a passionate collector of Flemish and Dutch paintings. After Leonardo, his were the first truly perceptive observations on light, colors, and *valeurs* (tones); he resolutely opposed the then current prejudices against landscape as an art form. Because the art of landscape was born in conflict with the contemporary esthetic, there developed in the 18th century new and autonomous esthetic ideals. The picturesque (q.v.) and the sublime (see TRAGEDY AND THE SUBLIME) were posited by Burke (1756) and Uvedale Price (1794) as two categories of the beautiful. Moreover, notwithstanding its well-known relationship with the classical ideal, even the great French *Encyclopédie* (1751–80) defined landscape painting as one of the "richest, most agreeable, and most fruitful" art forms. In somewhat picturesque disorder the *Encyclopédie* reviewed, for the first time, the notable landscape artists of every school, even those who did not satisfy classic norms. The selection of artists evidently reflected the taste of the great collectors of that period, and the English water-colorists were singled out for high praise.

One of the first modern theories of landscape art was expounded by the English painter John Constable (q.v.). In the celebrated introduction to a book of his landscape pictures published in 1833 and in his lectures on the history of landscape (1833–36), he was among the first to propose, in opposition to the ideal of "beautiful nature," the principle that under no circumstances should nature undergo correction. He accounted for and justified diversity of style by stating that just as in nature, where "no two days are alike, not even two hours, neither were there ever two leaves alike since the creation of the world," so in art each valid work is distinct from every other. Although stated with a different ethical nuance, Constable's observation repeats Leonardo's concept of the affinity of the creative principle of the artist with that of nature. Twenty years later, the realist French critic Théophile Thoré-Burger again noted this affinity. The reiteration was not altogether fortuitous, for both the abandonment of panoramic effects and the growing disinterest in the actual site depicted were derived from a more extreme interpretation of this position. Ruskin devoted much of his writing to landscape, rejecting both stylization and the concept of composed and ideal nature. Instead he articulates the 19th-century feeling for nature in all its aspects — an appeal to the senses that may be interpreted as a flight from urban civilization or simply as the abiding, instinctive response of man to nature. As a consequence of this characteristic attitude, the importance of landscape extended far beyond the limits of the artistic genre, and sensibility to nature was refined to the extreme. In a related development, theories concerning color and its separation were propagated and became increasingly complex. These were elaborated by Goethe, Delacroix (q.v.), by impressionists (see IMPRESSIONISM) such as Seurat and Signac, and in the writings of the Macchiaioli (q.v.), but such color theories can hardly be termed scientific.

More and more, art historians have tended to investigate the relationship between landscape painting and the development of modern concepts of nature. Since the publication of Woermann's studies of ancient landscape art (1876) and with the subsequent research on landscape in German, Dutch, and French art, an ever-increasing amount of critical writing on the subject has appeared. In France, where the tradition of landscape painting is strong, many specialized studies have been published, and major exhibitions of landscape were held in 1926 and 1949. The "ideal" landscape of the 17th century has been treated in much critical writing (e.g., Gerstenberg, 1923; Waetzold, 1927), as have the "capriccio," the "vedutismo," and the numerous other specific classifications of this genre. Because of its importance, English landscape painting has been the subject of a number of general studies and exhibitions. Another topic that has been investigated, sometimes with the aid of the camera, is the influence of actual landscape on the work of certain painters. The ideal of Italian landscape as a phenomenon in the development of English taste has been the subject of a monograph by Elizabeth Manwaring (*Italian Landscape in Eighteenth Century England*, New York, 1925). The relation between landscape and astrology

in late medieval art and in the illuminations of the Limbourg brothers (q.v.) has been studied by Otto Pächt and Guy de Tervarent. According to Charles de Tolnay, magic and alchemy enter into the "afflatus of sympathetic animation" in the landscapes of Grünewald (q.v.) and certain romantic German painters of the 16th century. Flemish mysticism and ideas about alchemy in the 14th and 15th centuries have been suggested as the key to interpretation of the fantastic landscapes of Bosch (q.v.).

* *

ANTIQUITY. *Ancient Near East.* Landscape representations are found in Mesopotamian art of the earliest period; these are limited, however, to the decoration on cylinder seals, since larger art forms of that period are lacking. In the glyptics of the Uruk period (early 3d millennium B.C.; VI, PL. 33) landscape elements are depicted in a manner appropriate to the aims of the artist. In Mesopotamia a detailed representation of landscape was not an end in itself; landscape depiction was limited to more or less summary indications intended to suggest the setting of the scene. Rows of animals appear with plant elements, and hunters are seen in a mountain landscape. The mountains are represented schematically by closely spaced rows of segmental circles. This type of landscape representation continued through the first half of the 3d millennium, but it does not seem to have been used in sculpture, or at least does not appear in the few extant fragments from this period. On the other hand, a seal from Susa is remarkable in that it is decorated with a pure landscape and therefore is completely different in emphasis from the Uruk works. For this reason the piece elicits interest beyond the unquestionable excellence of its narrative treatment and style. In its depiction of a river abounding in fish and following a sinuous course among the trees, a notable feature is the schematic upside-down representation of the trees on the lower bank.

During the Akkadian period the landscape element in the representation of scenes diminished. In the stele of Naram-Sin (I, PL. 507) the mountain terrain is barely indicated by a light, undulating line, and two trees represent the vegetation. These elements are rendered very tenuously, but they may possibly indicate that landscape was present in the reliefs of the preceding period. That landscape began to appear in reliefs only at the same time it vanished from glyptics, which always paralleled but never presaged the other arts, is a highly questionable premise; in fact, a few examples of landscape elements do occur and are similar to those of the preceding period, although in the typical compositions of the Akkadian period the background is nearly always blank. Bits of landscape are found in mythological scenes, but here they are essential, since hey are intrinsic parts of the myth: a mountain from which emerges the god who had been buried there, the tree symbolizing vegetation in representations of the fertility myth. In the succeeding Neo-Sumerian period even these last vestiges of landscape vanish, and only a few stylized plants recall the more detailed motifs of the earlier period.

In Assyrian art landscape again assumed importance, initially in the glyptics of the last centuries of the 2d millennium B.C., in which animals are depicted surrounded by vegetation. With new iconographic themes, there was a return to the conception of landscape prevalent in the first half of the 3d millennium. Later, the value of landscape was enhanced in historical reliefs (see HISTORICAL SUBJECTS). Nonetheless, though here the landscape element is often central, it is not free of the iconographic conventions that persisted from the earliest period: mountains continued to be represented by rows of small squares or ovals, water by wavy lines, and so on. Perspective continued to be governed by rules that gave it a rudimentary serviceable aspect. In the oldest reliefs (those of Ashurnasirpal II) the landscape is more complete and fulfills the narrative requirements. The rivers are shown by stylized waves (in a manner that was to last throughout the Assyrian period) and the vegetation with an extensive repertory of forms. Nevertheless, it cannot be said that the rendering of landscape is the primary concern of the creator of these reliefs; he executes it with a masterful hand, but only when it is essential to his main purpose. The same concept applies to the bronze reliefs of Balawat; here, however, the expanded narrative demands a richer, more varied repertory of landscape motifs. Examples of these new devices are the city built on an island (PL. 2) and the underground course of the Tigris, which is rendered in a fashion suggesting that the side of the mountain from which it flows is opened with a series of windows (PL. 490). In the few surviving reliefs of Tiglathpileser III, on the contrary, landscape elements are almost completely absent. Landscape details — sometimes highly effective, as in the scene of a forest hunt — reappeared in the reliefs of the palace of Sargon II at Dur Sharrukin (mod. Khorsabad). The figures in the hunting scene move about in a space filled with trees similar in form but varying in dimensions; birds in flight appear in other scenes. A high point in Assyrian landscape art is marked by the Sennacherib reliefs (Br. Mus.), in which a military scene seems almost a pretext for surrounding figures with marshes, forests, and mountains. The convention of a neutral background has all but disappeared in favor of a naturalistic setting suitable to the action. In the reign of Ashurbanipal (PL. 2) there arose many new tendencies, ranging from complete absence of landscape — corresponding to the new conception of an immaterial space enveloping the figures (especially in reliefs of hunting scenes; PL. 493) — to its explicit use as a narrative element (as in the subsidiary scenes of the hunt, which show a hill crowded with spectators, and in the battle scenes at the edge of a river). Landscape also appears as an autonomous and purely descriptive element, as in a relief showing the city of Susa surrounded by trees and with a river flowing around it. It is present as well in a relief representing the flight of the Elamites below a park crossed by brooks and filled with shrines and altars. The sense of narrative is also present in the reliefs depicting the king in his garden (VIII, PL. 423); here the interlacing of vines among the trees is an elegant play of lines, the last and highest expression of landscape in Mesopotamian art.

Outside of Mesopotamia and Egypt, representation of landscape does not exist in the ancient Near East. Neither the background of the Nimrud ivory showing a lion attacking a Negro (I, PL. 510) nor the design on a plate of uncertain significance, also from Nimrud, can be classified as landscape.

Giovanni GARBINI

In Egyptian art landscape appears only as a subordinate element, in scenes representing the actions of men and beasts, never as an independent element. Nevertheless, such landscape details are frequently indispensable to the comprehension of the scene. They are indicated in monuments as early as the predynastic period, for example, in the ceremonial scene on the macehead of the Scorpion King (IV, PL. 325), where there are shrubs, trees, water, islands, and a reed enclosure. The three fundamental divisions of the Egyptian landscape — the savanna, the agricultural zone, and the marshes — afforded great expressive opportunities to artists of the 4th, 5th, and 6th dynasties, and these elements figure prominently in their reliefs and paintings of scenes from Egyptian daily life (IV, PL. 335). The theme of the seasons particularly stimulated the evocation and composition of landscapes, and those activities connected with the cycle of the seasons were favorite subjects. These scenes appeared first on royal reliefs and later on those executed for private persons. In hunting scenes the savanna is rendered as a series of undulating dunes of varied height, with sparse shrubbery and an occasional thicket. The composition is generally organized on a single plane; but in exceptional cases, such as the painting in the tomb of Sembi near Meir, the composition is distributed over various superimposed planes. In the scenes of agrarian life the environmental element is more limited and remains subordinate to the figures; in a harvest scene there is spare indication of a field where the crops are being harvested, while pastoral scenes are suggested by a few shrubs. In this type of scene, deviations from the single plane are rare and, for the most part, appear only in

works of a later period. An example is the agricultural scene in the tomb of Nakht, where an upper plane depicts a winding canal flanked by trees and encircling a small island. The landscape in the hunting scene generally comprises dense groups of papyrus plants growings at the edge of a pond, with appropriate fauna represented as a collection of types. The papyrus plants are shown in section and set in a single row, forming a kind of compact barrier of slender vertical elements.

In tomb paintings of the New Kingdom, in addition to the motifs described above, the residences of great functionaries are frequently depicted, complemented with gardens, orchards, and pools (IV, PL. 371; see LANDSCAPE ARCHITECTURE). During this period there developed a new type of landscape representation, one which evoked life in the world of the dead. Such subjects appear in vignettes illustrated in papyrus funerary texts. The Elysian fields are represented as a series of level zones, particularly in the form of small islands having canals, fields, trees, small temples, and kiosks. In such settings the dead are shown at work in the fields, either sowing or harvesting, or else they are seen in attitudes of prayer; they are sometimes depicted in boats, crossing the channels from one island to another.

An identifiable landscape element of the New Kingdom is the Theban necropolis depicted in murals, sarcophagi, and wooden steles. The mountain on the west bank is rendered as a high hill with descending wavy lines of a reddish color, dotted with yellow to represent sand. Halfway down the mountain are shown the entrances to the hypogea, with their steles and a few fruit trees dedicated to the dead.

Sergio BOSTICCO

Mediterranean world. In modern times a romantic, and even sentimental, approach to nature has become so ingrained that it is difficult to understand the wholly different attitude of the ancient world. The easiest way to achieve such an understanding is to find out how the ancient approach to the natural world has been transformed.

In the early Bronze Age in Greece religion assumed a markedly ecstatic character that was manifested in many ways, particularly in the dynamic pottery forms, which were often animalistic in character and decorated with spirals and cordons. There were signs of the vital, rhythmic sense of nature that was to find its fullest expression in the Dionysiac thiasos. During the middle Bronze Age in Crete this awareness brought about the creation of the primeval and fundamental forms of nature which have persisted to the present: the palmette and a series of waves sprouting from the spiral, symbolizing the genesis or earliest form of life (the *Urpflanze* of Goethe). In the late Bronze Age in Crete, images of land and marine flora and fauna derived from this basic motive rhythm began to prevail. The marine forms were clearly the attributes of the great sea-born goddess of life, later identified with Aphrodite. A peculiarity of Cretan landscape art is the placement of natural features and flora not only below the animal figures but above them as well — a convention signifying that life is immersed in nature and is one with it (VIII, PL. 423). The gods are forces of nature and appear to man only as visions; the men to whom they manifest themselves must therefore cover their eyes. Such attitudes of *aposkopeia* appear in later Greek art, in the depiction of satyrs and other nature demons dazzled by the appearance of their godly masters. Sometimes Egyptian elements appear in the landscape, for even at that time Egypt was regarded essentially as a divine land. Lions, sphinxes, and sirens in a landscape are an indication of its daemonic character.

By the Mycenaean phase of Cretan civilization, landscape was already represented in a more rigid and schematic manner. On Geometric pottery plant motifs were replaced by concentric circles, rings, crosshatching, and meander patterns. In no other period has the primordial rhythm of life been expressed with such severity. At the same time, a more varied repertory of ornament developed, including rows of deer, birds, horses, and decorative fillers. Nor were indications of landscape lacking, particularly in the Cretan Geometric. In the late Geometric period the palmetto reappeared, and in Greek ornamental art thereafter the human feeling of unity with a natural environment as a manifestation of divine power was expressed in an ever-increasing variety of ways: zoomorphic friezes, decorative fillers, and the classic, organic acanthus ornament.

In the archaic period, however, these images of nature became accessory elements rather than the primary expressions of religious sentiment they had been in Cretan landscapes. The deities, no longer abstract forces of nature, manifested themselves not as visions but as real beings. In place of wild animals, birds, and flowers, there appeared satyrs and maenads; octopuses and shells were replaced by Nereids and Tritons. Temples and other edifices that are dwellings of the gods served to emphasize the three-dimensional character of the landscape. The world was thus observed in its concrete aspects, and the background peculiar to each event was revealed. In the "Chigi oinochoe" (XI, PL. 70), the hunters are depicted hiding behind a bush, and Achilles attacks Troilus near a spring and a sacred grove. The landscape is represented by means of very spare indications, but these suffice to set the scene for the event. The same approach is particularly evident in Ionian art, as well as in the Etruscan art derived from it. The interior of a Samian cup is completely covered with two trees containing birds' nests; between them is a running man. The intimate contact with nature here acquires a more personal character, reminiscent of the archaic poetry of Sappho and Alcman.

This newly developed ability to depict individual landscape backgrounds was further used to convey a lighthearted enjoyment of life amid nature in the hunting and fishing scenes of the Etruscan grave painting (PL. 2). The natural setting also assumed strong expressive values in the works of the Attic ceramist Exekias (q.v.) and his school. In an amphora depicting Eos mourning the death of Memnon (Mus. Vat.), the figures are set within a sinister environment that includes a stark forest, a solitary bird, and a still life of weapons.

In the art of the classical period, landscape not only provides atmospheric background but also contributes more directly to the fate of the beings dominating the image. Already in the transition from the late archaic to the classical period, the Berlin cup of the Brygos Painter shows Night plunging into the ocean, while at the first light of day the lightning of Zeus annihilates the giants. In the Ilioupersis hydria (Naples, Mus. Naz.) of the Kleophrades Painter (Epiktetos the Second), the palm separating the temple where Ajax violates Cassandra and Neoptolemos slays Priam droops meaningfully. According to Pausanias, the painter Polygnotos (q.v.) used spare and allusive landscape elements in his mural paintings at Delphi. In the east pediment of the Parthenon, sunrise and nightfall frame the cosmic event of the birth of Athena, embodiment of the intellect, while the nature gods Dionysos and Aphrodite are shown reposing on a rocky mound. In a white-ground cup, landscape lends a lyric atmosphere to a scene in which one of the Hesperides plucks an apple from a tree with a bowed trunk as graceful and slender as the maiden herself. Another dramatic background is the high mountain looming over the seashore where Pelops carries off Hippodameia after a breathless chase. The fluttering garb and the waves breaking on the shore suggest the sea breeze, and the doves perched nearby on a sapling echo the sentiments of the lovers.

It is but a short step then to the extended landscape backgrounds of the friezes carved by Greek artists at Xanthos, Gjölbaschi, Tlos, and elsewhere for the Lycian kings. Here the Near Eastern tradition of the historical tableau is fused with the classical aim of fixing the event within a well-organized setting. The panels of the Lycian reliefs are reminiscent of the illustrated books, with or without text, that were probably widely disseminated throughout the ancient world; in these the scenes were arranged in coherent sequence, so that even a person unable to read could follow the narrative. The Homeric goblets, the Tabulae Iliacae (Rome, Mus. Cap.), and the Joshua Roll (II, PL. 447) are derived from these books, as are certain Roman wall friezes (especially in Pompeian Style II) and the column friezes of Trajan (VII, PL. 263) and Marcus Aurelius. The Column of Trajan is classical in character not only in its figures but also for its land-

scape backgrounds. Recalling the compositional style reputed to have been that of the painter Polygnotos, these contrast sharply with the spatial-illusionistic pictorial manner of older Roman art. The historical realism of the triumphal reliefs became stylized in an ideal programmatic idiom through the incorporation of such classic elements. The Trojan frieze in the House of the Cryptoporticus in Pompeii is a more faithful reproduction of a Greek model of the late 4th century B.C. As far as it is possible to determine, the landscape backgrounds in all these works did not have the expressive force of the tightly composed symbols of the high classical period described above, or even of the bare tree in the mosaic *The Battle of Alexander* (VII, PL. 154). This tree stands out in an uncanny manner near the victorious king, as like a bolt of lightning he shatters the venerable Persian empire.

Landscape was of greater importance in theatrical scenery. The Prometheus of Aeschylus was chained to a rock; and according to Vitruvius (Introduction, vii, 11), Agatharchos painted for Aeschylus a set that furnished incentive for Vitruvius himself — and for Democritus and Anaxagoras — in his theoretical research on optical perspective. Greek perspective, however, is completely different from the central perspective of Renaissance art, which places the single elements in a fixed position within a wide space, leading in well-ordered fashion to a church or other imposing building. Greek perspective is a single-unit, corporeal perspective. The Greeks reiterated again and again that the mission of art was to depict things as they are, not as it appears they should be. Therefore separate images were treated perspectively, but the organization of a whole picture was never based on a unified central perspective. The Greeks naturally studied perspective in theory and regarded it as a means of realizing the organic unity of a body; but they worshiped and depicted the divine corporeally, as a single entity, not as part of a spatial construct. In the classic compositional unity, Apollodoros appears to have attained a level far above that of Agatharchos. The ultimate goal of the Greek landscape artists is best exemplified in the paintings of sacred places and rocky landscapes inserted among the architectural elements in the cubiculum and its alcove in the villa at Boscoreale (VIII, PL. 424). As in the theater sets of late Hellenistic type mentioned by Vitruvius (vii, 5, 2), all the resources of perspective are used with complete mastery but in such a way as to promote autonomy for the single elements by giving them individual viewing points. The sacred groves on the lateral walls are represented in a freer Roman manner, giving a feeling of space and atmosphere; whereas the scenery in the alcove, copied more faithfully from Greek prototypes, has a peculiarly dry and isolated quality. How far back this Greek ability in perspective design goes is affirmed by the architectural elements in late classical vase painting.

In Hellenistic art, landscape — like all Roman art — became a free synthesis of Greek elements, greatly elaborated. Actual copies from the Greek are rare and therefore take on more importance, since the degree of faithfulness can then be measured against the few surviving originals. The "yellow frieze" of the House of Livia on the Palatine, like certain other works of the type, is stylistically so different from the prevailing Roman art of its period that it can be explained only as a copy from some illustrated book of the early Hellenistic period. The frieze depicts the kingdom of Ptolemy in the form of an idealized landscape with shrines of Isis-Tyche, and Isis-Neith, in the guise of Athena, and of Dionysos, Priapus, and Poseidon. Scattered among them are worshipers, shepherds, and pilgrims. The somewhat angular, insubstantial, yet graceful appearance of the human figures is similar to that found in works dating from about 300 B.C., but the rhythmic arrangement of the deities rather suggests work of the late classical period. The landscape background consists of forms rendered three-dimensionally, but there are no images filling the intervening spaces. Where the attention of the viewer is directed to the background of the scene, as in the Munich offering relief (late 3d cent. B.C.), by contrast the three-dimensional forms are more closely grouped in the foreground. The two deities in this relief are unidentified and mysterious; however, Hellenistic variants from Rhodes indicate that they represent Isis and Serapis.

The mission of Isis, a theme known through inscriptions, presented the Egyptian element in a Greek manner in order to be more understandable to the public. Because of this intent, on the Munich relief Isis and Serapis are barely indicated, and on the yellow frieze of Livia, Isis-Neith is assimilated into Athena; also, Isis is often hidden behind Hecate, Artemis, or Aphrodite. The great number of landscapes of Egyptian type in Roman art (PL. 3; VII, PL. 197) unquestionably proceed from the image of Egypt, as a land sacred to the gods, conveyed by books illustrating the mission of Isis. Such illustrations readily served as models for the new type of mural decoration of Roman private houses. Settings were rendered in depth in many examples of early Hellenistic art, but this spatial treatment disappeared in the 2d century B.C. The most important example, the Telephos frieze of the great Pergamon altar (VII, PL. 174), undoubtedly inspired by an illustrated book, has a landscape background that differs very little from those of the late classical period.

Knowledge of landscape representations used as settings for the deeds of great men in the art of the Roman republican era derives only from literary sources. The surviving funerary images suggest that the figural components were dominant.

The advances in illusionistic perspective of Pompeian Style II (beginning ca. 80 B.C.) offered far greater possibilities for landscape in mural decoration. Artists not only copied Hellenistic landscapes, as in the yellow frieze in the House of Livia and — even more notably — the atrium scene in the Villa of the Mysteries in Pompeii, but they controlled and enhanced the sense of space to such as degree as to convey even the monumental scale of Roman vaulting. The most accomplished examples of this illusionistic style are the sacred groves painted at the center of the long sides of the cubiculum at Boscoreale and the Vatican Odyssey landscapes (VII, PL. 180). The latter cycle, like all the similar Roman painted friezes, was derived from an illustrated book in which the figural style supports a date of about 320 B.C. The landscape type was probably similar to the frieze in the House of the Cryptoporticus in Pompeii. In the Roman Odyssey frieze the landscape acquires an independent value in relation to the figures; it is rendered more spacious by means of perspective techniques that make the figures appear to be deployed in the distance. The "continuous narration," that is, the sequence of different scenes in the same landscape, thus achieved the significance Wickhoff has recognized as characteristically Roman. The landscape surrounding the human figures suggests a supernatural realm. In the central panel with Odysseus and Circe is a palace, with an exedra and a baetulus indicating a sanctuary of Isis. The great goddess guides the wanderings of Odysseus, whose descendants, together with those of Circe, were later to found the cities of Praeneste and Tusculum. The spatial depth of the composition is used effectively to mark out the progress of the action; as in the *Aeneid*, the hero is presented in a sequence of cosmic events.

In mythological landscapes, of which the oldest known is the Io painting in the House of Livia, book illustrations are reproduced on a larger scale. They reveal themselves clearly as copies after classical originals, since it became customary to give wall decorations the aspect of a collection of paintings. But the small scale of the figures and the sequential narration in many of these landscapes clearly reveal the fact that the original models were in the small format of picture books. Often the grandeur of nature imparts an awesome or violent tone to the scene; at other times the natural elements reflect the good fortune vouchsafed to the favorite of the gods. The stringent organization of all the paintings within the decorative scheme suggests that the hero acts in accordance with a higher natural order. The art of the early and middle imperial era reveals an almost irrational submission to divine will, which, together with the motifs of the sacred mysteries found in the surviving decoration, heightens the supernatural aspect of this order.

Roman landscape art was not limited to single paintings and frieze panels, for the decoration throughout the house was related to its landscape setting. The wainscots of the walls were adorned with plant patterns, thus relating them to the

garden and the image of the sacred grove. The upper sections and the spaces between the principal panels were treated as apertures disclosing sacred groves; sometimes such areas of landscape became the principal decorative element, as in the Villa of Livia at Prima Porta (VII, PL. 208). Subjects favored for the large landscapes decorating the walls adjoining the garden of the house include zoological gardens modeled after the gardens of Hellenistic nobles, Orpheus as the lord of nature, painted statues, water nymphs, and other motifs related to the sacred groves. All these elements were framed within grandiose landscape layouts for villas and sanctuaries derived from Hellenistic structures. The circular and rectangular temples at Tivoli, built on the edge of a gorge, represent one such idealized Alexandrian landscape.

An original contribution of Roman art is the decorative landscape relief in which are fused pictorial motifs and elements of Greek landscape votive reliefs, used as in the paintings described above. The Dolon relief (Vienna, Kunsthist. Mus.; Rome, Mus. Naz. Rom.) corresponds to early Pompeian Style II painting, the Icarus relief to late Style II, and the Polyphemus relief (Rome, Villa Albani) to the Neronian Style IV. Landscape motifs appear on silver vessels (VII, PL. 216), cameos, and cameo-carved crystals. Particularly fine examples are the silver cup of Egyed (Hungary), depicting a landscape of Egyptian type, and the scrollwork on the silver cups from the Hildesheim Treasure (Städt. Mus.), reminiscent of the Ara Pacis. Propitiatory landscape symbols, executed in more modest forms, are found on clay pottery and terra-cotta lamps. Such images survived until the Christian Era, when they assumed definite symbolic significance. This intent is confirmed by the fact that images of shepherds and flocks, sacred enclosures, *paradeisoi*, and votive landscape paintings were already regarded as propitiatory images in the earliest years of the Empire, though not yet linked to any explicit dogma.

The most important sources for the study of landscape motifs of the middle imperial period are the Column of Trajan and that of Marcus Aurelius. Since they are classical in style, their landscape component has less importance than it had in the art of the early Empire. Nevertheless landscape is significantly present in the initial scenes on the Column of Trajan — the river, with the solitary sentries on the banks, and the sinister-looking forests from which the barbarians emerge. On the Column of Marcus Aurelius, the effect of supernatural elements is heightened through a faint, almost expressionistic treatment of rivers, encampments, and especially the figure of the rain god. The finest example of landscape in the painting of the same period is found in the paradisiac aquatic scenes in the building lying below the Church of SS. Giovanni e Paolo in Rome. Landcapes of this type were to assume more and more the symbolic purpose of a promise of heavenly felicity. In funerary art this intention was anticipated in the early Empire, as shown by paintings from the columbarium of Villa Doria-Pamphili (VI, PL. 60), the tombs on the Via Latina (Rome), and the Caivano tomb (north of Naples). Beginning in the 3d century these motifs were used in catacomb paintings, and the Hellenistic protective image of the shepherd became common in the decoration of sarcophagi.

Notable landscapes are preserved in mosaic pavements, particularly in Antioch and North Africa (I, PLS. 23, 24, 26). The most elaborate mosaic landscapes are those in the Great Palace of the Emperors in Istanbul, works that can be dated no earlier than the 5th century. In Christian art the same motifs were adopted in mosaics on the walls and ceilings of churches. Examples worthy of note include the mosaic of S. Costanza and the nave mosaics in S. Maria Maggiore (mid-5th cent.) in Rome, the Good Shepherd in the so-called "Mausoleum of Galla Placidia" in Ravenna (X, PL. 179), and the mosaics in the Great Mosque in Damascus (X, PLS. 379, 380, 386). The last-named mosaics, executed for the caliphs, are in a sumptuous and aniconic Byzantine style: no living being appears in them, and the buildings and gardens on the banks of the river are a splendid array. Their decided three-dimensional treatment, derived from the Greek tradition apparent in the yellow frieze of Livia, is in strong contrast to the expressionistic style of the S. Maria Maggiore mosaics. Their style is reminiscent not only of illustrated manuscripts of Homer and Virgil but also of the Roman triumphal columns. The landscape of the Good Shepherd in the "Mausoleum of Galla Placidia" and of the Vienna Genesis (PL. 6) is purely Greek in style. These general stylistic differences were to persist throughout the course of medieval art.

While the works of the classic artists, for the most part, evidence profound awareness of nature, only those of the Romans presented nature to man in the guise of a paradisiac ideal of fulfillment. This sentimental approach, joined with an effort toward a deeper comprehension that is closer to the Greek concept of nature, mark the modern attitude toward landscape and the place of nature in art.

Karl SCHEFOLD

MEDIEVAL AND MODERN PERIODS. *Landscape of symbols.* In the art of the early Middle Ages the existence of natural forms was at first acknowledged by symbols that bore little relation to actual appearance. Why did these symbols satisfy the medieval mind? To some extent they were the outcome of medieval Christian philosophy. If our earthly life is no more than a brief and squalid interlude, then the surroundings in which it is lived need not absorb our attention. If ideas are Godlike and sensations debased, then our rendering of appearances must be as far as possible symbolic, and nature, which we perceive through our senses, becomes categorically sinful.

Parallel with this mistrust of nature was the symbolizing faculty of the medieval mind: the power of immediately substituting an idea for an object, or an object for an idea, which allowed men to accept without question even unconvincing equivalences. Although this attitude toward nature could never produce landscape painting in the modern sense, it did, in two ways, prepare the way for the kind of art that may be called the "landscape of symbols."

The less an artifact interests the eye as imitation, the more it must delight the eye as pattern, and an art of symbols always evolves a language of decoration. More important still, when men begin to look with pleasure at the actual details of nature, the symbolizing habit of mind gives to their observation an unusual intensity, for they look at flowers and trees not only as delightful objects but as prototypes of the divine. It is this attitude, no doubt, that gives to the earliest naturalism of the Middle Ages its beauty. The leaves, flowers, and tendrils of Reims and Southwell Minster have the clarity of newly created things.

Natural objects were first perceived individually, as pleasing in themselves and symbolic of divine qualities. The next step in the direction of landscape painting was to see them as forming some tangible whole that would be a symbol of perfection within the compass of the imagination. This end was satisfied by the discovery of the garden. In a sense "discovery" is the wrong word, for the enchanted garden — be it Eden, the Hesperides, or TirnanOg — has been one of humanity's most constant, widespread, and consoling myths; and its reappearance in the 12th century was only a part of the general reawakening of the imaginative faculty.

One of the first garden scenes with figures in painting is a 14th-century fresco in the Camposanto in Pisa, once renowned as the work of Orcagna but actually a fresco by an unknown follower of the Lorenzettis. It represents a number of solid-looking revelers making music under the trees, a carpet of flowers at their feet. This work is an offshoot of Sienese art, for landscape had no tradition in Florentine painting. The stark, economical rocks that serve as background in the paintings of Giotto admirably complement the sculptural balance of each group; but Giotto, who was so great an observer of human gesture and expression, disdained to record his observations of plants and trees.

Thus, it is to Sienese painting that one must look for the sense of natural beauty which occurs in the poetry of the early 14th century; and the pictorial counterpart is found in the work of Simone Martini and the Lorenzettis (PL. 9). The first surviving landscapes, in the modern sense, are in Ambrogio Lorenzetti's frescoes of Good and Bad Government in the Palazzo

Pubblico in Siena (PLS. 194, 195; VI, PL. 378). These are so factual that they hardly belong to the landscape of symbol, and they remained unique for almost a century. Simone, on the other hand, was the born interpreter of heavenly beauty in sensuous terms. In this gift he was at one with the finest Gothic art of France, and it was no accident that, in 1339, he found his way to Avignon.

It was presumably in Avignon that Simone met the man whose name has come to stand for the juncture of the medieval and modern worlds, Petrarch. Petrarch figures in all history books as the first modern man; and rightly, for in his curiosity, his skepticism, his restlessness, his ambition, and his self-consciousness, he is certainly akin to the modern temper. He was probably the first man to express the sentiment on which the existence of landscape painting so largely depends — the desire to escape from the turmoil of cities into the peace of the countryside. Then, too, Petrarch was an incipient botanist, not merely delighting in the decorative profusion of flowers, but minutely studying their characteristics and keeping a daybook to record their progress. Finally, he was the first to climb a mountain for its own sake, to enjoy the view from the top and relate the experience. These modern traits continue nonetheless to be dominated by a monastic philosophy, and so it is with Petrarch's responsiveness to nature: for him, and for the landscape painters of the late Middle Ages, nature as a whole was disturbing, vast, and fearful, laying open the mind to many dangerous thoughts.

Even in such wild country man may enclose a garden, however; it is, appropriately enough, at Avignon that the first pictorial expression of this new gratification is to be found, in the landscape frescoes that decorate the wardrobe room of the Papal Palace (VI, PL, 325). They were begun in 1343, and there are indications that they represent a well-established style, of which no other trace remains. The Avignon frescoes are the first complete examples of the landscape of symbols, both in subject and in style. They present an untroubled enjoyment of open-air life — people fishing in a garden pool, hawking, and ferreting — and still preserve from the more constrained, symbolic vision of the Middle Ages the full mastery of decoration. Interest in naturalistic detail has not yet overpowered the feeling for texture that was the legacy of Byzantine art. This taste for decorative richness in landscape, first significantly evident in these tapestrylike frescoes of Avignon, is apparent throughout the 15th century in the tapestries themselves, which have survived in great numbers.

In religious art, the beautiful subject of the *hortus conclusus*, the enclosed garden where the Madonna can sit on the ground and the Christ child play with the birds, achieved great popularity during the 15th century. At first the garden is very small, only a conventional symbol of enclosure, as in the charming paintings of Stefan Lochner. But sometimes there are large enclosures: a flowery orchard is seen in the Stefano da Zevio *Madonna in the Rose Garden* (VI, PL. 372) — and here the source of inspiration was undoubtedly a Persian miniature. Of all paradise gardens, the jewel and crown — it is indeed like the enameled crown of a Gothic goldsmith — is the little school of Cologne picture in Frankfurt (VI, PL. 345). It contains the elements of late medieval landscape in their most perfect form and distills a world of delicate perception where flowers exist to please the senses of sight and smell, fruit to satisfy the taste, and the sound of a zither, mingled with that of falling water, to delight the hearing. Still, all these sensations have some immaterial value, for they are conceived as testimonies of heavenly joy, and the picture is full of Christian symbols: the fountain, the birds on the battlements, the Holy Child making music, and the tiny dragon of evil lying with his belly in the air.

Outside the garden wall were mountain and forest, and for each the Middle Ages had contrived a symbol. The mountains of Gothic landscapes, those strange, twisted rocks that rise so abruptly from the plain, are part of a very ancient pictorial tradition that goes back to Hellenistic painting. Surviving in manuscripts based on antique models, they were common in Byzantine art and became the central motif of icons representing the desert of Sinai. But they do not survive solely as symbols of desert places; they were a convenient symbol for any mountain. Why did it remain the practice to use a sort of ideogram for mountains when other natural objects were treated realistically? One answer might be that mountains were large and inapprehensible. Perhaps another reason for the unreal mountains of Gothic landscape was that medieval man did not explore them: he was not interested. The forests outside the garden wall, on the other hand, were different in appeal. Dark woods had always stirred the medieval imagination, and in the 14th century man penetrated their depths in partaking of activities such as hunting.

The Avignon frescoes portray hunting, fishing, and falconry; and the earliest pictures concerned entirely with observation of nature are in manuscripts on sport. Hunting is traditionally the occupation, often the sole occupation, of the aristocracy, and the painting style that made hunting one of its chief subjects was an aristocratic one. It grew up in the courts of France and Burgundy about 1400, and its most perfect expression survives in the manuscripts illuminated for the great bibliophile the Duc de Berry. One of these, the *Très Riches Heures*, to which the Limbourg brothers made their contribution from about 1409 to 1415, is crucial in the history of landscape painting, for it stands halfway between symbol and fact (PLS. 8, 137–140; VI, PL. 65). Pol de Limbourg and all the other artists who created this style, though they were employed by princes, came from the predominantly bourgeois Low Countries, from a land of work and fact. The calendar of the *Très Riches Heures*, with the occupations of the months, provides a comprehensive illustration of everyday life in the Middle Ages; and although several scenes are devoted to the pleasures of the chase, more than half represent the work of the fields. In these depictions one is aware of an eye for fact so keen that the symbolic inheritance of the Middle Ages is almost forgotten.

Aristocratic landscape painting originated in the courts of France and Burgundy but quickly spread to Italy, where Gentile da Fabriano gave the International Gothic style a fullness, and Pisanello a finality, beyond the range of the illustrators for the Duc de Berry. Pisanello's drawings evidence his almost Leonardesque curiosity about nature, and one of his few surviving pictures, *St. Eustache* (London, Nat. Gall.), shows his feeling for forest life. It is so dark in this wood that only after a few minutes can one discern all the animals. This murky atmosphere was part of the imaginative perception of the time, as is evident from several other *sous-bois* of the 15th century, above all the superb hunt scene by Paolo Uccello (XI, PL. 44). It is known that Pisanello painted many wall decorations, in the Palazzo Ducale of Mantua and elsewhere, with small figures in landscapes; of these works, which must have developed the style of the Limbourg calendar, nothing remains except some preparatory drawings.

The most elaborate and extensive landscape of symbols, however, comes not from the manuscript but from the tapestry tradition. This is *The Procession of the Magi* by Benozzo Gozzoli (VIII, PL. 193), where all the details of late Gothic landscape — the carpets of flowers, the little woods, the fantastic rocks, the formalized trees, and the cypresses already stylized by nature — are combined to decorate and delight. But by 1459, when this fresco was painted, the landscape of symbols had become somewhat self-conscious and had already ceased to reflect the true creative impulse of the time.

What was it that made men no longer content to put together the precious fragments of nature into some decorative whole? It was a new idea of space and a new perception of light. In the landscape of symbols the nexus of unity was the flat surface of the wall, panel, or tapestry. About 1420 some change in the working of the human mind demanded a new nexus of unity, the enclosed space. In a very extended sense of the term, this new way of thinking about the world may be called scientific, for it involved relation and comparison as well as the measurement on which science is based. But this new awareness antedates the real rise of science by almost 200 years, and it is found in the work of artists who seem untroubled

by the mathematics of perspective, notably Fra Angelico and the manuscript illuminators of the north. This spatial sense is combined with another unifying medium, light. It has often been said that the sun first shines in the landscape of *The Flight into Egypt* that Gentile da Fabriano painted in the predella to his *Adoration of the Magi* of 1423 (VI, PLS. 84, 85). To a great extent his style is still symbolic, for the rising sun itself is a solid disk of gold, and the light it sheds on the hillside is rendered by allowing the gold ground to show through the paint. But Gentile, with a sure sense of values, fused this golden light with the rest of his landscape, with the shadows cast by the olive trees and with the cool tone of the valley. Here for the first time the details of landscape are united by light, not solely by decorative arrangement. A similar beauty of morning or evening light pervades the landscape backgrounds of Fra Angelico.

Despite these moments of enchantment, it was not in Italian art that light became the *primum mobile* of painting. As early as 1410 Pol de Limbourg, in his eagerness to record with truth the country life, had achieved a new unity of tone; and in 1425 Hubert van Eyck, in the *Adoration of the Holy Lamb*, painted the first great modern landscape (PL. 11; for opinions on the dating and attribution of this work, see V, cols. 325–326).

Landscape of fact. The first modern landscapes were painted between 1414 and 1417, probably by Hubert van Eyck, in a manuscript known as the *Heures de Turin* (Turin, Mus. Civ.) executed for the Count of Holland (see also V, cols. 327–328). In these miniature landscapes Van Eyck achieved by masterful color a sense of the saturation of light. The landscape has a subtle tone hardly observed again until the 19th century, and the reflection of the evening sky in the water is exactly the kind of effect that was to become part of the popular landscape imagery after the mid-19th century. Historically, they are among the most original and astonishing works of art in the world, without clear precursors. If they are indeed by Hubert van Eyck, and if one accepts the inscription on the Ghent Altarpiece saying that it was largely his work, then it must be that he was responsible for the remarkable distance effects in the *Adoration of the Holy Lamb*, where the landscape melts into light as in a work of Claude Lorrain. In the pictures painted after Hubert's death in 1426, which are certainly by Jan van Eyck, the landscapes are more factual, more urban, and less imaginative.

The other tradition of painting in the Low Countries, that which springs from Tournai and from the artist whom historians call either Robert Campin or the Master of Flémalle, was also concerned with the facts of landscape but was closer to the tradition of the Limbourg brothers. Campin's backgrounds, as sharp and crystalline as the view through the wrong end of a telescope, show little of the Van Eycks' rapture at the all-enriching envelopment of light. Painters of this group seem to have preferred landscapes of winter — a season in which the forms of nature have the angularity and the linear clarity characteristic of this sober late Gothic style.

The resolute search for truth in these early Flemish landscapes, the eagerness with which the artist's eye fed on each object, raises the question of how they were done. They could hardly have been painted from memory. But were they put together from preliminary drawings, or are they portraits of actual places? Hubert's miniatures display so sure a sense of color values that they must be based on studies made directly from nature, probably in water colors. Jan's townscapes were probably based on silverpoint drawings made on the spot. The first indisputable piece of topography in art, however, is by a follower of Campin, the Swiss Konrad Witz. This is his background for *The Miraculous Draught of Fishes* (1444; Geneva, Mus. d'Art et d'Histoire), which portrays the shores of the Lake of Geneva — a work that remained unique for 50 years.

The interest in the precise character of a particular spot, which was part of the general curiosity of the 15th century, culminated in the topographical water colors of Dürer. The earliest date from 1494, and the drawing of Innsbruck (Vienna, Albertina) is the first portrait of a town. It evidences a delicate perception of light, but most of Dürer's water-color landscapes are remarkable less for esthetic qualities than for dexterity and curiosity that, by its intense concentration, has an almost hypnotic effect.

One condition of the landscape of fact was a new sense of space. This appears simultaneously in Flemish and Italian art, and though it produces a similar result, it is different in means and intention. In Van Eyck it is instinctive, a by-product of the perception of light; and throughout the course of Flemish painting it remains empirical. This empirical rendering of space, this tracing as it were on a transparent screen, fulfills the requisites of naturalistic painting. But it could not satisfy the mathematical-minded Florentines, who demanded, in the words of Luca Pacioli, that art be concerned with "certainties," not with "opinions"; and they believed that such certainties could be established only by mathematics. They defined the real as that which could be proved to occupy a given position in space. The result of this thirst for certainty was scientific perspective, invented, it is said, by Brunelleschi, first put into words by Leon Battista Alberti, and given its fullest exposition by Piero della Francesca.

Scientific perspective is clearly not a basis for naturalism, and its abstract character was not fully understood even in 15th-century Florence. Alberti himself fluctuates between a mathematical and a realistic approach to appearances, without recognizing that the two are incompatible. He had come to take pleasure in the spectacle of nature and, in order to concentrate the visual appearances that delighted him, had invented a device that was a sort of camera obscura. Alberti has described the vast and varied panoramas obtained in his magic box, and it is evident that his conception of landscape is related to the first realistic backgrounds of Italian art, which appear about 1460 in the work of Baldovinetti and the brothers Pollaiuolo. The notion of a distant view from a high terrace must owe something to Flemish influence, but the literal manner in which these artists depict their native Valdarno suggests that their real motive was scientific naturalism. The landscape in Pollaiuolo's *Martyrdom of St. Sebastian* (1475; XI, PL. 182) is of astonishing sweep and truth. Of very high order as topography, it discloses a curiosity and sharpness of vision strong enough to make the landscape in the picture as important as the nude. But masterful as this background is, Pollaiuolo has not overcome the difficulty of a smooth transition into space, which was solved instinctively by Van Eyck: there is still the jump from foreground to background, an uneasy middle distance. It is this shortcoming which mars the first Italian picture in which landscape is not incidental but essential, Pollaiuolo's *Rape of Deianira* (XI, PL. 181).

These paintings show how difficult it was for the Florentines to combine a mathematical with a realistic position. The panorama of the camera obscura demanded a high point of view, but Brunelleschian perspective was feasible only when the receding plane was at right angles to the plane of vision. In the two most beautiful distance views of the 1460s this fact is recognized, and the traditional device of a high ledge is adopted; the works in question are the reverse panels of Piero della Francesca's portraits of the Duke of Urbino and his wife (PL. 11). Piero, the greatest living master of perspective, was also a friend of Alberti and must have known his camera obscura. But when it came to the painting of light, he realized the superiority of the north and, of all his contemporaries, made the most intelligent use of the late-14th-century fashion for Flemish painting.

The naturalism of Alberti's magic box and the Pollaiuolo panoramas was a freak, an experiment without roots, as was so much of 15th-century art and thought. It was not in Tuscany but in Venice, in the art of Giovanni Bellini, that the revelation of the Van Eycks was thoroughly understood and expanded upon. Bellini was by nature one of the great landscape painters of all time. How far he was directly influenced by Flemish art is impossible to say. In portraiture, he certainly studied the Van Eycks and Memling; and he was probably affected by

the mysterious and powerful personality of Antonello da Messina, who was in Venice in 1475 and who, through Petrus Christus, was the direct heir of the Van Eyck tradition. Antonello's landscapes have all the dispassionate precision of his Flemish masters; moreover, he was a master not only of Flemish realism but also of systematic perspective.

Bellini's responsiveness to nature required no great stimulus from outside, however, for he was born with the landscape painter's greatest gift: an emotional response to light. In his early work he had loved the poignant light of sunrise and sunset, and he continued to portray such moments of heightened emotion when they could intensify the meaning of his subject, as in the *Resurrection* in Berlin (Staat. Mus.). As he grew older, he became more in love with the full light of day, in which all things can expand and be completely themselves. This is the attitude which pervades his *St. Francis in Ecstasy* (II, PL. 253); although full of light and natural details, it is painted with a rigorous sense of the individual identity of forms. In many of Bellini's later works, forms are more fused in the general atmosphere. He loved especially the soft, palpable air of a summer evening, a time when forms seem to give back the light they have absorbed all day. Bellini's landscapes are the supreme instance of natural facts transfigured through love. Few artists have been capable of such universal love embracing every twig and stone, the humblest detail as well as the most grandiose perspective; it is a state of being that can be reached only through profound humility.

After Bellini the landscape of fact disappears from Italy, and — with one great exception — from northern Europe, not to reappear until the mid-17th century. The notable exception is Pieter Bruegel the Elder. This master of naturalistic landscape was probably born in the 1520s, after the death of Bosch, one of the great geniuses of fantasy, from whom he learned much. Italian landscape painting at the time was entirely dominated by the elaborate fantasies of mannerism, in which the essential ingredients were a high viewpoint, a range of craggy mountains, and a distant prospect of river and seacoast. Bruegel mastered this mannerist style, and it remains the scaffolding for much of his work. Many of his paintings are, indeed, landscapes of fantasy. But he was so continuously excited by what he saw, and possessed such prodigious powers of observation and memory, that his true place is with the masters of fact.

In so far as a progression can be traced in Bruegel's short career, it is in his ability to make his criticism of life implicit rather than explicit. He begins with proverbs and allegories in which landscape is a setting and an accessory, and proceeds to the great landscapes in which the accidents of human life are one with the weather and the seasons. Few works of art are less in need of commentary. His compositions are full of reminiscences of early Flemish painting — of Hugo van der Goes (PL. 10), the Van Eycks, and even the Limbourg brothers; but he was also capable of anticipating the Dutch landscape painters of the 17th century. The confidence with which he looks back and forward in time and seizes any weapon that comes to hand is almost Shakespearean and is used for a similar end: the expression of an all-embracing sympathy with humanity. For although his human beings, their faces simplified to mere disks, seem sometimes to lose their individuality and become part of the mechanism of the universe, in the end it is the struggles and scant animal pleasures of their lives that really absorb him and dictate the character of his landscapes. Bruegel's work remains unique; though he had many imitators, none was able to use his style for a fresh creative purpose. The course of landscape painting was then set toward a totality of impression and away from the rich accumulation of incidents with which Bruegel's landscapes were filled.

The landscape of fact that directly influenced, or even created, 19th-century vision was the landscape painting of 17th-century Holland. It bears no resemblance to that of Bruegel, and its kinship with the backgrounds of Bellini and Pollaiuolo depends solely on similarity of aim, for these early Italian landscape painters were entirely unknown in Holland. It can be accounted for in no single way, but answers in three different modes may aid in understanding the situation.

The first basis is sociological. The landscape of fact, like portraiture, is a bourgeois form of art. Seventeenth-century Holland was the great, the heroic epoch of the *bourgeoisie*, and its art reflected the desire to see recognizable experiences portrayed. The Dutch felt the need for identifiable, unidealized views of their own country, the character of which they had recently fought so hard to defend. The second answer is philosophical. This was an age in which men once more felt free to ask questions about the workings of nature. The curiosity of the Renaissance had been repressed by the Counter Reformation, though never quite destroyed. Now that wars of religion were over — in Holland at least — a revival of science was possible. Landscape painting may also be seen as a symptom of quietism; after the pandemonium of religious war, men needed an interval of calm. The third answer lies within the art itself. By 1600 the tradition of mannerist landscape was exhausted, and the old Netherlandish love of representing the thing as seen, which had never been completely smothered, was ready to reassert itself.

It would be a mistake to suppose that Dutch landscape painting is admirable in proportion to the degree of fact it contains. The most naturalistic painters — Adriaen van der Velde, for one — are by no means the most inspired, and some of the greatest pictures of the period are ideal landscapes, such as Rembrandt's *The Mill* (Washington, D. C., Nat. Gall.) and Hercules Seghers' mountain prospect in the Uffizi (II, PL. 214). As a painter, Seghers must be reckoned as one of the great masters of the landscape of fantasy, but his etchings and drawings show him to have been the first acute observer of the distinctive Dutch scenery, both its oak woods with grassy paths and its panoramic views over flat country (IV, PL. 435; V, PL. 310). Thirty years later Hobbema (V, PL. 309) and De Koninck were to carry out these graphic observations in paint.

This difference in approach between drawings and paintings substantiates the immense prestige of ideal landscape, a disparity seen nowhere so clearly as in the work of Rembrandt. One of the most sensitive and accurate observers of fact who has ever lived, as time went on he could immediately find a graphic equivalent for everything he saw. In his landscape drawings of the 1650s, every dot and scribble contributes to an effect of space and light; problems that had baffled earlier landscape painters — for example, the difficulty of the middle distance, of getting into a picture smoothly from a low point of view — did not exist for him. Yet, when he came to paint, he felt that all these observations were no more than the raw material of art. To Rembrandt, as to Rubens, landscape painting meant the creation of an imaginary world, vaster, more dramatic, and more fraught with associations than the world we can perceive for ourselves. His greatest landscapes, with their solemn, legendary atmosphere, in the end may seem more satisfying than the transparent records of perception, however miraculous their precision and delicacy.

Holland is a country of great skies, and it was the sky that inspired those Dutch painters who first made an impression of landscape their entire subject. The oldest of this group, Jan van Goyen (PL. 14), had inherited the mannered picturesque of "Velvet" Brueghel and Jodocus (Joos) de Momper; but the loving delicacy with which he observed every nuance of a cloudscape gradually extended to the scene as a whole, and an initially artificial style became true landscape painting. When sky was reflected in water (II, PL. 215), there was achieved that unity of luminous atmosphere which is one of the chief qualities of Albert Cuyp (PL. 14) and the essence of Jan van de Cappelle and Jan van de Velde. A second-rate painter of sea and sky may enchant us, while an artist as painstaking and skillful as Hobbema may grow tedious because, to cite one aspect, the elaborately described trees in his woodland scenes are not subordinated to a general principle of light. To this judgment there is one exception: Jacob van Ruisdael, who must be reckoned the greatest master of the natural vision before Constable. Though in fits of depression he worked without a spark of feeling or vitality, when his emotions were rekindled he felt the grandeur and pathos of simple nature with Wordsworthian force. This feeling he expressed — as all

the greatest landscape painters have done — through the telling disposition of large areas of light and dark, so that even before viewing his pictures at short range one is aware of their dramatic power (PL. 14); only upon close scrutiny does one find them full of observed facts. Once more light removes these observations to a new plane of reality. Here, however, light has a new character: it is no longer static and saturating, as in the work of Bellini but, rather, is in continual movement.

In the mid-17th century the Dutch school also perfected the painting of towns and buildings. This was part of a curious revival of classic principles of design, as opposed to the mannerist principles of the earlier genre painters. Of this revival Jan Vermeer was the most distinguished and consistent representative, but for a time it also affected De Hooch, Terborch, Metsu, and even Steen, and it is the basis of such exercises in perspective as the architectural pieces of Saenredam, Berckheyde, and De Witte (V, PL. 317). Within an over-all geometrical structure the Dutch could introduce as much detail as they liked without appearing trivial, in addition to a greater or lesser realization of atmosphere. The rendering of atmosphere reached a point of perfection that, for sheer accuracy, has never been surpassed: the Vermeer *View of Delft* (PL. 20). Not only does Vermeer display an astonishing subtlety of tone in this uncanny approximation of a color photograph, but he has used it with almost inhuman detachment. He has not allowed any one point in the scene to engage his interest and has set everything down with a complete evenness of focus. But the more one studies the *View of Delft* the more artful it appears, the more carefully calculated its design, and the more consistent all its components. No doubt truth of tone adds to the viewer's delight, but mere accuracy could not sustain one long without other qualities.

By the end of the 17th century the painting of light had become a trick, and that underlying sense of the importance of nature in daily life — which gave value to statements about natural appearances — had disappeared. Landscape painting was mere picture-making according to certain formulas; fact was confined to topography. Occasionally, when the topographer-artist could not suppress his interest in the beauty of atmosphere, the landscape of fact was once more raised to the condition of art. The impact of a fresh scene roused Canaletto to transcend his ordinary style. He painted *The Stonemason's Yard* (London, Nat. Gall.) because the scene appealed to him, not for sale to some traveling Englishman; his first views of the Thames express his pleasure in a new kind of light. Canaletto's rival Francesco Guardi had an impressionist's quickness of eye. He could catch the most delicate tone of a sail against the sky, the most tremulous light reflected from a canal on the faded plaster of a Venetian palace. But he was committed to a rococo principle of composition and a brilliant calligraphic style of drawing that, seductive as it is, belongs to the world of artifice. Naturalistic painting was impossible in the 18th century, as the case of Gainsborough confirms. In a letter to a patron he states that he has "... never seen any place that affords a subject equal to the poorest imitations of Gasper or Claude."

Landscape of fantasy. Regarding previous landscape painting as too tame and domesticated, artists began as early as the 15th century to explore the mysterious and the unsubdued aspects of nature. Working for an urban population that had long since learned to control natural forces, they could view former menaces such as flood with a kind of detachment and use them purposefully to excite a pleasing horror. Painting an aspect of nature that expressed the dark convolutions of the human spirit, making conscious use of disturbing shapes and symbols, they are what are now called "expressionist" artists. Expressionist art is fundamentally a northern and anticlassical form, which prolongs in both its imagery and complex rhythms the restless, organic art of the epoch of the folk migrations. It is forest-born, and even when it does not actually represent fir trees and undergrowth — as in German painting it almost invariably does — their gnarled and shaggy forms dominate the design.

The two painters who expressed this attitude to nature in its purest form came from the forests bordering the Rhine and the Danube: Grünewald and Altdorfer. Of the two, Grünewald is the greater and the more disturbing; his Isenheim Altar (VII, PLS. 85–89) is perhaps the most phenomenal picture ever painted. He was profoundly influenced by the mystical writings of his time and by the revivalism that preceded and accompanied Luther's reforms. As with all revivalist art, everything in his pictures is designed to have the most jarring and immediate effect upon the emotions. The landscapes on the outer wings of the altarpiece are terrifying. The wilderness in which St. Paul has found release from the world is of a desolation never again achieved in painting; and Grünewald has discovered, in the ragged fingers of moss that drip from every leafless twig, a perfect symbol of decay. Their repeated verticals impose a ghastly stillness broken only by the fall of a rotten branch. The landscape behind St. Anthony's hideous ordeal is more supportable only because it is really too extravagant in its manipulations of the machinery of horror (IV, PL. 180).

Altdorfer, though on a lesser scale than Grünewald, is more representative of the German spirit; in fact, he is the most German of all painters, for although his eye penetrates deeply into the northern forest, with its twisting tendrils and undergrowth, its pools and mosses glowing like enamel, he views them with a certain *Gemütlichkeit* — a snugness, as though from a cottage window — whereas Grünewald walks abroad among his terrors with starting eyes. Altdorfer's little *St. George and the Dragon* (ca. 1511; Munich, Alte Pin.) is at the opposite pole to the great figure pieces that were being painted at this time in Italy. In it man, even though he be St. George, almost disappears amid the luxuriance of the forest. Trees fill every inch of the picture: they are not the orderly decorative trees of tapestry landscape, with their gifts of fruit and blossom, but menacing organic growth, ready to smother and strangle any intruder.

In these landscapes of Grünewald and Altdorfer one sometimes has the feeling that the world has been newly created, and they were, in fact, painted at a time when men were again taking an interest in their origins. The most imaginative interpretation of primitive life was made by a Florentine, Piero di Cosimo, in a series of decorative panels, one of which, *The Forest Fire* (Oxford, Ashmolean Mus.), was the first Italian landscape in which man is of no importance. In this series the pattern for the representation of trees and hills was taken from Flemish models; but the lonely and neurasthenic Piero di Cosimo, although he affected an extreme conventionality in moments of depression, was capable of turning these formulas into personal symbols. He was obsessed by pendent cliffs and bulbous trees, which are an unusually direct and overt expression of his unconscious mind.

The emotive effect of flaming light, or actual flames, seems to have been recognized in the 1490s, and it was part of the repertoire of Hieronymus Bosch. In this, as in so much of his work, he may have been inspired by medieval miniatures or, more probably, by the frequent representation of Hell in miracle plays. The esthetic effectiveness of unexpected red and orange in a pool of darkness added to its popularity; and in the next 30 years the characteristic flames of Bosch break out in almost every landscape. In particular, the paintings associated with the name of Joachim Patinir, which constitute the first series of pure landscapes, rely on Bosch's fire device to alleviate their somewhat prosaic character.

The appearance of fire in Italian painting was in most cases traceable to the direct influence of Bosch, for much of his work was in Italian collections, particularly in that of Cardinal Grimani in Venice. There it was seen by the ardent young romantic Giorgione; immediately fire breaks out in his backgrounds, and he chooses subjects that justify its presence, such as the story of Orpheus and Eurydice. Another Giorgione design that shows very markedly the influence of Bosch, a work surviving only in an engraving by Marcantonio Raimondi, is the sinister piece which used to be known as *The Dream of Raphael.* Two naked women, of full Venetian sensuality, lie sleeping at the edge of a lake. Beyond them the sky is menacing

and a castle has broken out in flames. The sleepers are undisturbed, but they are soon to be the victims of four disgusting monsters, which advance toward them along the bank. Here the supreme interpreter of harmony between man and nature materializes those mysterious and malevolent forces which, in man's mind no less than in nature itself, lie in wait to poison his dreams of epicurean tranquillity. Giorgione must have inspired such mannerist romantics as Lorenzo Lotto, Dosso Dossi, and even Domenico Beccafumi (PL. 295), who injected fire effects into their paintings from 1520 to 1550. But there is no doubt that Lotto had direct contact with German painters as well. In his earliest painting, *A Maiden's Dream* (ca. 1498; Washington, D. C., Nat. Gall.), the trees and their relation to the distant landscape show unmistakably the influence of Dürer, who was in Venice in 1494–95, and foreshadow the forest landscapes of Altdorfer and Cranach. Lotto's *St. Jerome in the Wilderness* (1506; Louvre) contains rocks and trees remarkably similar to those in the drawings Dürer did on his journey home from Italy in 1495.

Whereas in the north fantastic form was dominated by the knotted shapes of trees, in Mediterranean art a similar formal impulse was expressed through the old Byzantine tradition of jagged rocks. The strange Gothic mountains of Melchior Broederlam (V, PL. 277) and Lorenzo Monaco (PLS. 199, 201) continued far into the 15th century, and in its decadence this trend achieved a point of unreality that has not been equaled since. One of the earliest attempts to retain and justify the iconographic motif of fantastic rocks by means of science and reason was made by Mantegna in his *Virgin of the Quarries* (Uffizi).

The culmination of this union of science and fantasy is to be found in the work of Leonardo da Vinci. The direction of Leonardo's scientific researches was generally established by his esthetic appetites. He loved certain forms, he wanted to draw them, and while drawing them he began to ask questions: why were they that shape and what were the laws of their growth? This is true of his interest in fantastic rocks. He began, in *The Annunciation* (PL. 116) and in *The Virgin with the Flowers* (Munich, Alte Pin.), by accepting the rocks of convention, and about 1483 his love of fantastic rock forms led to that peculiar sample of personal iconography, *The Virgin of the Rocks* (PL. 121). At this date he had no particular interest in science: the first scientific entries in his notebooks date from a few years later. But, as time went on, his insatiable curiosity prompted him to ask more and more questions about the character and origins of rocks, until finally his researches into geology led to the most original of all his scientific speculations. His studies of strata show a genuine understanding of the forces leading to their formation. This empirical knowledge is implicit in his later landscapes, but it is used in the service of his imagination. In his *Treatise on Painting* Leonardo advises the painter to look at stains on walls, stones of uneven color, embers of the fire, clouds, and mud and then allow the imagination free play. Mountain landscapes, figures in violent action, expressions of faces, clothes, and "an infinity of things which you will be able to reduce to their complete and proper forms" will at once be suggested to the inventive spirit. This famous passage illustrates an important element in the landscape of fantasy: the manner in which it evolves from a chaos of forms — out of the undergrowth, the firelight, or the clouds — through an interplay of the conscious and the unconscious mind. The backgrounds of the *Mona Lisa* (PL. 126) and *The Virgin and Child with St. Anne* (PL. 122) conform entirely to this character, landscape of a primitive world in which man has hardly established a foothold.

Later in life the scientific subject that occupied his mind until it became an obsession was the movement of water. The rhythmic qualities of moving water first fascinated him esthetically, and this interest led to an analytic approach. And again, he ultimately used his researches to enhance his imaginative fantasies. The drawings of the deluges, in which Leonardo concentrated all his knowledge of rock forms and hydrodynamics, present a most disturbing juncture of the medieval and modern worlds. In these the landscape of fantasy is not nature before man has tamed it but the forces of nature rising in revolt against man, with his absurd pretense to ignore them or use them for his advantage. Leonardo had arrived at a vision of destruction in which symbol and reality seem to be at one.

The feeling for the independent life of nature that was the mainspring of Leonardo was soon to be lost in mannerism. Sixteenth-century mannerism employs the exciting elements of picturemaking regardless of their truth or relevance; and although it uses the forms of classicism as far as possible, it reveals in accent and rhythm that great deposit of Gothicism which the Renaissance had not strained out of Italian art. It was characteristic of the mannerists that they should take pleasure in the fantastic rocks of Gothic painting, but should justify this taste by using forms derived from the decorative landscapes of antiquity. From such landscapes in Hellenistic style comes the compositional scheme of mannerist landscape, with its high point of view, its distant prospect of mountains and hills on one side of the picture, and a seacoast or estuary on the other. It is a scheme foreshadowed in Altdorfer and present in the frankly antiquarian decorations of Polidoro da Caravaggio in S. Silvestro al Quirinale, Rome. The pure mannerist landscape, with its complete repertoire of tricks and a minimum of firsthand observation, is exemplified in the work of Niccolò dell'Abate, who subordinates everything to an ideal of elegant picturemaking. Naturally this superficial style was at its best when used for its original purpose of interior decoration; and nowhere is it more charming than in the room of landscapes that Paolo Veronese painted about 1560 in Palladio's Villa Barbaro at Maser. In most of them he has followed the antique model, with its elaborate architecture, bridges, and jetties and a dark foreground tree; but he has also allowed himself the expansive Venetian skies that irradiate all his work.

This decorative use of landscape is the most harmless form of wall decoration ever devised, and so has continued to be fashionable. But it is an approach to the subject at the furthest remove from that of Bellini, Constable, Cézanne, and the other patient quarriers of natural appearances. In fact only two of the great mannerists produced landscapes of any significance — Tintoretto and El Greco. With Tintoretto, nature was caught up in the rushing wind of his genius and made to serve the purpose of his colossal invention. The background of his *Flight into Egypt* is a drama of light and shade as exciting as an Altdorfer; the desert landscapes of the two panels of Mary Magdalene and St. Mary of Egypt (Venice, Scuola di S. Rocco; XII, PL. 372) are made up of twisted forms that communicate the artist's creative energy through the representation of organic life. Switch off this current of energy, leave only the nervous gestures, and one has those minor picturesque landscape painters Mola, Testa, and Magnasco, whose caves, ravines, and beaches are found diverting in an age of decadence. El Greco has left us one unforgettable landscape, his *View of Toledo* (New York, Met. Mus.). It is a true expressionist work, a picture of the artist's own mood, and an exception to all rules. Far removed from the spirit of Mediterranean art and from the rest of 17th-century landscape painting, it has more the character of 19th-century romanticism.

The compositional scheme of mannerism also provided a scaffolding for one of the greatest of all landscape painters, Peter Paul Rubens. He cannot, of course, be classed with the painters just considered. Tintoretto probably never paused to draw the correct form of a single leaf; whereas the drawings Rubens did from nature are among the most sensitive and observant ever made. But although this prodigious power of recording natural details was often transferred to his pictures, Rubens cannot be called a painter of fact. Nor have his landscapes the literary character and the backward glance to a golden age that one may call Virgilian. They must therefore be discussed here, although the word "fantasy" is altogether too weak to describe their imaginative richness and warmth (PL. 19; XII, PL. 332). Just as Shakespeare reworked the stock themes and situations of Elizabethan drama, so Rubens, by the wealth of his imagination, his unfailing vitality, and the richness of his pictorial vocabulary, has forced the worn-out scheme of mannerist landscape to yield new splendor. His earlier landscapes,

such as the *Shipwreck of Aeneas* (Berlin, Staat. Mus.) and the *Philemon and Baucis* (Vienna, Kunsthist. Mus.), conform superficially to the pattern that is found, for example, in the engravings of Bruegel, but his variant has become more complex and more dynamic. The mannerist desire to keep all forms in perpetual flux has never been more marvelously realized in landscape than in *Philemon and Baucis*. But these breath-taking arcs and spirals are based on a series of horizontals, calculated with a classic sense of interval.

The Watering Place (London, Nat. Gall.) introduces a different scheme of composition. It is seen from a low point of view, and the construction of the towering central mass is a perfect example of the baroque: it has the sweeping movement, the twist and countertwist which are the essence of baroque architecture and which give it a unity and power that transcend the perverse rhythms of the preceding style. As a reading of nature, however, it still belongs to the romantic tradition of the north. The trees and undergrowth are of an overwhelming luxuriance. Part of the primeval forest, they writhe and surge like monsters. Rubens himself recognized the character of his romanticism and captured it fully in the painting *Tournament before a Castle* (Louvre). Like Altdorfer seeing the connection between the landscape of fantasy and the Gothic past, he filled the foreground of his picture with knights in armor. Beyond the castle, hanging low over the landscape, is one of the large red suns with which Rubens, in his later work, is so prodigal. No one, before Turner, has painted richer and more varied sunsets, ranging from fiery orange to the mysterious milky sun of the *Birdcatcher* (Louvre). Rubens was also a master of raging skies. In the *Philemon and Baucis* the clouds portend a deluge; in the *Shipwreck of Aeneas* their darkness is made more lurid by a flaming beacon on the distant promontory. Here, and in the moonlight landscape in the Seilern Collection (London), Rubens returns to the night scenes that had so stirred the imaginations of Altdorfer, Leonardo, and Giorgione.

Night is not a subject for naturalistic painting. A large area of dark paint cannot be made to look convincing by optical processes alone; it has to be transmuted through the medium of the poetic imagination. About 1600, when darkness was much in vogue, there appeared in Rome a landscape painter whose work was a strange and evocative concentration of poetry, the Frankfurt-born Adam Elsheimer (PL. 13). Like Edgar Allan Poe, he was one of those artists whose influence was much beyond his own achievement. Rubens, Rembrandt, and Claude each took from him something decisive in their development, and — what is more extraordinary — each took something different. Elsheimer died in Rome in 1610, after having worked there for the preceding ten years. He therefore used the current Roman landscape style, that of Brill and Domenichino (PL. 15), but his spirit is that of Altdorfer. He paints classical scenery, but with a strangeness and intensity of light, an enameled quality which is entirely German and which takes one back beyond Altdorfer to Lukas Moser of Tiefenbronn. It was Elsheimer who brought to a new stage of realization the nocturnal fantasies of a hundred years earlier. In his *Flight into Egypt* (VI, PL. 159), he carried them as near to the limits of truth as such subjects can go without entirely sacrificing the element of decoration that must exist in any picture.

Just as in the 18th century, that winter of the imagination, the landscape of fact degenerated into topography, so the landscape of fantasy degenerated into the picturesque, more particularly into that strain of the picturesque which derived from Salvator Rosa (PL. 16). He was, in a minor degree, a kind of Byron who opened a new vein of sentiment and discovered the rhetorical form by which it could be conveyed. His sentiments were exaggerated and his means of expressing them often commonplace; his enormous popularity only affirms that the 18th century needed some escape from its own oppressive rationalism.

Ideal landscape. Before landscape painting could be made an end in itself, it had to be fitted into the ideal concept to which every artist and writer on art subscribed for 300 years after the Renaissance. The delight in imitation, which had satisfied Alberti and Bellini, was not enough for Lomazzo and the Carraccis. In both content and design, landscape must aspire to those higher kinds of painting which illustrate a theme — religious, historical, or poetic. And this cannot be done simply by introducing a small group of figures enacting the Flight into Egypt or the story of Eurydice but must be effected through the mood and character of the entire scene. The features of which it is composed must be chosen from nature, as poetic diction is chosen from ordinary speech, for their elegance, their ancient associations, and their faculty of harmonious combination: *Ut pictura poesis.*

Two poets of antiquity, Ovid and Virgil, furnished the imagination of the Renaissance artists. Ovid, with his clear and detailed descriptions of the fabulous, was the favorite of figure painters; but Virgil was the inspiration of landscape. The reason lies not only in the delicate suggestions of scenery that occur in the *Aeneid* but also in the myth of ideal rusticity, of which he was the master. This was the most enchanting dream that has ever consoled mankind, the myth of a golden age in which man lived on the fruits of the earth, peacefully, piously, and with primitive simplicity. As a conception of the early history of mankind, it is the exact opposite of that which produced the landscape of fantasy.

Virgilian landscape is essentially an evocation of the antique world, with all its fullness of life and its confidence in the body, but also with some qualities the ancient world lacked, some half-lights, some backward glances to the dreams of the late Gothic period. Foreshadowing this new prospect is the beautiful *Allegory of Souls* by Giovanni Bellini (Uffizi); this is a descendant of the paradise garden, but one in which the figures breathe the palpable atmosphere of a warm summer evening. The foreground is occupied by saints, but cupids (however Christianized) play around the Tree of Life, and in the landscape a centaur is lurking near the Cross.

In spite of its sacred theme, this is really the first example of that kind of painting which the Venetians called "poesie." Such pictures must have been a formative influence on the youthful Giorgione, whose earliest landscapes — backgrounds of religious works painted when he can have been no more than a boy — show astonishing skill. The eye is led into the background firmly and smoothly, but with some complexity. Natural objects, leaves, and stones are rendered with extraordinary precision, but already they are removed from the landscape of fact. Giorgione inherited Bellini's sense of precious light, and it is the golden light and the flowing rhythm in the lines of trees and contours that make his earliest landscapes poetical. Giorgione's natural lyricism was developed by association with the group of poets of the so-called "Arcadian movement" at the court of Caterina Cornaro in Asolo, near his native Castelfranco, and in particular with that arbiter of classic elegance Pietro Bembo. An Arcadian spirit is present in Italian poetry as early as Boccaccio, but its great popularity was due to Jacopo Sannazaro, whose *Arcadia* appeared in the 1490s. Apart from the general charm of its subject matter to a landscape painter, the *Arcadia* is full of pictures, the kind of subject that was to delight the painters of Venice during the next 50 years.

The structure of the new Arcadian landscape follows a regular pattern. On either side are dark masses of trees and rock, like wings of a theatrical scene, which leave the center of the picture free. Even the figures, which are completely at one with the landscape, are sometimes placed at the side; sky and distance take the principal place. It is the composition that, with every refinement of variation, was to form the basis of Claude Lorrain's work. It occurred in one of Giorgione's earliest paintings, *The Finding of Paris* (now lost), and it also underlies his one essential and indubitable work, that quintessence of poetic landscape, *The Tempest* (VI, PL. 186). *The Tempest* is one of those works before which the scholar had best remain silent. No one knows what it represents; even Marcantonio Michiel, writing almost in Giorgione's day, could offer no better title than "a gypsy and a soldier." There is little doubt that it is a free fantasy which grew as Giorgione painted it; X rays have shown that he was an improviser, who changed his pictures as he went along, and that this composition originally contained another naked woman, bathing her feet in the stream.

In a masterly essay on the school of Giorgione, Walter Pater points out that many pictures of that school have musical themes; and it is precisely this musical quality, this feeling that "life itself is conceived as a sort of listening," which distinguishes Giorgione from his younger contemporary Titian. The most complete and satisfying of Titian's early landscapes are those that lie on either side of the *Sacred and Profane Love* (Rome, Gall. Borghese). But in the heads of the twin Venuses (for that is what they are) is seen a proud, sensual look entirely different from the pure, gentle, abstracted expression of Giorgione's women. The appeal of this picture to the emotions is due very largely to the mood of the landscape, achieved by the beauty of the evening light; and this mood dominates the painting of the time. The very group of buildings that lies behind the earthly Venus appears in two other pictures, the *Sleeping Venus* by Giorgione (VI, PL. 195) and the still-debated *Noli me tangere* in London (Nat. Gall.), and in each case it gives the keynote of the entire picture.

Although Titian was primarily a painter of portraits and figure compositions, the trees and mountains with which he enriched his backgrounds are of great importance in the history of ideal landscape, for they provided the forms of vegetation employed by Claude and Poussin. Anyone who has visited Cadore will recognize that the impressions of Titian's native place remained with him all his life. The rocky hills with their thick clusters of trees, the rushing streams, and blue mountain distances are seized upon with Titian's sensual power and crowded into the small background of a portrait. Occasionally they are given more space, and one recognizes the origin of all Carracciesque landscape. The great hunting landscapes by the Carraccis in the Louvre are no more than freer and more crowded versions of Titian's *Vènus du Pardo*, which hangs opposite them; and from the lost *St. Peter Martyr* — perhaps the most copied picture in the world — there flowed an unending series of landscape compositions during the 17th century. Titian's appetite for nature gives to his landscapes a magnificent fullness. His trees, in particular, have a weight of leaf and roundness of trunk never surpassed, and it is not surprising that Poussin and Rubens, Constable and Turner, all looked on him as a source of inspiration. But he has not enlarged the field of landscape composition as Giorgione has. His planes lie behind one another in a purely theatrical manner, and he is not greatly concerned with tone, although in such late works as the *Rape of Europa* (Boston, Gardner Mus.) his distances are painted with a glorious freedom. To find the Titianesque scheme of ideal landscape, one must look in the numerous drawings and engravings associated with the name of Campagnola, in which these characteristic traits persisted without a break to the time of the Carraccis. Through these works, no less than through the study of Titian's paintings, the Bolognese continued uninterruptedly the tradition of the first ideal landscapes.

At their best, as in the lunettes in the Galleria Doria Pamphili (III, PL. 89), the landscapes of Annibale Carracci are admirable pieces of picturemaking, in which agreeably stylized parts are built up into a harmonious whole. There is even at times a note of authentic poetry, though it is faint and guarded compared with the poetry that, at almost the same date, Elsheimer was able to infuse into the same stylistic materials. But, in the end, these eclectic landscapes are of interest only to historians. The landscapes of Brill (PL. 13; V, PL. 304) and Domenichino (PL. 15) are without joy in the perception of fact, without an imaginative sense of the force and mystery of nature, and above all they lack feeling for the unifying element of light. Without these life-giving qualities, no amount of idealization will justify landscape painting as an art form.

It is by these qualities, no less than by his sense of Arcadian poetry, that Claude can make the formal vocabulary of his predecessors fresh and vivid to the present day. Claude Gellée, called Lorrain, the true heir to the poetry of Giorgione, was born in 1600 in Lorraine, but went to Rome as a youth and remained there almost uninterruptedly until his death in 1682. Very little is known about his life, apart from a short biographical note by a fellow painter, Joachim von Sandrart, who accompanied him on his early painting expeditions. He tells that at that time Claude's study of nature was limited to contemplation, particularly of sunrise and sunset. "Seeing that I worked from nature," he adds, "he began to do the same himself"; and Sandrart later makes it clear that Claude not only drew but painted from nature, especially for his distance effects. This is contrary to anything one is told about the landscapes of the old masters, and it is not a method suggested by a first impression of the paintings themselves, although careful scrutiny of Claude's work shows effects that could hardly have been carried in the memory. No great painter ever lived so completely within his resources as Claude. Unlike those of such splendid prodigals as Rubens, his pictures always suggest a tactful and farsighted economy. At first sight their extreme simplicity may suggest a certain lack of resource; it is only upon becoming familiar with them and comparing them with the work of imitators that one realizes how rich is the observation Claude has put into every branch, how extremely subtle the tonality of his foregrounds, and how delicately drawn the waves and ripples which catch the light of his golden skies.

Behind these seemingly simple pictures there was an immense amount of preparation. First came the sketches from nature, the works of Claude that most clearly disclose the gulf which separates him from the Carraccis, for these show a visual responsiveness hardly different from that of the impressionists. Sometimes they are careful studies of detail, sometimes entirely impressionist in their sense of light; sometimes they have a Chinese delicacy of accent (PL. 204). In all of them the general disposition of mass is masterly, and no one will deny their ravishing beauty, freshness, and variety. But it is important to remember that Claude never thought of the sketches as ends in themselves. His mind was always looking forward to their use as part of a whole composition; and parallel with detail studies from observation, he made sketches of ideas that could be used as the basis of fully developed pictures. Then came the actual studies for pictures carried far toward the final composition, some — such as the *Ascanius and the Stag* (Oxford, Ashmolean Mus.), done when Claude was eighty-two — setting the completed version down exactly. These are the drawings which Claude himself valued and which were collected by his contemporaries, and if studied with something of the patience that went into their composition, their poetic fullness is extremely impressive. Finally come the finished paintings themselves, about which there is little to say, for anyone who looks at them in a receptive frame of mind must surely be touched by their exquisite poetry. There is never a false note. Claude could subordinate all his powers of perception and knowledge of natural appearances to the poetic feeling of the whole. The world of his imagination is so clear and consistent that nothing obtrudes, nothing is commonplace, nothing is done just for effect. As with the plays of Racine, which give the same feeling of devotion to an ideal whole, this is not so much the result of self-discipline — an act of will — as of a natural habit of mind.

Claude nearly always conformed to an underlying scheme of composition. This involved a dark coulisse on one side (hardly ever on two), the shadow of which extended across the first plane of the foreground; a middle plane with a large central feature, usually a group of trees; and finally, two planes, one behind the other, the second being that luminous distance for which he has always been famous, and which he painted directly from nature. Much art was necessary to lead the eye from one plane to the next, and Claude employed bridges, rivers, cattle fording a stream, and similar devices; but these are less important than his sure sense of tone, which allowed him to achieve an effect of recession even in pictures where every plane is parallel. Naturally he used many variants of this compositional scheme. Often he dispensed with the central feature, as in that enchanting work which by its title alone evokes the spirit of Claude, *The Decline of the Roman Empire* (Trustees of the Late Duke of Westminster). More rarely he dispensed with the coulisse, as in *Morning* (Leningrad, The Hermitage) or *Jacob with Laban and His Daughters* (London, Dulwich College Picture Gall.). This method of designing by successive planes that sometimes, at first sight, seem little more than silhouettes gave unusual prominence to the shape of his dark

masses. Yet, however refined and carefully balanced in the final picture are the shapes of his trees and rocks, they always retain their natural character. In spite of the extreme formality, nothing in Claude is reduced to formula.

Only when Claude was past middle age do spirit and design attain their full expression. His greatest poems — the *Times of the Day* (Leningrad, The Hermitage) and *Acis and Galatea* (Dresden, Gemäldegalerie) — were painted when he was over sixty. It is these later works that, whatever their ostensible subject, are fullest of the Virgilian spirit. His seaports (PL. 205), painted in the 1640s, may evoke that moment when Aeneas leaves the grandeur and certainty of Carthage for a shining unknown distance. But the Virgilian element in Claude is, above all, his sense of a golden age: grazing flocks, unruffled waters, and a calm luminous sky, images of perfect harmony between man and nature but, as he combines them, touched with a Mozartean wistfulness, as if this perfection could last no longer than the moment in which it takes possession of the mind.

The great figures in history have a curious way of appearing in complementary pairs. The complement to the gentle, inarticulate Claude is the stern Cartesian, Nicolas Poussin. Unlike Claude, much is known about Poussin, and everything that is known proves that the intellectual content of his pictures cannot be exaggerated. Every incident, no less than the disposition of every form, is the result of profound meditation. No art could be further from the inspired improvisation and lyric flow of Giorgione; yet the early Poussin landscapes, the backgrounds of his bacchanalian scenes (XI, PL. 231), go back to Titian's mythological paintings for Alfonso d'Este (Prado; London, Nat. Gall.), which the French master is said to have copied.

Poussin did not paint pure landscapes until about 1648, when he was fifty-four, and one may wonder why, holding the opinions he did about the inherently moral character of painting, he should have attempted the subject at all. But in spite of his theories, Poussin had an immense appetite for nature; and one may also guess that he was ambitious of achieving a fresh conquest for the intellect by giving logical form even to the disorder of natural scenery. Poussin conceived that the basis of landscape painting lay in the harmonious balance of the horizontal and vertical elements in his design. He recognized that the spacing of these horizontals and verticals and their rhythmic relation to one another could have an effect exactly like the rhythmic trave or other harmonic devices of architecture; and in fact, he often disposed them according to the golden section. The chief difficulty of imposing this geometric scheme on nature lies, of course, in the absence of verticals. Landscape is essentially horizontal, and such verticals as exist are not always at right angles to the ground. To meet this difficulty Poussin, in his more schematic compositions, was fond of introducing architecture, which assisted his secondary purpose of giving an antique air to his subjects. His groups of buildings are of great importance in providing a modulus to the scheme of proportion on which the design is constructed; and sometimes, by means of blocks of masonry from a ruined temple, he is able to carry this pure geometry right through the composition. It was essential to Poussin's design that his verticals and horizontals should meet at right angles: indeed, if any upright line inclines slightly from the vertical, one may be sure to find another slightly off the horizontal that is at right angles to it. This insistence on the right angle is only possible when the main axis of the composition is parallel to the picture plane, and it thus accounts for the frontality of Poussin's landscape, a condition equally at variance with ordinary vision and with the serpentine recession of mannerism.

Since penetration into space is the essence of landscape, Poussin had to devise means of leading the eye back into the distance. No doubt the way most congenial to his mathematical mind was the central point of perspective, but he saw this as too rigid and artificial to be anything more than an occasional solution. He therefore fitted into his scaffolding of horizontals a subsidiary scheme of diagonals to conduct the eye smoothly and rhythmically into the background, and he was particularly fond of a diagonal path turning back on itself after about two-thirds of its journey. In the great myths Poussin painted between 1658 and 1665 this extreme geometrical ardor was relaxed or at least concealed. Although their subjects were often drawn from the myths of antiquity — Orpheus and Eurydice, Polyphemus, the giant Orion — and were no doubt inspired by fervid reading of the classics, they do not at all suggest the imaginative worlds of Ovid and Virgil. They are too grave, too weighted down with thought and the consciousness of original sin. In contemplating the work of Poussin, it is Milton who most often comes to mind, and the four famous landscapes of the seasons (XI, PL. 147), it might be noted, were painted during the years of the composition of *Paradise Lost*. Although Milton lacked Poussin's extreme rationalism, one finds in both the same early delight in pagan richness of color and imagery, the same strenuous and didactic middle period, and the same old age of renunciation and remoteness, which gave a new depth of poetic vision.

Poussin is one of those rare artists whose influence was wholly beneficial. He combined in full measure the real and the ideal; his scrupulous sense of design was nourished on observation, and his most exalted visions always remain concrete. Without his sense of truth, Sébastian Bourdon would have become a mere picturemaker; without his sense of form, Gaspard Dughet would have become a sort of Charles Jacques. As it is, they both produced fine landscapes. Dughet had a gift of straightforward naturalism that makes him the true precursor of the Barbizon school (PL. 15). Even the romantic side of Poussin was perpetuated in the work of Francisque Millet. That the influence of Poussin should have declined in the rococo period was inevitable, but in the more heroic age of classicism his spirit was revived. Through Pierre Henri de Valenciennes (PL. 22) it dominated the early work of Corot; and although Corot himself was to discover that his true affinities were with Claude, the shadow of Poussin still falls across the landscapes of Millet and Pissarro, long before Cézanne made a more spectacular return to his principles.

In England Poussin has had few followers, for Claude gave to English painting a simpler scaffolding on which the native school could build. There was something in Claude's gentle poetry, in his wistful glances at a vanished civilization, and his feeling that all nature could be laid out for man's delight, which appealed particularly to the English connoisseurs of the 18th century. Sometimes his principles of composition, with their wings and stage trees, offered too easy a formula; but Richard Wilson (VI, PL. 440), at his best, understood the two chief lessons of Claude — that the center of a landscape is an area of light, and that everything must be subordinate to a single mood. As a result, although by no means a skillful artist, Wilson was a true minor poet.

Ideal landscape was closely connected with the landscape of symbols; both were inspired by a dream of the earthly paradise, and both sought to create a harmony between man and nature. By the 19th century the myth of a golden age lost its hold on the imaginations of poets and painters, and with this annihilation of an ideal past there vanished the concept of ideal landscape. William Blake's illustrations for R. J. Thornton's edition of Virgil's *Pastorals* may fitly bring the story to an end. These 17 tiny woodcuts, full of a most powerful poetry, inspired the visionary landscape that Samuel Palmer painted between 1825 and 1830, when he was living at Shoreham, remote from the world. Palmer invested nature with a spiritual quality and found every blade of grass and leaf and cloud was designed according to God's pattern. It was the vision of the Middle Ages and thus created a style very close to the landscape of symbols. In his use of decorative symbols and in the freedom and unconventionality of his means, Palmer surpasses that other romantic landscape painter whose brooding on nature is in many respects similar to his, Caspar David Friedrich. Palmer remains the last painter of Virgilian landscape, and with him there ends that beautiful episode in European art which from Giorgione's day had been a source of enchantment and consolation.

The natural vision. Early in the 19th century it was recognized that the status of landscape painting was changing, and very soon landscapes that at least purported to be close imitations

of nature came to hold a more secure place in popular affection than any other form of art. Such changes or expansions of popular taste usually have their origins in the vision of some great artist or group of artists; and although the wider appreciation of landscape arose from complex causes, in the end it was the genius of Constable that first discovered — and still justifies — the art of unquestioning naturalism.

No artist, of course, is entirely original. As a native of East Anglia, where he was born in 1776, John Constable had certainly seen Dutch landscapes in the local collections. His feeling for moving light, for shadows cast by clouds in a vast windy sky, must have derived from Ruisdael, as well as from his own observations, for Constable like all revolutionaries was an eager student of tradition. He had the capacity, found only in great artists, of entering into a way of painting apparently alien to his own and drawing from it those elements which are eternally vital and nourishing: that is, he could absorb without imitating. His letters are full of understanding of Titian, Claude, Richard Wilson, and Dughet, and quite late in life he would give up any commission in order to copy a Poussin or a Claude. This deep understanding of the tradition of European landscape was one of the reasons why Constable was able to present such a quantity of normal observation without the banality of later realists. Another reason was the importance Constable attached to what he called the "chiaroscuro of nature," a phrase he used repeatedly to describe two rather different effects. First he meant the sparkle of light, and this was the aspect of his work which is usually considered most original. The technical devices by which it was achieved, the broken touches and flicks of pure white applied with a palette knife, were a decisive influence on French painting. But by "chiaroscuro of nature" Constable also meant that some drama of light and shade must underlie all landscape compositions and give the keynote of feeling in which the scene was painted.

It is this sense of dramatic unity, as much as his feeling for the freshness of nature, which distinguishes Constable from his contemporaries. He recognized the fundamental truth that art must be based on a single dominating idea and that the test of an artist is his ability to carry this idea through, to enrich and expand it, but never to lose sight of it and never to include any incidents, however seductive in themselves, which are not ultimately subordinate to his initial main conception. Such an aim was relatively simple to achieve in classic landscape painting, where ideal forms could be used to prevent the multiplication of distracting details. But it is exceedingly difficult in the naturalistic landscape, Constable's discovery, where the impressions received from actual objects are the essential point of departure, and where the means of simplification have not already been shaped by generations of taste and style. Perhaps no other painter (except Rubens) has succeeded as Constable did in subordinating the infinite visual data of landscape to a single pictorial idea. Later painters have either killed the idea by embellishing it or have merely offered the first sensation without daring to build on it. The second course, though it produced much of the finest painting of the 19th century, restricts both scale and sense of permanence.

Constable has left a full record of his sensations in oil sketches that have become the most admired part of his work. But the struggle came, as he well knew, when first impressions had to be turned into large pictures. Of this process, for several of his compositions, there is evidence at every stage: there are the first tiny oils stating the theme of the pictures in terms of light and shade, the pencil studies that begin the definition of form, the detailed drawings from nature, and the larger oil sketches.

In Constable's greatest work naturalism is raised to a higher mold by the artist's belief that, since nature was the clearest revelation of God's will, the painting of landscape could be a means of conveying moral ideas. The final stage has been reached in the development of man's relations with nature, in an evolution that began with the timid confidence of the Middle Ages. Just as the last section might have been called "Virgilian landscape," so might this have been called "Wordsworthian," although Constable alone was a conscious exponent of the poet's beliefs. Both poet and painter found nature transformed by the philosophy of the 18th century into a mechanical universe working under the dictates of common sense; and both believed that there was something in trees, flowers, meadows, and mountains which was so full of the divine that, if contemplated with sufficient devotion, it would reveal a moral and spiritual quality of its own. Both men turned to rustic life because, to quote Wordsworth, "in that condition our elementary feelings co-exist in a state of greater simplicity, and consequently may be more accurately contemplated and more forcibly communicated." Both drew practically the whole of their emotive power from the scenes of their boyhood. Constable felt that his paintings of Dedham (PL. 23), the Stour River (III, PLS. 443, 444), and the surrounding country reached a higher emotional temperature than his other work. Above all, Wordsworth and Constable were united by their rapture in all created things. "I never saw an ugly thing in my life," said Constable.

Although a Wordsworthian attitude toward nature lies at the root of Constable's greatness, his immediate importance was due to pictorial rather than philosophical causes. His influence in England, the country of philosophical naturalism, was practically nonexistent, whereas in France it was immense. Contemporary critics speak of his influence on a school of French landscape painters, but little evidence of this survives before the rise of the Barbizon school in the late 1830s. Théodore Rousseau (PL. 22), who had seen *The Hay Wain* (III, PL. 441) and other Constables, had fundamentally the same aim as the English painter. He wished to make great compositions out of observed facts, and said: "J'entends par composition ce qui est en nous, entrant le plus possible dans la réalité extérieure des choses." His responses to nature, however, were very different: it was the static and not the dynamic that appealed to him, and his most genuine emotions were aroused by the absolute stillness of a summer day. Rousseau was an important painter; he created the academism of naturalistic landscape painting, which became the standard style for serious exhibition pieces at the official Salons. Perhaps if we knew more of his direct studies from nature, he would be rated more highly. But even so, he seems to have lacked the unself-conscious abandonment to nature on which the new vision depended; and this was the great gift of Corot.

Corot went to Rome as a student in 1825, the year after Constable's triumph at the Paris Salon. He does not seem to have participated in the general excitement, and never in his recorded sayings refers to Constable. His tastes were entirely classic, and he went to Rome with the intention of following in the steps of Poussin and that more recent master of classic landscape Pierre Henri de Valenciennes. The sketches he made from nature were undertaken simply as material for later compositions. All the classic landscape painters of the time made such studies, but they were not considered of more than private or professional interest and were generally destroyed. From the first, Corot brought to a current form certain qualities his fellow students lacked. He had a natural power of simplification that prevented his studies from ever becoming mere topography. He aided his powers of selection, as Claude had done, by the simple means of choosing as his main motif quite distant objects. This would have produced feeble results had it not been supported by a perfectly true sense of tone, inseparable from an equally unerring sense of design. On his first visit to Rome, the forms and colors of classic landscape had induced in him a state of passionate receptivity, and he had been able to absorb principles of composition that lasted him all his life. The sketches made on this first journey are, in some ways, the most remarkable he ever did, for his excitement engendered a freedom of handling he did not allow himself again until his last years; in those from subsequent visits, although there is a greater measure of observed fact, the touch is more discreet and the color less resonant.

Looking at these crystalline visions, it is hard to believe that they were practically never seen in Corot's lifetime and were intended only as material for large compositions which, by an irony of history, are never seen today. Corot's studies are in many respects more complete than those of Constable.

Fundamentally a classic artist, Corot had at the back of his mind a feeling for generalized form that allowed him to compose his sketches in larger and simpler units. But he seldom succeeded, as Constable had, in making them into exhibition pictures. His large compositions bear no relation to his sketches. Only one of Corot's Italian pictures, the *View near Volterra* (Washington, D. C., Nat. Gall.), retains the virtues of his studies; but in France, particularly in the pictures painted in the Morvan Mountains, he arrived at a satisfactory compromise, pictures of moderate size, firmly constructed and seen with absolute naturalness.

In the 1840s Corot gradually evolved a means of making his Salon pictures more his own. In *Le Vallon* (1855; Louvre) he brought to the creation of a new vision his fine sense of composition and tone and some of the lyric flow that was to fill his later work; at the same time there began the series of nymphs dancing among feathery trees, the subject that was to increase so disastrously the number of his admirers. One cannot blame Corot for adopting a genre which pleased both fashionable and critical opinion, for his own tastes inclined him in the same direction. From all his range of delicate visual experiences Corot came to be satisfied with one: shimmery light reflected from water and passing through the delicate leaves of birches and willows (III, PL. 459).

It is interesting to find that Corot, whose mind was anything but philosophic, had instinctively absorbed the esthetic philosophy of his time and assumed that art consists in conveying a sensation, not in persuading us to accept a truth. He was far nearer to pure estheticism than was Constable. Constable chose his subjects with a sense of their moral grandeur and worked over them to make them nobler and more dramatic. Corot had no such Protestant preoccupation with morals but was confident that, if he submitted with sincere humility to his sensations, *le bon Dieu* would do the rest. The point that unites them is unquestioning belief in the natural vision as the basis of art. By the mid-19th century this belief had evidently become widespread, and it found a born popularizer in the person of Courbet. For him, "Le beau est dans la nature, et s'y rencontre dans la réalité sous les formes les plus diverses." Beauty is there awaiting discovery by the artist, who has no right to amplify what he finds. "Le beau donné par la nature est supérieur à toutes les conventions de l'artiste." Although these statements have become the stock-in-trade of art teaching, in Courbet's day it was still postulated in academic circles that nature must be improved in the interest of the ideal. To paint merely what one saw was "vulgar." The widespread use of this word shows that the conflict between realism and academism, like most conflicts in the 19th century, has a social basis. Realist painting was called "the painting of democrats, of those who don't change their linen," and the provocative personality of a Courbet, tough and arrogant, was necessary to establish the new style.

Courbet's answer to rejection by the official Salon was his monster one-man show of 1855. It contained 14 landscapes, the earliest of which was dated 1841. These were truly popular paintings. One does not sense behind them, as with Constable, the study of landscape tradition; still less does one feel the admiration for Claude with which Corot gives a classic accent even to his Second Empire reveries. Courbet chose subjects with an immediate appeal and dwelt on them with relish; the grass is very green — greener than it has ever been in good painting before or since, the sunset skies are very pink, the sea is very blue. At their best Courbet's landscapes are great painting, not only because his skill and productive power are exhilarating, but because the wave of faith in nature is still at its crest. In them is witnessed the creation of a popular imagery that was to serve for almost a hundred years. When Courbet is true to his declared aims and does not aggrandize the expression, as in some of his smaller snow scenes, he remains a great landscape painter. But sometimes he is seduced by nature's more extravagant effects, occasions when only understatement could carry conviction; and sometimes, as in the embarrassing series of dying stags in the snow, he entirely forgets his principles in satisfaction at having produced an emotional effect. Such pictures are inescapably "vulgar," and it must be asked what, in relation to landscape, this word means. All forms of expression have within them the seeds of their own destruction, and just as classicism tends to emptiness and lack of vitality, so naturalism tends to vulgarity. It is the popular style, the style that can be understood without effort or education. Any art of recognition spares the effort of concentrating on formal relationships; but quite soon, recognition itself becomes an effort, and the popular taste demands ready-made equivalents for its favorite themes. In general, the popular landscapes are those in which the lazy or uninterested eye is suddenly jerked into responsiveness by an usually resonant contrast of tone or color. It is extremely difficult for a naturalistic painter to make true works of art from such crude effects, and to an artist with a less robust appetite than Courbet, seeking the popular effect is exceedingly dangerous.

To realize how such ready-made naturalism corrupts the eye, one has only to consider the early history of the impressionists (see IMPRESSIONISM). Until 1869 they were simple naturalistic painters: Sisley and Pissarro were devoted followers of Corot; and Monet was inspired by Daubigny, though he had first of all felt the more refreshing influence of Boudin. A glance at the early work of these fine artists makes it seem inconceivable that they should have been thought offensive. Bourgeois taste was already so debauched by pseudo naturalism, however, that the fresh vision of a Monet or Pissarro was an unpleasant shock. How far were the freshness and the shock due to the fact that these painters worked in the open air? On this point opinion has fluctuated. At one time it was usual to attribute great advantages to the method; but in truth, when an artist has evolved a consistent personal style, it is difficult to know when he has painted directly from nature. It was a mode of vision, not the physical fact of being out of doors, that made the impressionist scale of tones seem so startling.

Monet, Sisley (PL. 24), and Pissarro, during the 1860s and even as late as 1874, achieved the most complete naturalism that has ever been made into art. A picture could scarcely be much truer to a visual impression, with all its implications of light and tone, than the Sisley paintings of Hampton Court, or Pissarro's of Norwood. This perfect moment of impressionism, like all other points of balance in the history of art, could not be maintained for long. After about ten years the impressionists, like Constable fifty years before them, reached the crisis of the natural vision, the point at which it either relapses into the commonplace or ceases to satisfy the creative needs of the artist. To go on producing clear, objective transcripts of natural appearance without loss of freshness requires rare gifts of simpleheartedness and calm; and no artist of the first rank, except Corot, has succeeded in doing so. Even such an admirably endowed painter as Sisley suffered a gradual decline in sensibility and conviction. Monet and Pissarro, being more conscious of their dilemma, took a different course. They forced themselves to see in nature what the average eye cannot see, the web of pure color of which light is composed. Theoretically they were maintaining the principle of naturalism or even carrying it a stage further, but actually they were rejecting the limitations of the natural vision in favor of a transposition that would allow them greater creative freedom.

In 1870 the Franco-Prussian War temporarily broke up the partnership of the impressionist painters. Monet, Pissarro, and Sisley took refuge in England, where they painted their most completely "natural" pictures. This exile is mere coincidence; the war and the Paris Commune coincided with the naturalistic stage of their development, and England, as Monet afterward realized, is the setting for romantic rather than realistic painting. They do not seem to have been interested in Constable, whose work was then disregarded and whose sketches were not yet accessible. It is known from Pissarro's letters that they were impressed by Turner, though they saw only his big machines. When Monet returned to France in 1871 and once more began painting with Renoir, his palette grew more brilliant; but so did that of Renoir. A comparison of the pictures they painted together at Argenteuil shows that Monet still renders sparkle by contrasts of light and dark, whereas Renoir dissolves the

whole scene in broken touches of pure color, and in consequence loses some of the certainty of tone in which Monet excelled. In the pictures of Argenteuil by Monet and Renoir, done between 1871 and 1874, the painting of sensation yielded its most perfect fruits. These show an unquestioning joy in the visible world, as well as an unquestioning belief that the new technique alone can convey it. The balance between subject, vision, and technique was so complete that it not only captivated such sympathetic spirits as Sisley and Pissarro but even imposed itself on painters to whom it was quite alien. Manet, for example, whose own range of responsiveness to tone and color was similar to that of Goya — or even darker — was bewitched into trying his hand at an Argenteuil picture. Even Gauguin and Van Gogh, who were to destroy impressionism, painted some of their most beautiful pictures in this style.

By the middle of the 1880s the great moment of impressionism had passed. At first Renoir and Monet tried to keep up their excitement by choosing more and more brilliant subjects. Renoir painted flower-laden gardens, which gave the added problem of bright local colors, and Monet painted coast scenes that have the most intense light which can be put on canvas. Monet later moved to the French Riviera, where, in the garish sunshine of that hitherto unpaintable region, not only his forms but his color tones were dissolved in incandescence. It was the crisis of "sensational" painting, and each member of the group responded in a different manner. Renoir, with his fundamentally classical outlook, was inspired by the antique painting in Naples and by Raphael's frescoes in the Vatican to recapture the firm outline, and thereafter he gave up naturalistic landscape painting entirely. Pissarro, who had always taken more interest than the others in the architectural composition of his pictures, joined the return to order. Sisley, the least intellectual and self-critical of the group, went on painting in the same way with declining confidence. His last pictures are a warning that simple perception of nature is not enough.

It was Monet, the real inventor of impressionism, who alone had the courage to push its doctrines on to their conclusion. Not content with the sparkle of his Riviera scenes, he undertook to prove that the object painted was of no importance, that the sensation of light was the only true subject. Actually, Monet's technique made him particularly dependent on the nature of his subjects; and these were limited. Only sun on water and sun on snow could give full play to the prismatic vision and the sparkling touch. In such pictures Monet has remained without equal. In order to prove his point he chose for the subjects of his experiments cathedrals and haystacks. No doubt he did so intentionally, in order to show that the most articulate works of man and the most formless were pictorially of equal importance to the painter of light. But the choice, especially that of cathedrals, was perverse, because gray Gothic façades do not sparkle. In these muffled, obstinate pictures impressionism departed altogether from the natural vision from which it sprang. The arbitrary color of the cathedrals — now pink, now mauve, now orange — is less beautiful than the truly perceived color of the Argenteuil pictures; and the dialectical basis on which these subjects were painted prevented Monet from abandoning himself to such poetic fantasies or musical harmonies of color as Turner's *Interior at Petworth* (London, Tate Gall.).

Looking back over the years from the beginning of impressionism, one may feel that this unqualified confidence in the physical world was a fundamental weakness. Art is concerned with our whole being — our knowledge, our memories, our associations. To confine painting to purely visual sensations is to touch only the surface of our spirits. Perhaps in the end the idealist doctrine is right: we are more impressed by concepts than by sensations, as any child's drawing will show. The supreme creation of art is the compelling image. An image is a "thing," and impressionism aimed at abolishing things. In painting, the simplest and most enduring images are things with lines around them; and impressionism abolished line.

This is only a way of saying in pictorial terms that impressionism did not address itself to the imagination. One cannot call it the art of materialism, for that word carries too gross an implication; nor can one (as many critics have done) call it pagan, for paganism involves the idea of remote country superstition, spring festivals, and Dionysiac rites. Paganism has precisely that element of magic which impressionism excludes. That is the price one must pay for the happiness of here and now, on which it is founded.

From Turner to the present. The splendid procession of naturalistic painters that passes through the 19th century from Constable to Pissarro may lead one to believe that for a hundred years landscape painting took no other form. In reality, however, two artists of genius — Turner at the beginning of the century and Van Gogh at the end — show that the landscape of fantasy was still a valid and potent means of expression. Both were fundamentally northern artists; yet both were inspired by the landscape of Mediterranean countries, because only in these could they find that delirium of light which was the release of their emotions. It is through this passion for light that the landscape of fantasy is linked with the history of 19th-century painting. The great imaginative painters of the early 16th century had made effects of flame and sunset the chief weapons in their assault on our emotions and, with great powers of observation and memory, had rendered effects of light that could never have been achieved by a purely factual approach. So it is not surprising that, in the pursuit of light which was to culminate in impressionism, it was a master of imaginative landscape — a romantic and not a realist — who made the decisive step. It was Turner who raised the whole key of color, so that his pictures not only represented light but were also symbolic of its nature. Among his many achievements, this is the one that associates him with the great painters who succeeded him.

Turner had been painting supposed views of Italy for about twenty years before he visited that country in 1819, but these had all been copies from the drawings of J. R. Cozens or pastiches based on Claude. When he saw Italy with his own eyes, he might have said, as did Ingres when he went to Rome, "Comme ils m'ont trompé!" As if in reaction against the formal, twilight vision of his predecessors, he was conscious chiefly of the heat, glitter, and profusion. He made a large number of detailed drawings and water colors in which he was content to record his pleasure in the classic landscape with almost the simplicity of Corot. But when he returned to England and began to re-create his impressions in his studio, the memories of Italy were like fumes of wine to his mind, and the landscape seemed to swim before his eyes in a sea of light. Shadows became scarlet and yellow, distances mother-of-pearl, and the trees lapis lazuli; and figures floated in the heat-engendered haze, like diaphanous tropical fish.

Turner's visit to Italy also had the paradoxical effect of intensifying the anticlassical element in his art. From then on, he did not attempt sham Claudes and Poussins, and his compositions gave up all pretense of classical construction. Based on an extension of the mannerist scheme, rather similar to that evolved by Bruegel, they often involve serpentine recession along an inner and outer circle. They are also anticlassical in their staffage: monks, maidens, troubadours, balconies, guitars, and other properties of the "keepsake style," reminding one that the antique landscape of Corot was also the Italy of *Childe Harold's Pilgrimage*. For this reason Turner was happiest not in the classic locales of Naples and the campagna but in the wholly romantic setting of Venice, which effected the final release of his imagination. It was the confirmation of all the sunset-cloud architecture he had ever built in his mind's eye, and in consequence he could paint it directly, without the rhetoric with which he felt bound to embellish less dreamlike subjects.

The theory of color had long occupied Turner's mind; his annotated copy of Goethe's treatise on color exists, and his sketchbooks are full of completely abstract color combinations in which he put his ideas to the test. In his late paintings the transitions of color are as considered and elaborate as the transitions of form in a Poussin and, like them, represent an alliance of thought, sensibility, and imagination. Whereas

Poussin's compositions of form were conceived with a high sense of literature, and were in fact subservient to some literary or didactic intention, Turner's compositions of color existed for their own sake. Turner was completely devoid of literary sense, and his exhibition pictures are always weakened by their ostensible subject. In spite of this, one can feel the immense symbolic and expressive importance of color for his imagination; and when the human and historical elements were removed, Turner could distill from light and color a poetry as delicate as that of Shelley. Such are the pale opalescent visions of rivers and estuaries, of which perhaps the most beautiful are those which take their point of departure from Norham Castle. To say that they "represent" Norham Castle is as misleading as to say that a picture by Braque represents a woman at a piano. The logical connection between what we should have seen if we had been there and the faint touches of pink, blue, and yellow with which Turner has stained his canvas does exist: it is the essence of their beauty, but it is extremely complex and could be discovered only by reliving Turner's experience. And it is inseparable from the technique by which he floats onto the canvas the most delicate films and mists of color, a technique which Turner by elaborate precautions kept a secret in his own day, and which has remained a secret ever since.

These landscapes are almost as abstract coloristically as a great piece of classic architecture is abstract formally; yet they give a more vivid feeling of nature than do his earlier works, in which the shapes and colors of nature are so minutely described. Just as the grammar of language always defeated Turner when he wrote, so the articulation of style seems to have hindered that pure synthesis which his later paintings achieve. In the vast range of his work Turner fulfills practically every aim that the earlier romantics foreshadowed. He was penetrated by a sense of nature's unsubduable, destructive force and of man's impotence before it. He painted those elements of nature which supported this conviction, which were in fact the same as those which had expressed the romantic fears of the 16th century — the crags and tempests and "fire in the flood." It is Turner's devotion to this last motif which shows decisively his kinship with Grünewald, Altdorfer, and Bosch.

With the death of Turner it must have seemed that the romantic response to nature, the obsessive fears and the sudden glory, had vanished from landscape painting and could not reappear in a material world. But when, at the end of the century, the tide of naturalism began to turn, there emerged an artist who embodied all the impulses of Grünewald, Altdorfer, and Huber. Van Gogh was truly such a northern artist. Throughout his work there runs a restless flowing line, curling and uncurling in endless agitated spirals, as it does in the earliest ornament of the migrations period or in the convoluted draperies of German Gothic (PL. 25). This linear character is best seen in astonishing landscape drawings, where Van Gogh uses the style of Altdorfer and Huber with added truth and richness. One is dazzled by the color and saturation of light he is able to convey by a sort of hailstorm of dots and dashes. The particular recurrent images found in Van Gogh are the enormous suns, the gnarled and hollow trees, and the pierced and twisted rocks. Since he was oblivious of earlier expressionists and drew his inspiration from such utterly unlike sources as Millet and Hiroshige, it may be assumed that these images are really part of the permanent furniture of the unconscious. Above all, like Turner, Van Gogh had the northern sense of light as a source of magic; yet Van Gogh's light is very different from the pearly radiance of Turner. It is fierce, fitful, and distracting (once more one sees the analogy between light and love); it beats upon the brain and can be exorcised only by the most violent symbols — wheels and whorls of fire — and by the brightest, crudest colors that can be squeezed with frenzied urgency from the tube.

Thus, in spite of his passion for nature, Van Gogh was forced more and more to twist what he saw into an expression of his own despair. It was Van Gogh who brought the sense of tragedy back into modern art; and like Nietzsche and Ruskin, he found in madness the only escape from the materialism of the 19th century. Cézanne, when shown one of Van Gogh's pictures, said with characteristic brusqueness, "Sincèrement, vous faites une peinture de fou"; and looking at *The Road with Cypresses* or *The Ravine* (both Otterlo, Rijksmus. Kröller-Müller), one must reluctantly agree with him. Expressionist art involves a dangerous tension of the spirit. One feels that Grünewald cannot have been entirely sane; but the frenzied writhings, the Catherine-wheel convolutions of Van Gogh are further out of control than anything in El Greco and are in fact painfully similar to the paintings of actual madmen.

Impressionism, like all genuine art forms, created its own order by consistency of vision and texture, but it was the unity of sensation deriving from the glance or snapshot. The measured interplay of horizontals and verticals; the use of a house, a window, or a block of masonry as a modulus of proportion; the diagonal that turns back on itself after two-thirds of its journey; and the arc whose ideated center is a nodal point in the composition — all these devices brought to perfection by Poussin were foreign to the impressionists and may have seemed irreconcilable with their technique. As a result, they could achieve neither the scale nor the air of permanence of their greatest predecessors.

An exception must be made in the case of Pissarro. As the pupil of Corot he had learned the laws of classic landscape painting, and these are apparent in the village scenes he painted before 1870. They are even perceptible in purely impressionist pictures of the early 1870s, and it is not surprising that, when the group split up, Pissarro should have become an imitator of Seurat. Monet, on the other hand, was the pupil of two painters to whom the rules of construction meant little: Daubigny and Boudin. And it was Monet whose desire for total immersion in a bath of appearance led him to leave the firm ground of traditional design. Not that his compositions were feeble, but they tended to be loose and hearty, and by the 1880s this bent occasionally degenerated into sloppiness.

This is the point at which Seurat appeared, concentrating in himself all the intellectual currents of the time: the belief in science, the interest in primitive and Oriental art, and even the beginnings of Art Nouveau. He and Cézanne represent the two prime traditions in 19th-century French painting. Delacroix was Cézanne's god, whereas Seurat's earliest paintings are wonderfully perceptive copies of Ingres. After these classical exercises of Seurat, there occurred a gap in his career while he completed his military service. Stationed at Brest, he spent the long hours of sentry duty gazing at the sea and gained the intimate knowledge of its light and color that was the basis of his finest landscapes. The landscapes Seurat did on his return to Paris show without question that he was influenced by the tonality of impressionism, and in particular that of Pissarro. They also show that he was a man of delicate poetic sensibility coupled with the French passion for intellectual tidiness. He must have studied the Uccello battle scene in the Louvre (XI, PL. 43), feeling some instinctive sympathy with this earlier disciple of theory, and he took from Uccello the idea of arranging simple masses of light and dark so that one is always set off by, or even framed in, the other. This involved reducing the modeling of his figures to a minimum and placing them in profile, so that they did not upset the stability of the design by moving from one plane to another. But these simplified elements were subject to the most complex laws of composition. Seurat was a great master of the mathematical laws of harmony by which all the greatest architects of the past, and some of the greatest painters, have secured their effects. The arsenal of geometry, of which the golden section was only one important weapon, was at Seurat's command, and perhaps no painter other than Poussin and Piero della Francesca has used it with greater precision.

Seurat's finest work, nonetheless, depends on his emotional response to what he has seen. He was particularly moved by the seaside, by the immense whiteness of water and sky, by the precision of seaside architecture, and by the interval of proportion between sky and jetty, or sea and distant sail (PL. 24). That space should be both uneventful yet full of movement, architectural yet tremulous with light, was the first necessity of his spirit, as can be seen from his simplest drawings. In these

seascapes Seurat has taken the archetypal impressionist subject — sailboats on sparkling water — and has used it for anti-impressionist ends, plotting every inch of surface with the industry of a coral insect and the logic of a mathematician. Seurat's ambitions were very great. He wished not only to tidy up impressionism but to employ its luminous technique and contemporary vision in the creation of pictures that had the scale and timelessness of Renaissance frescoes. This aim involved great difficulties of style, of scale, and of vision, but Seurat succeeded at the first attempt. The *Bathers* (VII, PLS. 436, 437) remains a triumph of the will, and one of those great works which immediately convince us of their authority, from which each succeeding age will draw its own conclusions.

The *Bathers* is painted in an extension of the impressionist technique, which Seurat called *balayé*, meaning that touches of pure color were swept on by a broad brush. But as the requirements of Seurat's sense of design became more exacting, he felt that the touches, in order to be more easily controlled, must be smaller. This belief coincided with the crystallization in his mind of a pseudoscientific theory of color, which was applied in his next great picture, *La Grande Jatte*, together with all the other principles of composition that went into the *Bathers*. Here the preliminary studies were even more numerous and elaborate than those for the earlier picture, for in addition to drawings and small color sketches he made a number of large preparatory paintings (IV, PL. 280; V, PL. 115).

Without comparing the two men as painters, there is no doubt that Cézanne possessed the richer and more abundant temperament. Painters with disparate aims can find in him inspiration and support for their own endeavors, and as a result he has often been considered in his several aspects — which is exactly how he should not be considered. One runs the risk of doing this by treating Cézanne landscapes as a part of a return to order; to correct the balance, one should first recall the sumptuous, thundery picnics and bathing parties, of which the Pellerin Collection in Paris has several examples. These Baudelairean orgies show that Cézanne's genius was based on a colossal sensuality. They essay the only style in which an exuberant young romantic could express such violent emotions, the style of Delacroix. But Cézanne's peculiar limitations as an artist, his inability to paint from memory or to use the stylistic tricks of other painters, led to a complete travesty of his model. In particular, he was quite incapable of using the traditional devices by which postbaroque artists had achieved the illusion of depth. In the Pellerin *Bathers*, serpentine recessions have been rolled flat. Yet his power to reduce what he sees to interesting shapes is already very impressive, and one sees how he felt that a picture must exist as a design of flat patterns even before it creates an illusion of depth.

Cézanne's earliest important landscape, *The Cutting* (Munich, Neue Staatsgalerie), gives a clear idea of his strength and weakness at this time. Compared with Seurat's exquisitely neat and lucid compositions, it is very crude; but it has stunning boldness and a largeness of vision. It also foreshadows one of the chief characteristics separating Cézanne from the impressionists: the frontality of his attack. The powerful horizontals running parallel to the picture plane and supporting the simplified mass produce an immediate assault on the eye, differing both from the carefully contrived "lead in" of the baroque landscape and from the balanced design of the classical. In another landscape done at this period, *Les Quais de Bercy* (Paris, Coll. Lecomte), Cézanne subdues his imagination in the interest of facts — a process that was to occupy him during the next twenty years.

Although he was friendly with the impressionist group and interested in their coloristic experiments, Cézanne was troubled by the changeable conditions of open air. Much of his time was spent in the Louvre making copies of Rubens and Delacroix, as well as the innumerable pencil studies of antique and baroque sculpture presumably unknown to those critics who have maintained he could not draw. These studies show a progressive mastery in realizing form without sacrificing flat pattern, but Cézanne had not yet found a means of carrying this over to his painting. He recognized that he could not express his grand conception of the world through imagery half-invented, half-remembered from the old masters; he could do so only by setting down with complete truth the visual sensations conveyed to him by natural objects. The technique of his friends the impressionists offered him a means of registering every shade of visual sensation, but for a time Cézanne thought they were too much concerned with the surface of things. Such a judgment could not survive acquaintance with Pissarro's sober and thoughtful work, which even as late as 1872 retained the elements of classical composition. Moreover, Pissarro, the oldest of the group, had lulled Cézanne's suspicions by the understanding he had shown of his crude beginnings; and in 1873 Cézanne was persuaded to join Pissarro at Auvers. The humble spirit in which Cézanne attempted to learn the impressionist style is shown by the fact that he made a careful copy of a Pissarro in which the composition is contrary to his usual practice. He has followed Pissarro's scheme of perspective, with the road running diagonally into the background. This was the conventional scheme of landscape composition taught in schools, but it was foreign to Cézanne's direct and frontal approach to nature — how foreign can be seen by comparing it with an authentic Cézanne composition of almost the same date, the landscape *Chestnut Trees at the Jas de Bouffan* (Minneapolis, Inst. of Arts). The lines of the foreground run parallel to the picture plane, and the composition is broken almost in the middle by a strong vertical line; yet Cézanne achieves an effect of depth by perfect understanding of color value.

As with anyone learning a new style, Cézanne's first impressionist pictures are less satisfactory than those which immediately preceded them, but quite soon he was able to adapt the new language to his own purpose. In *The Enclosure Wall* (New York, Coll. Durand-Ruel) he uses a broken touch to give the vibration of light, but the architectural composition might belong to his work of any period. It is the beginning of the famous attempt to "do Poussin over again from nature," and in fact it is by no means dissimilar from a Poussin composition in its balance of verticals against a parallel horizon and in its use of distant architecture as a nucleus. It is, however, less closely knit in design than his subsequent landscapes, and much less closely painted. Ten years later a rough statement like the foliage of the overhanging branch would not have been allowed to stand; and although the sense of light in the background is vividly rendered, Cézanne is not yet able to give every inch of his canvas a beautiful and vivid texture.

This aim he achieved through a struggle to integrate his natural sense of flat pattern with his consciousness of solid form, a struggle so fiercely sustained that it gives a feeling of tension to every part of his pictures. As a result the objects depicted — no less than the brush strokes — begin to take on some dominating shape, like trees on the coast that have all bent before the same relentless wind, or rocks twisted into a unity of rhythm by the same seismic upheaval. Such unifying distortions are common to all art, but they are usually concealed; whereas in Cézanne's work they are presented with the uncompromising directness of all his utterances. Critics have not agreed how far such distortions were calculated, how far instinctive, and perhaps the question is unanswerable. All art involves selection and control of natural appearances, which must reflect the artist's whole temperament, and in the choice of his dominant forms Cézanne was simply expressing his own vision of nature. But in the use of these forms he was, no doubt, perfectly conscious of his intentions. For this strange man, whose views on life seem to have been simple and orthodox to the point of absurdity, was where art was concerned a profound and original thinker; and even in this period of prevailing naturalism he had the insight to define painting as a harmony parallel with nature.

It is easiest to apprehend Cézanne's principles of design, as he himself learned them, from his paintings of still life. Very soon, however, he was able to transfer them to the more complex and evasive subject of landscape. As his design becomes more intellectual, his compositions are built up on straight lines rather than curves. But these straight lines — for example,

in the trunks of trees — are frequently interrupted. It is as if Cézanne put them up as a scaffolding but then feared that they would arrest the movement of the picture and lead to a too great insistence on contours. He recognized that an uninterrupted line implies a point of focus on the edge of the object and so makes impossible any movement in space, forward or backward, and even in his first pencil notes he always interrupts an outline and starts it again a fraction farther in or out.

Cézanne's interest in the problems of construction is seen most clearly in those landscapes of Provence in which he gave the scenery of his native country the eternal harmonies of classical landscape. But this triumph of vision is inseparable from a triumph of style. The landscapes of L'Estaque (III, PLS. 184, 190) and the farmhouses near Mt. Sainte-Victoire (III, PL. 191) show for the first time one direction that Cézanne's mature style was to take — the direction that after his death was to lead to cubism. The motives that prompted him to adopt this way of painting are quite simple and are latent in all his early work. He wished to render the solidity of objects without degrading his color or weakening his design by continuous modeling. The only means of doing this was to split his planes into many small facets, each of which could, by its color, make one aware of a new direction of the planes. This cubist, or perhaps prismatic, approach to individual forms was also inherent in his compositions as a whole. It is this attitude which distinguishes him from the impressionists, for impressionism also offers a means of rendering continuous modeling by color, a means developed by Seurat. But underlying all impressionism is the belief that the unity of a picture depends on the enveloping atmosphere rendered by a continuous weft of color; whereas Cézanne wished forms to retain their identity and cohere in an architectural relationship. To achieve this, he began by choosing subjects in which the forms went some way to meet this kind of simplification.

In 1895 the art dealer Vollard, on Pissarro's advice, arranged for the first time a comprehensive exhibition of Cézanne's work, and immediately the great French painters of the day recognized Cézanne as their master. Monet, Renoir, Degas, and Pissarro himself spent what little money they could afford in buying his pictures. Nevertheless, the fame for which Cézanne had striven so vigorously in his youth came too late to give him pleasure. He had aged prematurely and had become almost insanely suspicious of interference. The struggle to solve so many problems of painting and thereby express himself had cost him his friends and everything else life had to offer; and when he was almost in sight of realization of his goals, he became terrified lest some outside influence should deflect him. His inner life at this time was evidently of great turbulence, and his state of mind expressed itself in agitated, cursive handling very similar to that of his earliest work, in complete contrast to the delicacy and precision of his middle period. This turmoil is evident in his water colors and is intensified in his oils, where the paint is applied with disturbing ferocity. His concentration involved a narrow choice of subjects. His landscapes were virtually confined to the quarry of Bibémus, a motif that seems to have provoked the greatest violence; a building known as the Château Noir, which he used as a studio; and Mt. Sainte-Victoire. Of the mountain he made innumerable studies, and one feels that the painting of this motif became for him like a ritual act of worship, in which he could achieve perfect self-realization.

In one of his letters, Cézanne writes that he believes these late works, if exhibited, "will give a correct notion of progress of my studies"; and anyone who understands his intentions will agree with him. It is more surprising to realize that these are the works in which he believed himself to have the clearest understanding of nature. "Je deviens comme peintre," he writes in 1906, "plus lucide devant la nature." By this he surely meant that his own passionate imaginative life, which as a young man he had tried to express by creating fantastic images, could now be revealed in every stroke with which he recorded his visual sensations. He had brought his inner and outer vision into uniform focus and had created a harmony parallel with nature. The unifying factor was his own temperament; but this could exert itself only unconsciously on the raw material of things seen, experienced as shape and color and wrestled with to secure their maximum realization. In so far as modern art involves a readiness to override nature, to defy appearances in the interests of emotion, Cézanne was far from being a modern, for no one ever looked at nature more earnestly. In this pursuit he was at one with the great landscape painters of the past, with Bellini, Rubens, and Poussin; and it is with them that he belongs.

Kenneth CLARK

For a discussion of landscape painting in the Americas, see I, cols. 280, 285, 287 ff., 305, 344.

THE EAST. *India and Southeast Asia.* The character of landscape art in India has been determined by the topography of the country: an immense plain rising gradually from sea level to a highland, occasionally interrupted by low ranges of hills and broken with ravines near the large rivers. The most salient features are the innumerable shallow ponds and lakes; whether natural depressions — dammed wherever possible — or man-made excavations, these are covered with water lilies and lotus and swarm with geese, ducks, herons, and other aquatic birds. The dams, a favorite resort of the people, are surrounded with bathing ghats, pavilions, temples, country houses, and luxuriant gardens irrigated by channels from the lake. These waters and landscaped embankments are cool retreats in a tropical climate where the distance is veiled by waves of heat. Neither the mountains of central and southern India, long inhabited by primitive tribes, nor the higher ranges of the Himalaya, visited only by Hindu pilgrims who frequently have renounced the world, have contributed significantly to the inspiration of Indian landscape art. Although their snow-covered peaks occasionally figure in the Rajput miniatures of the Pahari school (18th–19th cent.), these paintings ordinarily depict their more accessible surroundings — the river valleys, lakes, and undulating hills of the outer Himalaya.

Thus it is typical of landscape in Indian art (q.v.) that it is for the most part without broad vistas; instead there are generally found painstaking reproductions of details of the immediate environment. Within this prevailing tendency, however, wide variations in approach are to be noted, for although scenery was in some periods reduced to summary indications of trees or houses, in others one may find attempts to encompass perhaps several miles of landscape.

The oldest fragments of crude paintings on shards of the Indus, or Harappa, civilization (3d–2d millenium B.C.; see INDUS VALLEY ART) present just a few hints of vegetation, along river banks where deer are grazing. Early Buddhist art, on the other hand, aspired to a more comprehensive treatment of the natural environment. In the reliefs from Bharhut (VII, PL. 442), scenery continues to be artificially disposed: the over-all ground plan is rendered from a bird's-eye view, while the individual elements are viewed from the side. The 1st-century B.C. reliefs from the cave monasteries of Bhaja (near Bombay) and Udayagiri (near Orissa) depict real landscapes based on empirical — though naïve — observation. The components are many and diverse: sacred trees protected by railings and hung with votive gifts, lotus-banked ponds and rivers with bathing elephants, various tame animals, the rude huts of ascetics, and men and women playing musical instruments, dancing, or courting. The land appears to slope upward from foreground to background, perhaps a visual convention, since the setting is probably meant to be a plain. Where mountains appear, they are oddly stylized and resemble grotesque cliffs, a strange conformation actually found in many parts of India. The abundant caves of these mountains attracted both pious ascetics and amorous couples during the torrid season. In the gateway reliefs of a stupa at Sanchi (2d–1st cent. B.C.; VII, PL. 441) the landscape, though it has become a more elaborate and balanced backdrop, has retained its naïve charm and its detailed observation of nature. The stupa reliefs (2d–early 3d cent.) of the Śātavāhana and Ikṣvāku dynasties, from the Andhra littoral, reveal an almost illusionistic, yet empirical

perspective. In these, because the culture had become predominantly an urban one, the subjects in turn become episodes in the life of cities and sizable villages, as well as at pilgrimage spots, and the open countryside is but rarely depicted.

In the provincial Hellenistic art of Gandhara (1st–5th cent.; q.v.), along the Indo-Afghan frontier, landscape is rarely depicted, being confined largely to representations of the Buddha sitting in a mountain cave; overhead are grouped bodhisattvas, monks, lay followers, and various animals. Unlike earlier art of the country, this recurrent compositional scheme has almost no peculiarly Indian features; rather, it belongs to the Alexandrian tradition.

In the decoration of the Hindu temple, from the Gupta period (4th cent.; see GUPTA, SCHOOL OF) through medieval times (13th cent.; in the south, 16th–17th cent.), landscape backgrounds or motifs are virtually nonexistent. Figures of gods, heavenly nymphs, men, and animals are ranged in essentially flat friezes about the walls of both freestanding and cave temples. Individual figures may have pronounced depth, or the conventional overlapping of groups of figures may create a suggestion of depth; but there is no systematic attempt to achieve the effect of a truly spatial setting. Even where some indication of setting is indispensable to the purpose, such elements are reduced to a minimum: a bed, a portal, a diminutive palace, a tree, or some rocks. During this era it is only in the cave temples of Ellora and, to some degree, in those of Elephanta (6th–8th cent.) that a little more in the way of setting is presented: a mountain scene, with Śiva and Pārvatī surrounded by gods and demons; a lotus pond spreading at the feet of Lakṣmī; a lake from which rises the stem of a huge lotus held by *nāgarājas* (snake kings), whereon the Buddha or Śiva as Lakuliśa is seated in the yoga posture. The most ambitious landscape, the representation of Mount Kailasa, occurs in the episodes where Śiva, merely by pressing down with his toe, subdues the rebellious demon king Rāvaṇa, imprisoned and quaking within the mountain throne of the gods. This scene, well known from the large group in the Kailāsanātha at Ellora (IV, PL. 171), recurs as the sole landscape motif on the walls of many freestanding temples, especially in southern India. This mountain, essential to the narrative but stylized almost to a thronelike conformation, is often represented in various tiers filled with animals, gods, and godlings.

The murals at Bagh, Ajanta (q.v.; PL. 6), and similar sites prove that such restrictive use of landscape can be attributed to purely religious considerations implicit in the magic symbolism of the Hindu temple. In these frescoes, which reflect the character of the lost secular paintings of the time, the landscape of earlier Buddhist art persists, though in a very refined guise. Scenes are of minimal depth and include streets, views into houses, gardens, and pavilions, sometimes disposed over a slope with geometrically stylized cliffs but with admirably lifelike plants, animals, and richly dressed people as well.

Hindu art in Indonesia and Indochina was less inhibited in this respect. Delicate descriptions of nature occur at Borobudur and Prambanam (9th–10th cent.), but once more it is the immediate milieu that is reproduced: forests populated with monkeys and birds and all varieties of tame and wild animals, lotus ponds, villages, palaces, and views of the sea with sailing ships. In Eastern Javanese and Balinese art, when the indigenous Malay sentiment came to the fore again, landscape motifs became increasingly important. There were attempts at depicting an extended landscape, even with a primitive perspective, incorporating palaces and water pavilions, rivers and mountains, temples on slopes, and bridges. Some, such as the reliefs of the central temple of the Majapahit kingdom at Panataran, are rather clumsy; later representations are more naturalistic in appearance, for example, the relief from Travulan. Ultimately, in the art of Bali, landscape dissolved into a general background of ornamental rocks and leaves.

In Khmer art (q.v.) the all-pervasive primeval forest of Cambodia forms the background of many scenes, but in general it remains simply background — a mass of treetops emerging from behind mythological scenes, historical processions, and battle scenes. Its execution evidences careful observation of details, in the diverse trees, birds, deer, and beasts of prey. Perhaps the best of these landscapes are a *Rāmāyaṇa* scene at Banteay Srei (10th cent.) and a series of reliefs in the Bayon at Angkor Thom, with their descriptive treatment of a river (boats, fish, crocodiles, etc.) and the life along its shores. In the later art of Burma, Siam, and Cambodia, strong Chinese influences became particularly apparent in the landscapes.

In India proper, the advent of the Moslems introduced a new style of landscape art. Early Indo-Moslem painting — only few fragments of which have been brought to light — seems to have confined itself to spare indications of background, just as is found in contemporaneous Jain miniatures. Thereafter, the introduction of Timurid painting in the late 15th century, especially through the work of the Moghuls, brought with it the semi-Chinese landscape and its combination of bizarre cliff formations and naturalistic trees, flowers, and animals. This style of landscape was again seen with bird's-eye perspective as a whole, but individual details were rendered as if viewed from ground level. Often the artists also tried to compress all the landscape details into several compact groups establishing the foreground, middle ground, and background of the picture. Houses and towns were treated much like stage wings, resembling cardboard panels rather than substantial structures. This tendency to organize a composition in depth like a sequence of scenery panels became more pronounced after Moghul painting became Indianized during the 17th century (VII, PLS. 499, 500; see MOGHUL SCHOOL). The landscape was interpreted as if seen from atop a one- or two-storied house. The principal event — usually occurring on a terrace, meadow, or court — was set between a foreground consisting of flower beds, a seashore, or other elements and a dual background comprising first a garden, lake, pavilion, or gateway and then the outlines of trees and palaces, as well as a splendid post-monsoon sky of red and golden clouds. In the 18th century, partly because of acquaintance with European painting, there developed a convincing landscape setting. Especially in pictures of the school of Oudh (second half of 18th cent.), one finds broad vistas of enclosed gardens, towns, fields, lakes, rivers, and hills, frequently with caravans or armies moving across the scene. Erratic perspective is common in this late eclectic style, however, and is the result of combining several pictures into a single more comprehensive landscape, without properly adjusting the components to a consistent viewpoint. Only toward the end of the 18th century was uniform perspective achieved in such landscapes.

The early painting of the Rajput school (q.v.) does not evidence any spatially convincing landscape. The subjects were conceived quite two-dimensionally, and the scenery constituted merely a sort of flat backdrop. When scenic elements were taken over from Moghul painting, the figures were often apparently suspended in mid-air, without contact or relation with either ground or background. After Moghul painters emigrated to the Rajput courts in the second and third quarters of the 18th century, true landscape art developed; but in the Rajasthani branch of the school, the art of the plains, depiction of landscape remained rudimentary. In Pahari art, the Himalayan or hills branch of Rajput, however, especially in Kangra painting, scenery became a rather well-developed accessory. Here it was also quite carefully observed but tended toward an ornamental stylization.

Modern Indian landscape art has not yet developed a distinctive style. Artists working in an impressionistic technique treat the Indian scenery in the same way as European painters might; for those working in an expressionistic vein the problem of landscape is not a prime concern. Nonetheless, the relation and the emotional response of Indian artists to their native landscape differs noticeably from a Western attitude to the same milieu (see ORIENTAL MODERN MOVEMENTS). The Indian landscape is not for them a source of exoticism; it is an intimate environment saturated with the sentiments of a common, inherited religious and national tradition.

Hermann GOETZ

China. The profound veneration of the Chinese for the forces of nature is the base upon which their landscape art was formed (see CHINESE ART). Its principles are rooted in the con-

cept of Tao (see TAOISM) as expressed in *Tao-tê-ching* (Chap. XXV), wherein the Tao "is something without form, although complete, which existed before heaven and earth, without sound, without substance, dependent upon nothing, immutable, permeating all things, infallible . . . ." It was this formulation of the Tao as the supreme concept of spirit and matter which pervaded the creative imagination, subject, and interpretation in Chinese landscape art. Taoist philosophy profoundly influenced Chinese painters and taught them to lose themselves in the immensity of nature in order to find themselves once more, thereby identifying themselves with the spirit permeating the universe, which is the Tao.

The Tao is manifested in the eternal flow of being and becoming; it is never static. Forms appear and disappear in water, in clouds, and in the mists, and their rhythm palpitates in a perpetual becoming. It is in this unceasing movement that the Tao is manifest. "The Tao does not create, but there is nothing which is not created." This is the most subtle and fruitful aspect of the Tao in its relation to art, for it inspires the unique interior dynamism: this manifestation of activity in the midst of quiet was conveyed by Chinese artists in their reproduction of static forms, which generally arise from the resolution of the opposing principles yin and yang. The Chinese artist has been subject to this resolution of opposites in the ordering of his composition and in the creative process. Landscape art — which in Chinese is descriptively called *shan-shui* (mountains and water) — is none other than a representation of mountains and streams in which these opposites complete each other. Taoist mysticism and then Ch'an Buddhism (see BUDDHISM) were thus the principal intellectual and spiritual forces that raised landscape art to the heights attained in the Sung period (960–1279).

Aside from mountains and water, a third element, the tree, was indispensable to the representation of landscape. The tree most favored by Chinese artists was the pine: its straight trunk, with knotty and twisting branches, personified the wise man who, buffeted by the winds of calumny and misfortune, remained steadfast in his profound faith in the Confucian virtues. Also favored was the bamboo (to which an entire branch of painting is dedicated), the symbol of lasting friendship and of the *chu-jên* (gentleman) who bows before the tempest but rises again when it has subsided. The pine, the bamboo, and the plum — the herald of spring — were termed "the three friends of the cold season"; other varieties represented include the willow, the elm, the oak, and the mulberry. Rocks, flowers, and shrubs were further components of landscape art, and waterfalls and gorges were features chosen to evoke the awesome and more violent aspects of nature.

This exaltation of pure landscape is characteristic of Chinese painting (in contrast with Western painting, where landscape customarily furnishes a background for human activity), in which man is clearly subordinate to the immensity of nature. Particularly in the Sung and Ming periods, in the midst of his presentation of natural phenomena, the artist would depict a tiny hut with one or two sages lost in contemplation of the infinity and beauty of the landscape. In painting scenes of this type, the artist accepted in principle that he must identify himself with the landscape and become completely one with the Tao. He was concerned not with the outward appearance of nature but with its inner spirit; therefore he limited himself to the essential elements, since only within such strictures could he attain the universal spirit. Chinese literary-artistic sources repeatedly tell of great painters who spent months and even years in mountain regions, immersed in the spectacle of nature and searching for its essence. When they had achieved this mystical identification, they recaptured the vision and with their mastery of the brush immediately reproduced it without hesitation and without the preparatory sketches common to Western painting. Although the landscapes were often identified with a name, and certain subjects were depicted many times, this does not signify that the paintings were actual representations of particular scenes. Chinese artists rarely painted from life, but instead created ideal landscapes, expressions of a cultural ideal that dominated the production of the Chinese literati painters of the Sung and subsequent periods. Chinese artists did not attempt to depict landscape in realistic and detailed terms but gave more a unitary impression of the whole scene. Perhaps it is this ability to bring together many details in an expressive and unified entity, animated by the true spirit of nature, that distinguishes the masters of landscape from their many followers and imitators. Undoubtedly Hsieh Ho, the great 5th-century critic, had this in mind when he laid down the first and most important of the "Six Principles" of painting, the *ch'i-yün shêng-tung* (the consonance of the spirit and the dynamism of life); this principle represented the most profound concept of Chinese art. In other words, even the greatest inspiration was without value if the artist did not possess the ability to bring it to life; on the other hand, even the greatest technical proficiency was of little account if the artist lacked genuine inspiration.

There is some knowledge of the earliest landscapes of the Han period (206 B.C.–221 A.D.), when the principal compositional elements first appeared on textiles, carvings, mirrors, and objects of inlaid metal. Nature, however, was depicted in abstract and highly symbolic terms. The reason for this lies in the scant interest of the artists of this period in landscape painting; they preferred to concentrate on figural painting that depicted myths, legends, history, and stories of filial piety. Landscape painting in the true sense of the term did not come into being until the period of the Six Dynasties (A.D. 220–590). It was the great painter and calligrapher Ku K'ai-chih (q.v.; III, PL. 235) who first gave value to this art form, although in his work the proportions of the figures, too large in relation to the mountains, are not natural, and the mountains are so stylized as to be almost unrecognizable. Tsung Ping, a contemporary of Ku K'ai-chih, was reputed to be a famous landscape painter, but unfortunately none of his works have survived.

In the 4th century, landscape painting apparently underwent profound stylistic changes, but no authenticated originals of this period have survived; the only painting that could possibly be attributed to the 4th century is a mural in Cave 110 at Tun-huang (q.v.), on the western edge of China. The subject, a mountain landscape that is part of a Jātaka, is treated in a highly decorative manner, with the very stylized mountains placed one beside the other in rhythmic groups. The Tun-huang paintings, the work of provincial craftsmen, were but distant copies of the style in favor at the imperial court. In the 6th century, however, a true form of landscape art was developed: for the first time, figures were rendered more correctly in proportion with their natural setting, and composition began to convey a sense of space (III, PL. 244).

The T'ang period (618–906) saw landscape art emerge as an art form wholly independent of the human figure (q.v.), acquiring an importance equal to figure painting. This is the merit of two great artists, Li Ssŭ-hsün (q.v.) and his son Li Chao-tao, who were the first to use a technique known as *kung-pi*, characterized by a palette of blue and green malachite colors and gold, with delicate brushwork. Unfortunately no certain originals of these two artists exist, but two works of a later date, paintings on silk, are known to reflect their style: *Travelers in the Mountains in Spring* (formerly, Peking, Palace Coll.) and *The Chiu-ch'êng Summer Palace* (PL. 152). The meticulous painting, precision of detail, and the brilliance of the colors make them excellent examples of that style of painting of the T'ang period known as *ch'ing-lü shan-shui* ("blue-and-green" landscape). The dominant artistic figure of the 8th century was Wu Tao-tzŭ (q.v.), one of the pioneers in the evolution of landscape painting. Another famous artist of the period was Wang Wei (q.v.), who used the *p'o-mo* ("broken ink") technique. T'ang painting represented the natural elements of the landscape in a clearly defined manner, but the human figure nonetheless remained the focus of artistic interest during the period.

Substantial changes in landscape painting occurred in the 10th century, when the artists, differing from their predecessors of the T'ang period, created a type of landscape no longer subordinate to the human figure. The first of these artists was Ching Hao, active in the early 10th century, to whom two paint-

ings are attributed, a view of the K'uan-lu Mountains (formerly, Peking, Palace Coll.) and a scroll of landscapes (Washington, D.C., Freer Gall. of Art). A contemporary of Ching Hao was Kuan T'ung, to whom is attributed the scroll *Ford across the Mountain Stream* (formerly, Peking, Palace Coll.). His brush stroke is more spontaneous and the composition has a greater sense of depth and space, obtained by deft use of fog and aerial perspective. The major artistic figure of the mid-10th century was Li Ch'êng, whose painting *Travelers amid the Snowy Hills* exhibits a different treatment of the background and includes trees of bizarre and contorted forms. Another artist who influenced later generations was Tung Yüan, in whose hands landscape acquired effective depth by means of a balanced use of clouds among the mountains. Although he also worked in the monochrome style of Wang Wei and in the polychrome style of Li Ssŭ-hsün, he was chiefly famous for his use of Chinese ink.

The landscape art that flourished in the 11th century, during the period of the Northern Sung dynasty (III, PLS. 262, 269), was based on and continued the artistic development of the 10th cent. The most eminent painter was Kuo Hsi, whose fame rests on his activity both as a painter (PL. 26) and as the author of a famous treatise on landscape painting, the *Lin-ch'üan kao-chih* ("The Great Message of Forests and Streams"). His concepts of landscape, in relation to the artist who elaborates them and transmutes them into painting, arise from his profound comprehension of nature and its subtler aspects beyond external appearance. Another noted artist of the 11th century was Mi Fei (q.v.; or Mi Fu), whose reputation proceeds from his being a leading exponent of the Southern school. His style was carried on by his son Mi Yu-jên, who painted the scroll *Misty Mountains and River Landscape*, in which the mountains swathed in mist are placed within a composition that is extremely simple. Two renowned artists of the first half of the 12th century were Li T'ang and Chao Po-chü. The former is noted for his scenes of village life; the latter for his manner of painting with blues, brilliant greens, and white (*ch'ing-lü-pai*).

The Southern Sung period saw the rise, about the year 1200, of a school of monochrome painting that may be considered the highest point attained by Chinese landscape painters. The two great artists of this school were Ma Yüan and Hsia Kuei (qq.v.; III, PLS. 263, 265). In the work of Ma Yüan, mountains lost the structural clarity of the older masters and were depicted with a transparent outline that increased the spatial effect. In the last decades of the Sung dynasty (960–1279) a new school of landscape art, based on Ch'an Buddhism and its teachings, was founded. One of the famous Ch'an artists was Liang K'ai (q.v.), who adopted the "summary" manner (*chien-pi*) in which the brush strokes were reduced to a minimum. Another remarkable artist was the monk Ying Yü-chien, who with the *p'o-mo* technique handled the brush so freely that the ink often appears to have been sprayed on the paper. Another contemporaneous artist was the monk Mu-ch'i (q.v.), whose very simple landscapes are without unnecessary detail or ornament.

Under the Yüan dynasty (1260–1368), a radical stylistic change took place in Chinese landscape art. The interest of the artist turned exclusively upon the external appearance of the natural scene, landscape wholly without figures (III, PL. 276). The exponents of the Southern school regarded these artists as the ideal literati painters (*wên-jên-hua*). Belonging to no academy, they lived a free life dedicated entirely to art and assumed the title of *tao-jên* or *shan-jên*. The most eminent of these artists was Huang Kung-wang, who wandered through the mountains to observe the changing moods of nature. He often painted — contrary to Chinese tradition — at the actual scene. His *Mountains of Fu-ch'un* (formerly, Peking, Palace Coll.), is typical of his work, which emphasizes forms with areas of light and shade, to create a feeling of space and atmosphere. Another painter, much admired in the West, was Ni Tsan (q.v.), originator of the *kan-pi* ("dry brush") style, by means of which the artist, using very little ink, was able to produce extremely fine brush strokes. The last notable artist of the Yüan period was Kao K'o-kung, whose manner of painting differed greatly from that of his contemporaries, for his style was closer to the Sung tradition and modeled on the works of Mi Fei.

The advent of the Ming dynasty (1368–1644) saw a revival of the arts. The styles of painting once again underwent a change, and landscape art expressed a new set of ideals. Notwithstanding these changes, regard for tradition was maintained: the Ming artists claimed to follow the Sung and Yüan masters in the two schools of the period, the Wu and the Chê. A master of the Wu school and one of the great Ming painters was Shên Chou (III, PL. 283); the chief painter of the Chê school was Tai Chin, who followed the precepts of the Sung period. The two leading artists of the early 16th century were Wên Chêng-ming (q.v.; III, PLS., 282, 283) and T'ang Yin, according to Chinese tradition both followers of the Wu school. A pupil of T'ang Yin was Ch'iu Ying, who revived the *kung-pi* method, the so-called "blue-and-green" landscape. The works of these artists are marked by exquisite detail; the ink was applied with moderation, and brilliant touches of color emphasized the decorative design (III, PL. 287).

After the death of Wên Chêng-ming and Ch'iu Ying there was a noticeable decline in the art of landscape painting, which lasted until the mid-17th century. With the Ch'ing period (1644–1912) came new trends derived from the art of the T'ang, Sung, and Yüan eras. One of the best-known painters of the late 17th century was Wang Hui (see WANG SHIH-MIN, etc.), a gifted man but lacking in originality. Although painters of this tendency dominated the artistic scene, another group of artists appeared who created works of very different type. Termed the "Great Individualists," the majority of them were Taoist monks. The most famous of these was Tao-chi, better known as Shih-t'ao (PL. 27; III, PL. 292), whose pictorial style was both spontaneous and highly expressive. Another artist of this group was the monk Chu Ta, better known under the name of Pa-ta-shan-jên (q.v.; III, PL. 290).

During the 18th and 19th centuries eclecticism became very pronounced, and no new elements appeared in landscape painting. Imitative tendencies and a strong attachment to tradition persisted throughout the 19th century (III, PLS. 295, 296). An excellent example of such tendencies is furnished by a landscape (1812) of Wang Chêng-kuo, a work executed in the style of Wang Hui. In the 20th century, the natural scene has continued to be the favorite subject of Chinese painters, and both traditionalists and those artists who adopted Occidental styles have produced landscapes in large numbers. While it is not possible to give a detailed account of the many landscape artists of the 20th century, mention should at least be made of Wang Chi-ch'üan, who has brought fresh insight to traditional Chinese subjects. His scroll *Rocks and Water* presents a fusion of Western perspective, obtained by the use of varied planes, with a typical Chinese landscape executed in strongly contrasting tones of ink.

Japan. The love of nature so characteristic of the Japanese people has long encouraged the practice of landscape art in Japan (see JAPANESE ART). Before the introduction of Buddhism in 552, the only form of painting known there was concerned with abstract designs composed of very simple geometric devices. Only in the second half of the 6th century, when Japan entered the Chinese cultural ambient, did a veritable cultural and artistic revolution take place; among other developments, it vitalized the art of painting. The oldest Japanese landscapes are found in the paintings on the Tamamushi shrine at Hōryūji (VIII, PL. 418), whose probable date (determined on the basis of stylistic affinity with Chinese sculpture of the Sui period) is the first half of the 7th century, toward the end of the Asuka period (552–ca. 645). The paintings, which depict Jātaka scenes, are typical of this period: the landscape is reduced to a few abstract, greatly simplified elements, and space is two-dimensional. Although it is no longer possible to compare these paintings with the Chinese or Korean models from which they were undoubtedly copied, the restriction to only those elements indispensable to landscape — mountains and trees — is definitely peculiar to the Chinese painting of the same period.

The only detail suggesting anything typically Japanese is the manner in which the mountains are represented, with rounded forms and rhythmic disposition.

Other early landscapes, about a century later in date, occur in the *Kako-Genzai-Inga-kyō* (fragments in Tokyo, University of Arts; Wakayama; and Kyoto), illustrations of the Sūtra episodes from the life of the Buddha before his Illumination. This work is of great historic interest as the forerunner of the Japanese school of narrative painting on horizontal scrolls (*emakimono*). The landscape is but a crude representation of natural scenes in vivid and fresh colors, and mountains and trees are the only elements forming the background. Still other examples of early landscape painting are preserved among the treasures in the Shōsōin of Nara: excellent landscapes, which reflect the T'ang style, are found on the backs of mirrors and on metal vessels, utensils, lacquered objects, and musical instruments. The most interesting design on a musical instrument is a painting on a *biwa*, depicting three musicians and a dancer on the back of an elephant, all set against a mountainous landscape. As far as can be inferred from the few surviving examples, it would appear that the Nara period produced a great many landscape paintings, which undoubtedly followed styles then fashionable in China as well as those of preceding periods.

Although no direct artistic evidence exists, landscape painting is known to have developed rapidly during the first half of the Heian period (9th cent.), for numerous literary sources contain the names of famous artists such as Kudara-no-Kawanari and Kose-no-Kanaoka. The latter painter is believed to have executed landscapes on the walls of the Seiryōden of the imperial palace of Kyoto.

A violent civil war that broke out in China interrupted relations between the T'ang court and Japan and led to a marked decrease in Chinese influence on Japanese art. The resulting cultural isolation had the effect of stimulating the development of a purely Japanese style, known as Yamato-e (q.v.), characterized by landscape paintings depicting indigenous Japanese scenes. No 10th-century originals exist today, but the mural paintings in the Hōōdō (Phoenix Hall) of the Byōdōin (Uji, prefecture of Kyoto) give some idea of landscapes painted in the 11th century. Although these present Buddhist subjects, landscape once again forms the most important element of the composition. Green is the predominant color, and the gently rounded hills differ from the towering mountains of Chinese landscapes. The outstanding example of Heian landscape art is the six-paneled screen preserved in the Tōji of Kyoto (VIII, PL. 277). According to the tradition of the temple, this screen was brought from China in the 9th century by Kūkai (Kōbō Daishi); however, another tradition attributes it to the 12th-century monk Chinkai, and several authorities favor such later dating (11th–12th cent.). In any case, this screen shows unmistakable T'ang characteristics in the figures and costumes, while the use of color and the treatment of the landscape is definitely Japanese.

The works most typical of this period are the *emakimono*. One of the finest of these is the *Shigisan Engi* (Chōgosonshiji, Nara prefecture), or history of Mount Shigi, which illustrates the most salient characteristic of Yamato-e painting: namely, emphasis on the narrative rather than on the majesty of the landscape (cf. VIII, PL. 300).

The high point in the development of the Yamato-e style was reached during the Kamakura period (1185–1333), from which many paintings have been preserved. For the most part, in the earlier years of the period the figures still dominated the composition too much and the landscape was reduced to mere setting (VIII, PLS. 293, 296, 297); it was only at the end of the Kamakura period that landscape attained a more pure form, as a result of Chinese influence (VIII, PL. 298). Kamakura pure landscapes are found only on the *sansui-byōbu* (folding screens) and on the *kakemono* (vertical scrolls). The finest of the *sansui-byōbu* is probably the pair in the Jingoji of Kyoto, in the style of the Yamato-e school of the 13th century. Of the *kakemono* from this period, the most notable is the *Nachi Waterfall* (VIII, PL. 299), which symbolizes the deity of the great Shinto shrine of Kumano. Despite the religious significance of the composition, this is pure landscape in a style that is strictly Japanese in character — clearly apparent when it is compared with contemporary Chinese painting.

During the Muromachi period (1334–1573) landscape art, influenced by Zen Buddhism, flourished in a remarkable fashion. Renewed contact with China brought into favor ink painting in the Chinese style, known in Japanese as *suiboku-ga* ("black-and-white" art) or *sumi-e*, a technique that had been introduced to Japan during the second half of the Kamakura period. The Zen artists, in an attempt to discover the true essence of reality, moved away from superficial color effects and stress on detail in order to produce highly stylized black-and-white works. Among the earliest noteworthy *suiboku-ga* landscapists were Minchō (Chōdensu) and Josetsu, artists of the late 14th and early 15th centuries. The importance of Josetsu in the history of Japanese landscape painting is based more upon his activity as a teacher than upon his own artistic output (VIII, PL. 305).

Shūbun (mid-15th cent.), a disciple of Josetsu, perfected the Chinese style of landscape. His work is marked by a straightforward expression that was to influence the work of later artists: the mysterious aspect of Chinese landscape disappears, foreground and background become flat planes, and the entire painting is rendered more dramatic with stronger brush strokes. Of various works attributed to him, the most probable is a representation of a mountainous landscape (VIII, PL. 306).

While the work of Shūbun and his contemporaries was merely in emulation of the Chinese style, Japanese ink painting continued to acquire a distinctive character, under the impulse of the greatest *sumi-e* painter, the Zen monk Sesshū (q.v.). About 1468 he went to China to study the works of the great Chinese masters of the past. His simple composition, subtly varied tones of black, and his fresh, open perception of reality signify a vital art attainable only by an artist drawing his inspiration directly from nature. Among the many paintings attributed to him, the most famous is an *emakimono* that begins with a spring scene and ends with a winter landscape (1486; Yamaguchi, Mōri Motomichi Coll.). The style and subject reveal the influence of Hsia Kuei, the handling of ink tones that of Li T'ang. In spite of such clear Chinese influences, Sesshū brought to his work characteristics both individual and typically Japanese. Another of his works, a *kakemono* entitled *Winter Landscape* (VIII, PL. 307) painted in 1495, when the artist was about seventy-five years old, is in the technique of the Southern Chinese school known as "splashed ink" (Jap., *hatsubo-ku*) and shows affinity with the work of the Chinese painter Ying Yü-chien. In this work, deeply pervaded with the spirit of Zen, much of the composition is left empty, and the void becomes highly expressive in relation to the gray and black of the ink. A contemporary of Sesshū was Sōami (q.v.), whose artistic career was passed at the court of the shogun Ashikaga Yoshimasa; his style recalls the manner of Mu-ch'i. The rounded hills and increased depth characteristic of Sōami's work are in sharp contrast with the style of Sesshū.

A school of painting which originated during the late Muromachi period but which rose to importance during the Edo period (1615–1867) was the Kanō school (q.v.), named for its founder, the Zen monk Kanō Motonobu. Although Kanō Motonobu dedicated himself to the study of Chinese painting, his style was typically Japanese, the salient characteristics being its highly decorative character and the pronounced realism of details (VIII, PL. 313). These qualities are clearly seen in his painting *The Monk Ling-yün Contemplating Lotus Blossoms* (Tokyo, Nat. Mus.).

During the Momoyama period (1573–1615), Chinese influence vanished almost completely and gave way to a strictly Japanese style emphasizing the decorative character of landscape painting. The painters were no longer Zen monks but professional artists who worked for the great military lords, decorating their castles with large landscapes, either in monochrome or in brilliant colors on a gold-leaf ground (VIII, PLS. 319, 320). This type of painting, known as *shōheki-ga*, was executed on *byōbu*, *fusuma*, and *shōji*, as well as directly on the interior walls of edifices.

One of the famous artists of this period was Kanō Eitoku, the grandson of Kanō Motonobu; diverging from the monochrome work of his grandfather, he developed a highly individual manner in brilliant colors, with simplified forms set against a flat ground. He also painted monochrome panels, and among these should be noted his series of *fusuma* in Kyoto (VIII, PL. 318). Works in his own — that is, the colored — style include the screen *Cypress Trees* (Tokyo, Nat. Mus.) and the six-paneled screen *Hawks on Pine Trees* (VIII, PL. 353). Although the subjects are of Chinese inspiration, they are executed in a completely different manner and in a decidedly Japanese style.

Other painters of the Momoyama period drew their inspiration from the works of Sesshū instead of following the style of the Kanō school. The most prominent of this group, Hasegawa Tōhaku, founded the school named for him and painted in the *suiboku-ga* style. His finest work is undoubtedly a screen with pine trees (VIII, PL. 309), a work using the technique of the Zen artists but blending the best qualities of both the Chinese and the Japanese tradition.

The Kanō school was the official school followed by artists of the Edo period. The most authoritative of these, Kanō Naonobu, was especially noted for his landscapes, the finest of which are on a pair of screens in Tokyo (VIII, PL. 355). The style is like that of the Chinese artist Ying Yü-chien, but the brushwork is more varied, sometimes free, at times precise and detailed. Nonetheless, despite the prestige of the Kanō school, the artists who actually created new and interesting work belonged to rival schools. The school that most closely followed Japanese tradition in this period was the Sōtatsu school — based on the principles of Yamato-e — named for its founder Tawaraya (Nonomura) Sōtatsu, to whom is attributed a screen representing the Bay of Matsushima and its rocky isles (Washington, D.C., Freer Gall. of Art). The work most typical of Sōtatsu's style is a pair of screens (Tokyo, Seikadō Bunko) depicting episodes of the *Genji Monogatari*. Somewhat later another great artist, Ogata Kōrin (q.v.), adopted Sōtatsu's style. A painter of great talent, he produced remarkable compositions in the decorative polychrome style.

The notable school of landscape painting that arose in 17th-century Japan was influenced by Chinese art. This new style, known as Nanga and based on the canons of the Southern school of Chinese painting, was also called *bunjin-ga* ("literati" or "gentlemen's" painting) and was the work of scholars, officials, and writers. The most famous of these literati was Ike-no-Taiga, a student of Zen and of calligraphy who spent his life in the mountains. There he produced works of great artistic merit, among which are the series of album leaves in Kamakura (Kawabata Coll.). The simple, almost abstract style resembles the manner of the Ch'ing painters.

Perhaps the most representative of the 18th-century painters was Maruyama Ōkyo, who began painting in the Kanō style but later studied Western perspective and the realistic manner of the Ming painters. This preparation resulted in a decorative, realistic mode of painting (VIII, PL. 327) which had great influence throughout the remainder of the Edo period. An excellent example of his style is a folding screen on which are represented the rapids of Hozu (Kyoto, Nishimura Sōzaemon Coll.), a work with a great number of naturalistic details and realistic vigor. Among the followers of Ōkyo was Goshun (Matsumura Gekkei), the founder of the Shijō school. Typical of his work is the *Landscape under Snow* (Tokyo, Nat. Mus.), combining the realism of Ōkyo with the more poetic spirit of the Nanga school.

In the two and a half centuries spanned by the Edo period, a great variety of styles and an imposing number of distinct schools were developed — trends ranging from the decorative Sōtatsu to the realistic Maruyama school, and from the traditionalist Kanō style to the *bunjin-ga* of the Nanga school (cf. VIII, PL. 329). Of all Japanese landscapes, perhaps the most famous in the West are those of Hokusai and Hiroshige (qq.v.), exponents of the Ukiyo-e school (q.v.). Katsushika Hokusai studied the works of the Kanō and Tosa schools, as well as the principles of Western perspective. Fusing these techniques, he evolved an original style that is magnificently exemplified in the series of views of Mount Fuji (IV, PL. 447; VII, PL. 297), executed between 1823 and 1835. Although the mastery of perspective testifies to Western contacts, the spirit of his work is purely Japanese. The painting, marked by an intimate understanding of nature, is at the same time decorative and abstract. The prolific activity of this artist was truly phenomenal. He produced a total of at least 35,000 drawings, but his major achievement was the series of views mentioned above. Hiroshige, the other great Ukiyo-e landscape artist, may be regarded as the last of the great masters of this school. His style, more realistic and lyrical, is seen at its best in his most important work, *Fifty-three Stages on the Tōkaidō Highway* (IV, PL. 447).

With Hiroshige, landscape painting in a recognizably Japanese tradition, and with some degree of artistic originality, was virtually brought to an end. After his death, with a few notable exceptions, there was an absence of creative landscape until well into the present century, when landscape subjects began to reappear in markedly Western guise, frequently executed in the nontraditional medium of oils.

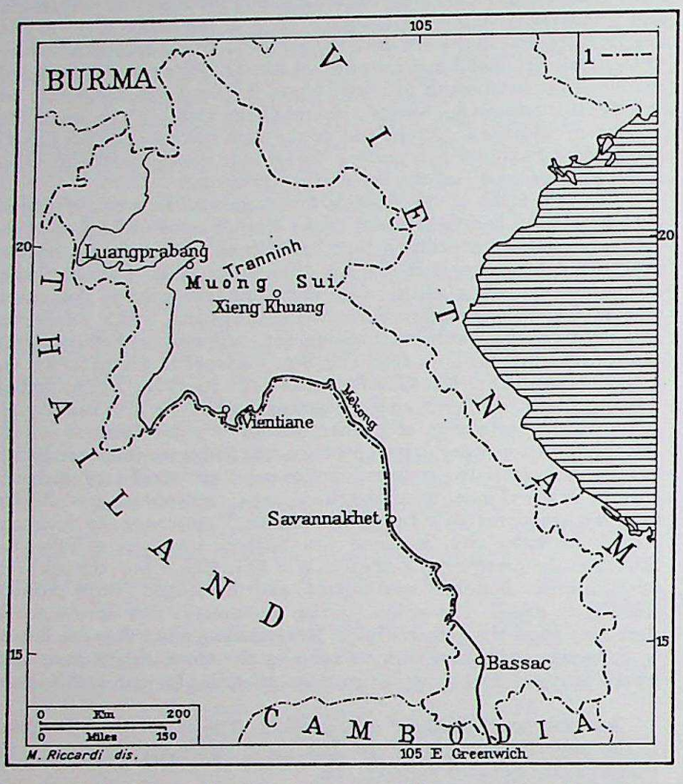
LAOS. A kingdom of southeast Asia, founded in A.D. 1353, Laos is bounded by Vietnam, Cambodia, Thailand, Burma, and China. Much of its western border follows the course of the Mekong River. The administrative capital is at Vientiane, the residence of the court at Luangprabang. Together with its predominant Buddhist religion, Laos received artistic inspiration from India. There has been little contact with Western culture, and the area has continued to produce religious architecture and sculpture in archaicizing styles and techniques dependent on the earlier cultures.

SUMMARY. Historical sketch (col. 50). Art centers (col. 50): *Province of Tranninh*; *Luangprabang*; *Vientiane*; *Mekong Valley*.

HISTORICAL SKETCH. In the valley of the Mekong River, which from the most remote times was a migration route for peoples originally from China and Tibet, are preserved numerous traces of prehistoric and protohistoric life — at Luangprabang, at Tranninh (the "Plaine des Jarres"), and in the province of Cammon. In the recorded history of the territory, the Khmer Empire (see KHMER ART) gradually extended its dominion from south to north, along the length of the valley, on the Korat Plateau, and, toward the end of the 12th century, up to the heights of Vientiane. At the end of the 13th century the Tai (Thai) kingdom of Sukhotai incorporated the lands to the west of the Mekong as far as Vientiane and the site of Luangprabang.

The formation of the Laotian kingdom was the work of Prince Fa Ngum, who had been raised at the Khmer court of Angkor. Following a military expedition that lasted from 1340 to 1350, he was proclaimed king (1353) in the city later to be called Luangprabang. His successors continued to reside there until the reign of Pothisarat, who provisionally established himself at Vientiane, which was better situated from the commercial standpoint. His son Setthathirat made the move permanent in 1560 and was responsible for building the temple of Wat Phra Keo (Ho Phra Keo) and the That Luang (1586). The wars with Burma during the second half of the 16th century resulted in the occupation of Laotian territory by the Burmese toward the end of that century, a circumstance that had some influence on the culture and art of the country. Following a period of confused succession to the throne, which began in 1694, the country was divided into two kingdoms, with Luangprabang and Vientiane as the dual capitals. The latter city sustained two Siamese invasions at fifty-year intervals: the first (1778) despoiled Wat Phra Keo, where the celebrated "Emerald Buddha" was located, and the second (1828) reduced the city to ruins. The oldest Laotian monuments that have survived date only from the 16th century. Nevertheless, since they are known to conserve a tradition with its roots in the more distant past, such works provide reliable approximations of earlier Laotian architecture.



ART CENTERS. *Province of Tranninh.* The plateau of Tranninh is the site of the architecture that most rigorously adheres to the traditional canons of Laotian art.

Xieng Khuang. At Xieng Khuang, the principal town of Tranninh province, and in the vicinity the outstanding monuments number: Wat Bun Ko, notable for the elaborate roof decoration, the gable of its façade, and the triple entrance on its front porch; Wat Si Phum, where the shrine (partially ruined) rises from a base similar to that of the That Luang at Vientiane; That Phuen, enclosing an earlier octagonal stupa with its own bell-shaped, square-based stupa having recessed corners; and That Phong Peng, one of the tallest shrines of Tranninh. Its three traditional components (base, main body, and terminal bulb) are of the narrowest diameter possible and create an extremely tapered silhouette.

Muong Sui. In this district, in addition to the Plaine des Jarres with its funerary monoliths, there are four architectural landmarks of note: Wat Thong Hak, covered by a roof of an angular severity that contrasts with the usual curve of Laotian roofs; Wat Visai, with an ornate portal on its front porch and a rear wall painted with an interesting array of Buddhas; Wat Ban Phong, a diverse group of buildings comprising a monastery, including a meeting hall of five aisles and nine bays (the two end bays separated from the others by walls in order to form front and back porches), a chapel with a sharply pitched roof (PL. 29), a library, and living quarters for the monks; and Wat Ban Mang, another important complex, with a shrine, less tapered than the one of That Phong Peng, that is one of the finest-proportioned buildings of Tranninh.

Luangprabang. This city is situated at the confluence of the Nam Khan and Mekong rivers, which have parallel currents but run in opposite directions, and the northeast sector is bounded by the two rivers. The southern part is protected by a city wall that runs from the left bank of the Mekong to the left bank of the Nam Khan. At the center of the city rises the sacred hill of Phu Si, on the summit of which is a notable Laotian monument, That Chom Si, a gilded pyramid constructed over the ruins of an older building, enlarged in 1796 and restored in 1914. Wat Xieng Thong (PL. 29), a monastery to the north of the city, is of legendary origin lost in the remote past; it was rebuilt in 1561 by King Chei Chettha. Its several buildings include a

meeting hall, chapels, shrine, and library. Wat Mai, south of the Royal Palace, was built in 1796 on the site of an earlier building in order to receive a statue of the Buddha (PL. 30). The present building comprises an aisle seven bays long, terminated at front and back by porches resting on double colonnades (perhaps added later, at the same time as the lateral pavilions). The central portal is richly embellished and surmounted by graduated tiers in a crownlike arrangement (PL. 31). Wat That, where relics are known to have been deposited in 1548, was rebuilt in 1907. The meeting hall is surrounded by a veranda. East of this is the shrine, rising from a high foundation

Laos, principal areas of artistic interest. (1) Modern national boundaries.

of three tiers. Its main body, on a square plan with indented corners, is decorated with four blind doors, each serving as a niche for an image of a standing Buddha. Above this level is superimposed a gradually diminishing series of stages, crowned by a tiny stupa.

The precincts of Wat That Luang, south of the city, contain a three-aisled meeting hall divided longitudinally into nine bays by tall square pillars, which are decorated with capitals in the form of a double row of lotus blossoms. Because there is no ceiling within, the details of the roof construction are plainly visible. South of the meeting hall a shrine was built in 1818; square in plan and with corner recesses, it enclosed an older building. It has a notable three-tiered base and a small terminal bulb resting on a bulky support. Now in ruins, Wat Manorom was built in 1372 by King Sam Sen Tai to house a colossal bronze image of the Buddha, of which only the head (ca. 6 ft.) and the torso (13 ft.) remain. Wat Visun, built by King Visun in 1503, was seen — if not wholly in its original form, at least in an older aspect than the present one — and recorded in 1867 by members of an exploratory mission to the region of the Mekong. A sketch attributed to Louis Delaporte (F. Garnier, *Voyage d'Exploration en Indochine*, Paris, 1885) illustrates the meeting hall of the complex, a beautiful building with flaring contours that recall Laotian caskets. Its wooden walls were delicately carved; but the whole was unfortunately destroyed in 1887, when the city was pillaged by Chinese pirates. The masonry hall on the site, which reproduces the earlier building with great care, was erected in 1898. The shrine, consisting of a hemispheric stupa surmounted by a conical flamelike ornament, collapsed in 1914 but was rebuilt in 1937.

Vientiane. The city of Vientiane, formerly enclosed by a defensive brick wall, extends in an arc along the left bank of the Mekong River for more than 3 miles.

Phya Wat, once a great complex of buildings, is at present largely in ruins. The three-aisled meeting hall was divided lengthwise into five bays, with porches at both the ends. The roofing has disappeared, but within remain eight tapered pillars with indented corners and a gigantic masonry Buddha on a heavily decorated pedestal. Behind this hall are vestiges of a large octagonal shrine, as well as the ruins of diverse other buildings. Wat In Peng is worthy of note for its small library (restored), which is covered with a double roof and has splayed walls. Another small and well-preserved building is a chapel with a steep masonry roof. The principal shrine is raised on a high base, formed of tiers of diminishing size.

Wat Sisaket, which dates from 1820, was restored in 1921–23 and turned into an archaeological museum. In the manner of the great temples of Bangkok, the meeting hall is surrounded by a cloister which is closed toward the outside but which opens onto an interior court; formed by a double colonnade, this enclosure is interrupted by a doorway on each of its four sides. The gallery of the cloister, with a ceiling of wooden planks painted red and decorated with golden rosettes, protects the collection of 120 lacquered-masonry Buddha images and four bronze Buddhas that stand in the corners. Along the walls are disposed a total of 3,372 niches, each containing two figures of the Buddha. The meeting hall, in the center of the court, is surrounded by a veranda that is formed by a colonnade supporting the lower roof; the walls of the hall itself support the double upper roof. The interior plan is extremely simple; the walls are ornamented with frescoes, and near the top are seven rows of ogival niches, each containing two small Buddhas of gilded terra cotta. The shutters of the doors and windows are lacquered and gilded. On the exterior of the cloister, near the western corner, rise two square shrines, with corner recesses, and a library. This square library building is raised off the ground and is surrounded by a hip-roofed veranda with four columns to a side. Supporting the veranda is a low parapet pierced with ogival openings. The interior chamber has a superstructure composed of three distinct levels, each successive stage decreasing in span. On the exterior this ceiling structure is repeated in three superimposed roofs which rise above the veranda roof and which are partly supported by the veranda columns. The terminal spire of this high roof, reminiscent of Burmese architecture, is in the form of a bulblike miniature shrine.

On the site of Wat Phra Keo (Ho Phra Keo), constructed in the 16th century to hold the famous Emerald Buddha (now in Bangkok), nothing remains except the meeting hall, which has been restored (PL. 32). This hall rises atop a three-tiered base, within a narrow square court enclosed by a low, decorated wall. The end of the hall is occupied by a large altar on which the statue of Phra Keo was once enthroned. The walls are pierced by three doors on the entry side and by two on the rear wall behind the altar, as well as by five windows on each of the other sides. These openings are framed by a motif which imitates the various elements of a building: base, pilasters, capitals, and two graduated tiers that terminate in a reliquary finial. Between the openings, the walls are covered with a coat of black lacquer decorated with gilt designs; the interior pilasters are aligned with the pillars of the veranda and the end porches. Above the quadriform roof that shelters the veranda, two receding multilayer roofs span the porches and the hall itself. These are surmounted by a third roof corresponding to the center segment of the hall.

That Luang, a monument unique in the Laotian tradition, was built in the second half of the 16th century; its original name was Lokacūḷāmani, "the crowning jewel at the summit of the universe." Like the Khmer pyramidal temples, it symbolizes the cosmic mountain that marks the center of the world and is purported to contain a relic of the Buddha. It was restored in 1898, but the pinnacle of the central shrine, which did not correspond in silhouette to that of an earlier state represented in a sketch made by Delaporte (Garnier, *op. cit.*, II, p. 291), was rebuilt in 1934, when various other parts of the building were reconstructed. Its main stupa, rising from an enclosed platform, is roofed with a square-based, domelike vault, which, as the restoration of 1934 revealed, had encompassed an older construction. At the base of each face of the stupa are shrines — a total of 30, including the taller corner structures. This number corresponds to the Ten Perfections of Buddhism (*pāramitā*), each of which has three degrees. The principal shrine rises from the summit of the stupa; the finial rests on a base composed of three tiers, the lowest of which is decorated with large lotus petals of gilded stucco. The temple is set within a square gallery entirely decorated on the exterior faces with large lotus petals. At the center of each side this gallery is broken by an arched portal crowned with the characteristic tiered roof and slender spire. Outside and concentric with this gallery is a lower wall with a small pavilion at the center of its eastern face. This wall in turn rests on a platform that has four axial chapels. The brick-paved court surrounding the whole complex is enclosed by a great cloister (ca. 260 ft. on a side), which has a triple-roofed entry pavilion at the middle of each side.

Mekong Valley. Because two of the most important monuments of the Mekong Valley, the That Phanom and the shrine of Lakhon Kao, are located in Siamese territory on the right bank of the river.

they will not be discussed here (see SIAMESE ART; THAILAND). Mention will be made of two other monuments, however, which are located farther downstream within Laotian territory but which are stylistically linked with Khmer art.

That Ing Rang, a little more than 10 miles from the modern city of Savannakhet, is a sanctuary in pre-Angkorian style that has been disfigured by restorations, which included whitewashing and the imposition of Laotian taste on the true and blind doorways. Similar changes were made in the superstructure, rebuilt to satisfy the line of a flagon-shaped reliquary spire. That the original sanctuary was consecrated to the cult of some Hindu god is confirmed by the *somasūtra* preserved within the spire. It was later transformed into a Buddhist chapel, but its purpose did not deter the Laotians from carving erotic scenes on the exterior, at both sides of the façade entry.

Wat Phu, the last of the Mekong Valley monuments before the Cambodian frontier, is the northernmost of the significant monuments of Khmer art. Some 10 miles from the city of Bassac, on the right bank of the Mekong, the temple precinct is built into the east side of a mountain, formerly named Liṅgapārvata, that was a cult and pilgrimage site throughout the history of the Khmer empire. Farther to the east extends a large rectangular pool, bounded on its western edge by a terrace from which a long causeway (ca. 900 ft.) leads toward the sanctuary. Flanked by two rows of boundary posts, this causeway rises in a gentle slope to another terrace, where it meets two quadrangular galleries (improperly known as the "palace"). Farther west the pathway continues to rise between two more galleries, after which the plan encompasses a cruciform terrace, a stairway, and a narrow terrace occupied by six small temples aligned from north to south. A final stairway, punctuated with seven landings, leads to the esplanade where the sanctuary is situated. Behind the sanctuary is still another gallery, built about a spring at the foot of the mountain. The water is conducted to the sanctuary, where it bathes the idol and a kind of linga within.

LAOTIAN ART. Artistically, Laos belongs to the southeast Asian area of Indian culture; but since the country was not founded until the mid-14th century, it was unable to benefit directly from the contributions of Indian art during the great period coeval with the first centuries of the Christian Era. Laos assimilated Indian influences from its neighbors to the south and west — Cambodia (q.v.), Thailand (see SIAMESE ART), and Burma (see BURMESE ART) — during the period when they had already adopted Singhalese Buddhism (see BUDDHISM).

There is evidence that at a relatively early period Indian architectural styles, transmitted by way of Burma, permanently influenced Laotian light architecture — that is, the corpus of architecture constructed of perishable materials, no longer available for direct comparison with possible Indian prototypes. From the time of its 14th-century foundation and from the century following, there remains only some of the sculpture of the Laotian kingdom.

SUMMARY. Introduction (col. 53). Sculpture (col. 54). Architecture (col. 54): *General characteristics; Types of buildings; Architectural styles; Conclusion.*

INTRODUCTION. It is impossible to make a study of the art of Laos comparable with those which have been made of the other schools of southeast Asia, because the surviving art of Laos is of too late a date to permit tracing its course over a period of equally significant length. The most that can be done is to distinguish certain stylistic variants in the art of different regions. Laotian art has up to the present been the object of only one ambitious study, that of Henri Parmentier (1954); it deals primarily with architecture, the sole art of Laos that has substantial interest and esthetic value and is worth while relating to other southeast Asian art.

In its treatment of architecture the present article will be limited to giving some very general notions of the different types of Laotian buildings and their principal components, in the process attempting to isolate the distinct qualities in the work of each region and to determine the various influences that may have affected it. Laotian sculpture, on the whole quite mediocre, will be dealt with first, in summary fashion.

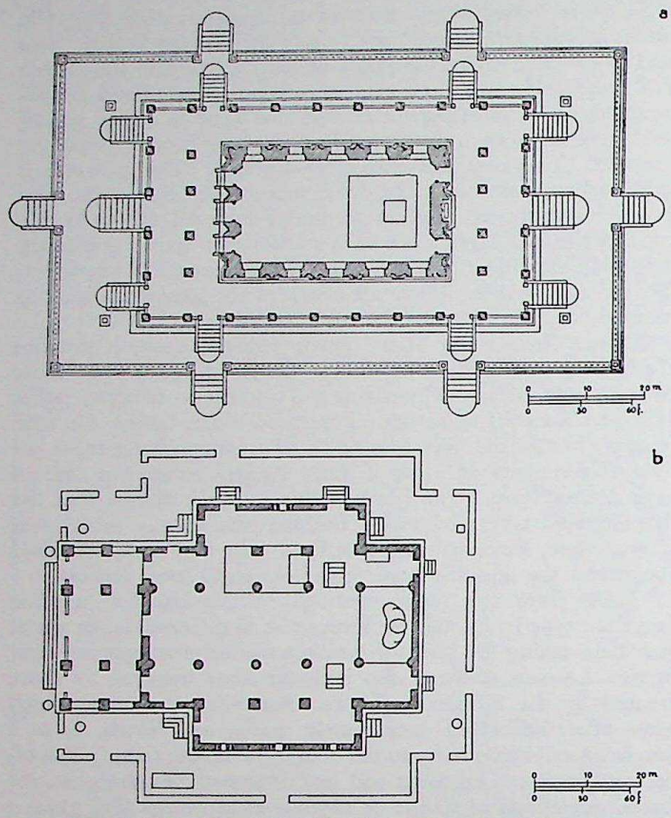
SCULPTURE. The vast majority of Laotian statues are images of the Buddha. Large works were most often executed in masonry, very rarely in solid stone; the small images were frequently of bronze (PL. 31).

In most instances the Buddha is represented seated. His hands, inordinately large, have fingers of uniform length. The head is covered with little knots of hair resembling the thorns of a breadfruit tree; the *uṣṇīṣa* is very pronounced and is surmounted by a flamelike ornament; the *ūrṇā* is either absent or merely a token indication in silver wire incrusted on the forehead. The ears are extremely stylized. The garment is completely conventional: the outer robe, which leaves the right shoulder uncovered, appears to vanish beneath the undergarment at the belt level. The rare statues of a standing Buddha have both shoulders covered, but the undergarment unexplainably remains visible. There are also some images of the Buddha adorned, that is, dressed in royal regalia.

Bronze images are often dated, but the Laotian practice of omitting the ciphers indicating thousands, and even those for hundreds, occasionally makes the calculation of dates rather difficult. None of these figures is dated much before the 17th century; but at the Wat Manorom of Luangprabang there are colossal remnants of a much older image, assigned a date of 1372 by tradition. The head of this image indicates that the characteristic type of Laotian Buddha was already established at that time, evidencing the stylized hair and ears described above and the aquiline nose found in much later versions.

Aside from the representations of the Buddha, another prevalent type in Laotian sculpture was the *dvārapāla*, or portal guardian, taking the form of a monstrous or grotesque kneeling figure. Laotian statuary also includes lions inspired by those created by the Khmer sculptors. Bas-relief sculpture, which most often decorated door panels, posts, and lintels, is as a whole superior in quality to the sculpture in the round. Principally it consists of rinceaux and leaf ornament, which sometimes frame depictions of divine or mythological beings (PL. 31).

ARCHITECTURE. *General characteristics.* Laotian architecture differs from Khmer architecture in that it did not utilize sandstone; occasionally huge blocks of laterite were the chief material, but brick was used in the great majority of structures. The bricks were held together by a lime mortar so adhesive that the builders were able to achieve a sort of compromise between keystone and corbeled vaults. However, such vaulting was used only for very small buildings. Wood generally served both for the framework and as a finishing material; tile was the usual roof covering.



Certain buildings, such as the more modestly scaled reliquary shrines, lent themselves to complete masonry construction; others, such as dwellings and some temple annexes, were built completely of wood. In the great religious structures, however, the walls were commonly of brick masonry and the roofs of wood, supported by a framework of wooden beams. "It is thus the form of covering and the distribution of its supports that dictates the plan of the building, and it is also this roof which practically by itself gives to the exterior its characteristic appearance" (Parmentier).

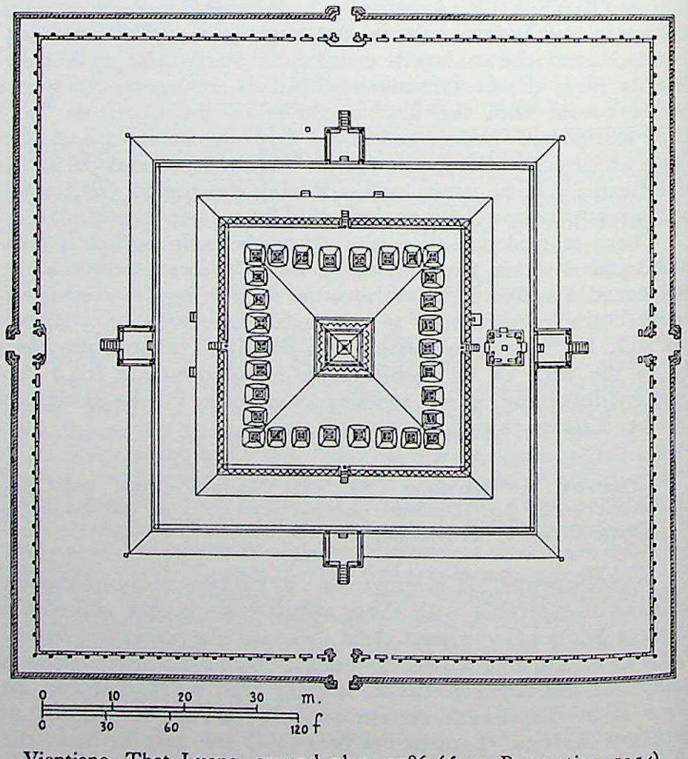
The Laotian architects used two methods of covering: the saddleback (or double-pitched) roof, and the four-sided roof. In the first type the ridge of the roof, following the main axis of the chamber it covers, extends far beyond the gable ends and side walls in order to furnish protection from the sun and bad weather. The appearance of such a building may be compared to a tent slightly elevated from the ground. The second type of structure comprises a main chamber surrounded by a gallery or veranda sheltered on all four sides, but with a roof on a lower level than the double-sloped covering of the central hall and generally of a more gentle pitch.

The Laotian timberwork did not permit uninterrupted spanning of large spaces; the architects were obliged to sustain roofs with pillars fitted into the beam system. The result was

a chamber divided lengthwise into three aisles, subdivided into as many bays as the number of supports made necessary.

The decoration of walls and moldings was executed in a plaster finish, the work being accomplished in two stages: first the mason outlined the general scheme and roughly executed the masses; then followed the artists, working with threads

Types of *wat*: (*a*) Vientiane, Wat Phra Keo, 16th cent.; (*b*) Luangprabang, Wat Xieng Thong, first rebuilt 1561 (*from Parmentier, 1954*).



of nearly dry lime that they applied over the layer of wet plaster. Finally, small beads and pieces of glass-enameled lead were sometimes added for surface enrichment.

Types of buildings. The only Laotian architectural type that has evidenced a degree of artistic genius is the Buddhist monastery, or *wat* (FIG. 55). The essential building of the complex is the hall — in Laotian, the *bot* (Skr., *uposathāgāra*) or *vihan* (Skr., *vihāra*) — where religious rites are celebrated by the monks of the community and where laymen come at each quarter of the moon to hear the monks expound doctrine and to celebrate the great holy days. In the simplest monasteries this hall is supplemented only by monks' quarters of wood and thatch. The more important monasteries contain in addition, whether or not enclosed by walls, various subsidiary buildings: reliquary shrines (*that*) similar to the Indian stupas, chapels, and libraries.

On the basis of plan, the meeting halls erected by Laotian architects can be divided into three principal types: a simple hall covered by a saddleback roof; a hall surrounded by a veranda, from which it is separated by an interior wall supporting the roof; and a hall with a surrounding gallery, the roof of which is supported by an exterior wall. Access to the hall is commonly through one or three portals in the front wall and occasionally by two other doors situated in the rear wall, one on each side of the altar on which the throne of the great cult statue of the Buddha is placed, his back to the wall.

The hall is given its characteristic appearance by the two-sided, double-pitched roof. The gables take the form of an acute angle, resulting from the inward curve of the roof line, which also determines the aspect of the end façades. In the examples at Tranninh and Luangprabang, where the side walls are very low, the roof declivity is excessive and, because of this condition, takes on great importance in the over-all appearance; the outline has been compared to the wings of a laying hen (PL. 29). In the Wat Phra Keo at Vientiane, where the walls are much higher and the veranda is roofed on four sides, the effect is quite opposite; the proportion of the roof to the whole of the building is less striking (PL. 32). When the meeting hall is of the simple type, as it most often is at Tranninh and Luangprabang, it is generally divided into three aisles by two rows of pillars and is extended by a porch on both end façades. At Vientiane, on the contrary, the hall is most often surrounded by a covered veranda, the roof of which is supported on pillars. In the case of the triple-aisled hall, this interior division is reflected on the façade by the four pillars supporting the wooden gable, which in turn sustains the end projection of the roof.

This long roof, the horizontal arris of which is slightly concave and rises at the extremities, is without doubt the most characteristic architectural element of the meeting hall. It is related to a type well known in the Far East and in southeastern Asia, occasionally termed "telescopic"; that is to say, it consists of successive detached elements and projections over the various parts of the substructure. "These roofs, which are extremely heavy because the careful tiling is always put down in double layers, are sustained by raised trusses of a flexible type. In other words, all the pressure resolves on an enormous horizontal beam, holding up the entire weight by means of a series of small struts and tie beams. There are almost never rafters .... This roof is borne by the walls and the pillars that frequently divide the aisles" (Parmentier). On the exterior the roof is further characterized by the hornlike ornaments that terminate the peaks at each end and the shepherd's-crook forms at the eaves of the front and rear façades. It should be noted that in the Laotian structures, unlike those in Cambodia and Thai-

Vientiane, That Luang, ground plan, 1586 (*from Parmentier, 1954*).

land, there are never transverse roofs corresponding to a transept. From this point of view the Laotian roof appears much simpler, or more primitive. On the other hand, as has been noted, some Laotian meeting halls are elaborated with porches on the façades, an architectural feature unknown in Cambodia.

Inside the hall the framework of the roof is supported by pillars that taper slightly toward the top. These supports are never set on bases. The capitals, purely decorative, in most instances resemble large-petaled lotus flowers. While the architects of Tranninh and Luangprabang used only round columns, those at Vientiane used square pillars with recessed corners. Most hall interiors are without ceilings, except over the last bay at the rear, where the large image of the Buddha on a pedestal is located. When there is a ceiling, it is composed of square coffers of red-lacquered wood, ornamented with gold rosettes.

In the meeting halls of Tranninh and Luangprabang, where the walls are not high, the windows are small and the interior is poorly lighted; but at Vientiane, where the walls are much higher, the windows are more important elements. In general, the openings in the walls, whether for windows or doors, are of two types: either arched or rectangular and slightly trapezoidal. The exterior framing of these apertures resembles the silhouette of a building placed in relief against the wall. It comprises a base beneath the opening, decorative supporting elements at the sides, and a cornice topped with crownlike ornamentation — a very rich composition, further embellished with small pieces of glass set into the plaster surface. The window shutters are soberly decorated; those of the doors are much richer and are frequently carved with rinceaux or leaf patterns framing human or divine figures.

It is obligatory for the meeting hall to contain, in the segment farthest from the entrance, a great statue of the Buddha. It is a seated, frontal image that rests on a decorated pedestal, with its back against the rear wall or separated from it by a small passage (PL. 30). Before the pedestal is an altar where offerings are deposited. To the left of the Buddha image, in a bay adjacent to that containing the statue, there is a pulpit, a small construction of gilded wood on a masonry base. Among other furnishings, many halls contain seats for ecclesiastical dignitaries, cabinets, and chests for storing manuscripts. The chests are made in the form of inverted pyramids, similar in appearance to Laotian sarcophagi. The most distinctive furnishing, and that which most inspired the metalworkers, is the candelabrum (PL. 32): its armature consists of a horizontal arc of iron representing the bodies of two reptiles, their backs bristling with points, their tails knotted at the center, and their heads raised at the extremities of the piece. The knot formed by the interlaced tails is supported by fifteen vertical shafts that, above the knot, terminate in flamelike points which serve to hold the candles. The center vertical is the tallest, and from it those on each side diminish in height, so that the whole forms a decorative, comblike triangle resting on the knot. Another object peculiar to the meeting halls of Luangprabang is a type of water vessel called *hang-lin*, a wooden barrel topped on one side by a funnel and on the other by a spout in the form of a monster's head. It was used for the purification of images of the Buddha.

Among the buildings annexed to a Laotian monastery the most significant is certainly the reliquary shrine, rarely absent even in the poorest monasteries. Its importance should not be measured by its dimensions, which can be comparatively small, but by its religious value. It is, in effect, the Laotian version of the stupa, an important feature of Indian, Singhalese, and Burmese religious architecture, or the chaitya of Khmer or Siamese art. Such structures are objects of fervent veneration from faithful Buddhists, whether the building constitutes a true reliquary containing remains of the Buddha or some holy person or whether it is simply a commemorative monument.

The reliquary shrine, or *that* (Skr., *dhātugarbha*), is designed in a great variety of forms. Apparently the architects were receptive of diverse influences that combined to inspire small buildings of almost infinite variety. The only common characteristics are the complete masonry construction and a distinctive element, derived from the stupa, that always appears between the foundations and the terminal spire. This essential element can assume either the original hemispherical stupa shape or that of a bell, bulb, flask, or the like. Each of these is in turn subject to many variations; nonetheless, three principal types of reliquary may be discerned, among which the innumerable transmutations can be found. The first, derived directly from the stupa, is characterized by the curves of its profile and is set upon a base that has been subordinated to the structure as a whole. The second type gives the base a value equal to the main body of the stupa, which retains the typical curvilinear profile. The base thereby becomes a cubic mass forecasting the development of the third type, in which the base becomes the principal component of the building. In this third variant, the stupa is simply a terminal accessory integrated with the spire; the building takes on the aspect of a Khmer tower with four blind apertures, rising from a substantial base and surmounted by a pyramid of gradually diminishing stages. All that remains of the original stupa form is a subsidiary element with a curved outline.

After the reliquary shrine, in order of significance among the other buildings of the monastery complex, come the chapels built to hold images, structures that are most prevalent at Luangprabang. As a rule, these are low masonry buildings containing a long hall covered with an ogival vault. The façade, with a single entrance and rich decoration in plaster, has a roughly spadelike contour. The libraries, built either of wood or of wood and brick, are raised on a high base with moldings, intended to protect them from the dampness of the ground and from gnawing insects. The walls spread out toward the top, recalling the inverted-pyramid shape of the manuscript chests and the sarcophagi.

Finally, mention should be made of the enclosure walls for the precincts of the important monasteries. There are sometimes several successive circuits of such walls, quite imposing in extent; however, the gateways are not so richly decorated as those of Cambodia and Champa.

Architectural styles. After this brief analysis of the architectural elements of the Laotian Buddhist monastery, it is appropriate to indicate the distinguishing characteristics of the various building types from the three major regions into which the country is divided: namely, Tranninh, Luangprabang, and Vientiane.

The Tranninh Buddhist temples (PL. 29) reflect a type of building characteristic of the region as a whole. They are composed, almost consistently, of a simple hall of three aisles formed by two rows of round columns. At each of the two ends of the building there is a porch covered by a roof separate from that over the main body of the hall; the roof of the aisle rests on the porch roof. Access to the hall is through two doors, one on the front porch, the other in the posterior wall, to the left of the great statue of the Buddha at the end of the hall. The interior is lighted by windows with wooden balustrades. On the sides the roof descends very low and has a wide, sheltering overhang. The projecting roofs of the hall and the porches, one above the other, are sometimes accented by another small roof element set above the center of the hall roof.

The buildings of Luangprabang (PL. 29) differ little from those of Tranninh, except that masonry is used more generously and the roofs often become less prominent because of the greater height of the walls. The meeting halls in general have only one porch, sheltering the entrance on the main façade.

The style of the buildings at Vientiane, many of which are in ruins, is quite homogeneous. The meeting halls (PL. 32), generally of vast dimensions, have walls of masonry that rise to a great height, while the roofs never descend so low as those at Luangprabang and Tranninh. These buildings are sometimes amplified with a veranda around all four sides; in other instances they are closer to the system usual at Tranninh, that is, three aisles terminating in two porches. The columns are never round as at Tranninh and Luangprabang but are square in section, with notched or recessed corners. Their great height makes it possible to mask the wooden roof supports with a ceiling, at the level of the top of the outside walls. This system of support generally remains visible in the other two main regions. The doors and windows are trapezoidal; their frames, composed of pilasters disposed on multiple planes and capped with a series of superimposed tiers, differ distinctly from those of the other regions, which use the blind *prasat* style of decoration for their apertures.

Conclusion. The essential elements of Laotian architecture, in the north as well as in the south, aside from occasional Burmese or Siamese nuances, present a mixture of two different styles: the first is the light construction with simple steep roofs characteristic of the building of all primitive peoples of southeast Asia; the second reflects an ancient Hindu tradition of medium-weight architecture, characterized by the curvilinear roof, which in Laos has left traces in the design of apertures, and in several monuments very archaic in appearance, either in their over-all composition or their ornamentation.

To the question of how such Hindu influence in Laos — which must have come through Buddhism, inasmuch as no traces of Hinduism itself have been remarked — could have been introduced, Parmentier answers that there must have been a penetration from the north, from Burma; but it is a hypothesis yet to be substantiated. The continuance of a light autochthonous architecture, with walls that flare at the top, a feature common in the architecture of most southeast Asian countries, can be explained more readily. "The impermanence of the materials in which the forms were realized guaranteed the preservation of the traditions followed when they were originally executed. By the very fact that such buildings demanded continual maintenance and frequent rebuilding, the workers kept alive the skill" (Parmentier). It should be added that this Laotian light architecture never developed a counterpart in stone because the country never gained sufficient power and eminence for its kings to have the means to erect monuments comparable with those of Cambodia and Burma.

LARGILLIÈRE, NICOLAS DE. Painter of the French school (b. Paris, Oct. 10, 1656; d. Mar. 20, 1746). Although born in Paris, Largillière was brought up in Antwerp, where at the age of twelve he entered the studio of Antoine Goubaud, a painter of peasant scenes and still life. By 1672 Largillière had become a master of the painters' guild in that city. From about 1674 until 1680 he worked in London, painting draperies and still-life accessories for Lely (q.v.). In London Largillière painted his first portraits, but none of his early work survives. Because of anti-Catholic sentiment in England he returned to Paris after Lely's death, and by 1682 he had established himself among the many Flemish artists of that city. With the aid of Adam van der Meulen, a Flemish painter resident in Paris, Largillière met Charles Lebrun (q.v.); he then presented himself at the Académie Royale and was admitted in 1683. In the Académie Largillière rose steadily and became director in 1728, retaining that post until he resigned in 1742. His residence in Paris was continuous except for a visit to London in 1685, where he painted James II and his queen at the time of their coronation. In 1699 he married Marie-Elizabeth Forest, daughter of a landscape painter.

Although Largillière occasionally painted religious subjects and still life for his own satisfaction, he made his reputation as a portraitist of the Parisian *bourgeoisie.* As official painter to the *corps de ville* of Paris, he executed five group portraits of them, which were his most important commissions. Of this series, commemorating notable public occasions, only one survives — *Échevins of the City of Paris before Ste-Geneviève* (1696; Paris, Church of St-Etienne-du-Mont). His enormous production (P. J. Mariette mentions some 1,500 works by him in and around Paris alone) included types ranging from imposing state portraits and the great groups executed for the city to more intimate, and often more profound, portraits of artists and friends. Largillière's style was fully developed within the tradition of Rubens and Van Dyck, in London as well as in Antwerp, before his arrival in Paris. When in Paris — like J.-B. Jouvenet, C. de Lafosse, and Hyacinthe Rigaud (q.v.) — he promoted the colorism of the north. According to an account left by his pupil J.-B. Oudry, Largillière encouraged in his pupils great sensitivity to color; he was among the first to recognize this gift in Chardin. His delicacy of touch and fondness for the fleeting effects of light and color, already apparent in some of his 17th-century work, anticipate the rococo lightness soon to prevail.

REPRESENTATIVE WORKS. *Charles Lebrun* (his diploma picture, 1686; Louvre); *Mme de Thorigny* (1696; Met. Mus.); *Louis XIV and the Royal Family* (1708; London, Wallace Coll.); *President de Laage* (Louvre); *Mme de Gueydan as Flora* (V, PL. 406); *Portrait of the Artist with His Wife and Daughter* (XII, PL. 160).

LATE-ANTIQUE AND EARLY CHRISTIAN ART. This article concerns the art and architecture of the Mediterranean world from the second half of the 3d to the first half of the 6th century. With reference to the development of the Roman Empire, which unified the area politically and juridically, the late-antique period begins in the Severan age and ends in the reign of Justinian. On occasion it will be necessary to overstep these limits in order to study artistic developments anticipating the late-antique period proper, as well as to note others that extended its characteristic qualities beyond the era of Justinian (see AFRICAN-ROMAN ART; BYZANTINE ART; COPTIC ART; DANUBIAN-ROMAN ART; EGYPT; EGYPTIAN ART; EUROPE, BARBARIAN; GALLO-ROMAN ART; HISPANO-ROMAN ART; ISLAM; ITALO-ROMAN FOLK ART; PARTHIAN ART; ROMAN ART OF THE EASTERN EMPIRE; SASSANIAN ART).

The unfolding of the late-antique "life cycle" required about the same length of time — some three centuries — as did that of the Hellenistic period (see HELLENISTIC ART). The geographical scope of the work involved was much greater, however, comprising south-central and western Europe and North Africa, in addition to the Hellenized East. The multiplicity of peoples and cultural traditions within this vast area gave rise to fruitful blendings of artistic taste, which contributed decisively to the formation of the medieval world.

SUMMARY. Introduction (col. 60). Architecture (col. 68): *Introduction; Architectural elements; Interior layout; Development of the religious sanctuary: a. Pagan; b. Jewish; c. Christian. Regional development of late-antique architecture: a. The West; b. The East. Secular structures: a. Domestic architecture; b. Official buildings; c. Palaces and villas; d. Commemorative monuments and funerary architecture; e. Functional structures (aqueducts, cisterns). Late-antique city planning.* Sculpture (col. 99): *Sculpture in the round; Portraiture; Relief; Porphyry; Stucco.* Painting and mosaics (col. 118): *From Septimius Severus to the era of the Tetrarchy (193–286); From the Tetrarchy to Arcadius (286–408): a. Court style; b. Rome; c. Alexandria; d. Syria-Mesopotamia; e. North Africa, Sicily, and Iberia; f. Other European centers. From Theodosius II to Justinian I (408–565): a. Rome and Italy in the 5th century; b. The East during the 5th century; c. Constantinople from Zeno the Isaurian to Justinian the Great; d. Manuscripts.* Minor arts (col. 137): *Coins and medals; Jewelry; Glyptics; Silverwork; Ivories; Textiles; Glassware.*

INTRODUCTION. The concept of a distinguishable late-antique art was introduced in the scholarly literature by Alois Riegl in 1901 in the more limited formulation of *spätromisch*; Riegl's analyses contributed importantly to the rejection of the outmoded view that the art of the 4th and succeeding centuries was merely a debased form of classical art. Riegl's Viennese colleague Franz Wickhoff, in his *Die Wiener Genesis* (1895) — the full title of the English translation, *Roman Art: Some of Its Principles and Their Application to Early Christian Painting*, gives a truer idea of the work's scope — had previously informed his contemporaries of the fact that absence of "academic correctness" and the departure from the "classical manner" did not signify an involution or regression of art but rather corresponded to a new and consistent attitude in the visual arts, an attitude that provided the foundation for the ensuing medieval art cycle. Subsequently, understanding of

late-antique art was significantly advanced by the work of four scholars: Gerhard Rodenwaldt, Guido von Kaschnitz-Weinberg, Hans Peter L'Orange, and Richard Delbrück.

* *

The study of late-antique art is inseparable from a study of the history of the period. In the mid-3d century the Roman Empire was on the verge of destruction. Under the emperor Gallienus (260–68) there had been so many separatist movements that the era of his reign became known as that of the "Thirty Tyrants." Postumus and his successors were supreme in Gaul, Spain, and Britain (258–73); Zenobia commanded the Asiatic provinces from her capital at Palmyra (267–73). Only by the superhuman effort of the Illyrian emperors, culminating in the reigns of Diocletian (284–305) and Constantine the Great (306–37), was disaster averted. In a sense, the unity of the Empire was recovered by the discipline of a glorified sergeant-major who affected the trappings of an Oriental despot, supported by an enormous army and efficient civil service financed by crushing taxes. Moreover, it was realized that the Empire could no longer be controlled and defended by a single emperor; the porphyry group of the Tetrarchs (PL. 56), once at Acre and then built into the wall of S. Marco in Venice, is testimony to this change in the system of rule. The decision to rule the Empire with coemperors and Caesars, formulated under Valerian (253–60), was given renewed force by Diocletian and by Constantine's insistence on the "felix progenies Constantini"; it became systematized under Valentinian I (364–75) and endured until the capitulation of Romulus Augustulus to Odoacer the Ostrogoth in 476.

In the 4th century Rome ceased to be the capital of the Empire to which it had given its name. Realizing that the West might prove strategically untenable before the barbarian invasions, Constantine I determined after the official recognition of Christianity (A.D. 313) — clearly one of the most significant events in the evolution of late-antique art — to set up a "New Rome" in opposition to the recalcitrant paganism of the old capital. Diocletian had ruled for a time from Nicomedia, but Constantine founded his new capital (consecrated in 330) on the opposite shore of the Sea of Marmara, on the site of the little town of Byzantium. At various times Vienne in southern Gaul, Trier in Germany, Sirmium in Pannonia, Milan, and Ravenna all became imperial residences and seats of government. When the West finally succumbed to the barbarians, the foresight of Constantine was vindicated. The wealth and manpower of Asia Minor, controlled from Constantinople, was to preserve the Eastern Roman Empire for nearly a thousand years more. Nevertheless, until the end of the 5th century, Rome continued to enjoy great prestige; and it would be a mistake to consider, as some scholars have done, the first sack of Rome in 410 by Alaric as an overwhelming catastrophe and the decisive event in the fall of the Western Empire. It aroused prophetic groans from St. Jerome and encouraged St. Augustine to write *De Civitate Dei*, but the city was more grievously plundered by the Vandals in 455 and also suffered greatly from the entry of Ricimer in 472.

John BECKWITH

In general, the formal development of the late-antique period may be characterized as a transition from detailed articulation to an intense simplification of forms. This over-all tendency holds true for the evolution of forms in the very widest application of the term — not merely in art but also throughout the political, economic, and social life of the time.

Under the early Roman Empire human existence, both in the cities and in the countryside, presented a seemingly infinite spectrum of local variation and was marked by advanced economic development of the individual regions and by autonomy of the community of citizens. During the late-antique period these autonomous local units disappeared; instead of independent individuals forming natural groups, there were disciplined men integrated into the cadres of the state. Members of all classes, and especially those of less privileged economic levels, were bound to their professions and trades under strict supervision. What was true for the individual was also true for the social unit: municipalities were no longer free to manage themselves but were firmly harnessed to the needs of the state. The result of this all-pervasive centralized control was a general "immobilization" of the social life.

The soldier-emperors' simplification of the machinery of state along the lines of the military was accompanied by militarization of the civil service and by assimilation of military law by the civil code. Men submitted en bloc to the commands of the state. On this massive and unconditional obedience was superimposed a soldierly order that introduced military terminology and organization into every aspect of life. Militarism became the pattern of the new society, and therein lay the essential difference from earlier times. The contrast between the civil and the military order is the contrast between the organic, natural grouping of individuals and the mechanical coordination of masses, between the free formations of nature and masses composed of files, columns, and squares.

The formation of blocs in the life of the state found a close parallel in the compact structure characteristic of the art and architecture of the time. The retreat from organically developed details within the sculptural mass corresponded to a new sense of compactness of mass elsewhere. Architecture was dominated by massive walls that dispensed increasingly with traditional ornament; the classical sense that each architectural detail merited its own identity, its own esthetic value and expressiveness, was extinguished in these overpowering masses. Thus it was an accepted canon that constructional elements which are not homogeneous may coexist in a single building, and the reuse of "spoils" taken from older buildings became a commonplace. The eye of the observer traveled over the great expanses of wall, unbroken by striking details; his gaze was directed to the breathtaking, uninterrupted ascent of the vaulting and met with an interminable succession of wall surfaces articulated in a repetitive and monotone manner.

The transition from differentiated to compact, simplified mass was accompanied by a change in treatment of subject, from the concrete to the abstract, from the corporeal to the symbolic. The general tendency was away from the organic movement of natural forms toward the abstract rigidity of types. Still, at the same time that artists began to produce works ever more schematic and generalized, they endowed them with a content more profound and inherent. The art object became a kind of receptacle for a kernel that embodied an idea; made into a conventional formula, the object became more and more a sign which pointed to a thought and which, as a sign, remained always equal to (i.e., capable of being perceived as) itself. The late-antique rinceau, for example, was no longer a living tendril as in classical times but became instead a lifeless band: the volutes are uniformly circular, and the whole plant is an abstract ornament lacking organic vitality and truth to nature. Moreover, such ornament possessed a new "inwardness," a life that seems to subsist outside the order of nature. When a plant grows in the form of a cross or springs from an altar chalice, it is filled with new meaning, it becomes a symbol of Christ and the Sacrament. In the late-antique period, the objects of art forfeited their substance, their corporeal nature, and in turn were transformed into symbols and conceptual images, with enhanced intellectual and spiritual content and powers of suggestion.

Human figures are presented not as individuals but as fixed types. The martyrs in the processional mosaic of S. Apollinare Nuovo in Ravenna (III, PL. 301) float as incorporeal spirits against a background of the palms symbolic of victory. The most striking feature of these grave figures is their enlarged and staring eyes, which the ancients associated with the idea of the divine and which give them a rapt expression. Individuals have yielded to stereotypes, with a conceptual significance concerning the nature of sainthood and its place in the eternal order. Similarly, in images of the emperor distinct personal traits give way to a *typos hieros* appropriate to the imperial dignity. Like the saints, the emperors become "semblances,"

Dioceses and provinces of the Western Roman Empire. *Key*: (1) boundary between Western and Eastern Empires in A.D. 395; (2) boundaries of dioceses organized by Diocletian; (3) boundaries of provinces organized by Diocletian; (4) residences of the Praetorian Prefect; (5) diocesan capitals; (6) patriarchates; (7) ecclesiastical metropolises (archdioceses). Dioceses organized by Diocletian: (VIII) Illyricum (after 395, Pannonia; Prefecture of Illyricum); (IX) Italia Annonaria, (X) Italia Suburbicaria, (XI) Africa (Prefecture of Italia); (XII) Britannia, (XIII) Gallia, (XIV) the "Seven Provinces," (XV) Hispania (Prefecture of Galliae). (*From F. van der Meer, C. Mohrmann, Atlas of the Early Christian World, London, Edinburgh, 1958*).

Dioceses and provinces of the Eastern Roman Empire. *Key*: (1) Boundary between Eastern and Western Empires in A.D. 395; (2) boundaries of dioceses organized by Diocletian; (3) boundaries of provinces organized by Diocletian; (4) residences of the Praetorian Prefect; (5) diocesan capitals; (6) patriarchates; (7) ecclesiastical metropolises (archdioceses). Dioceses organized by Diocletian: (I) Aegyptus, (II) Oriens, (III) Pontus, (IV) Asiana, (V) Thracia (Prefecture of the East), (VI) Macedonia, (VII) Dacia (Prefecture of Illyricum). (*From F. van der Meer, C. Mohrmann, Atlas of the Early Christian World, London, Edinburgh, 1958.*)

and their faces are expressive types conveying qualities more lofty and more elemental than their human identities. These late-antique facial types may be compared to ancient theater masks, which "represented" the part played by the actor and also served to conceal his own features. Inner meaning supersedes the natural appearance of things and is schematized in new modes of expression and compositional types. Figures are no longer depicted in varied natural groupings but are collected into a whole that has a fixed organization corresponding to some essential inner meaning. Characteristic of late-antique art are symmetrical compositions in which an array of figures is as if choreographed around the dominant central figure of the emperor. Typical also is the disposition of figures in registers, one above the other, according to rank in the imperial or celestial hierarchy. The scale of the figures is freed from the laws of empirical observation, for the relative size of the figure does not correspond to its true dimensions but to the importance of the individual represented.

The same shift from outer to inner qualities is found in esthetic ideals as well. The beautiful no longer resides in perfectly proportioned bodies, as the classical tradition maintained, but in the "inner light" of form, that is, in the spiritual intent and expressiveness. According to Plotinus, the body is beautiful only when illuminated by a soul; the beautiful is thus the consequence of inner form or essence. This esthetic is closely related to the representative philosophical currents of the late-antique period, according to which the natural life of the senses, the life "of the flesh," is merely an inferior form of existence. The soul is celestial essence that must be freed from matter and made independent of corporeal nature and concepts induced by the senses. Man must withdraw from the external world of appearance, from the natural world and the "beautiful body," to the verities of inward contemplation and to the world of symbols and ideas. This philosophical and spiritual withdrawal into the realm of abstraction is strongly reflected in the art of the late-antique era. Beyond the fleeting and unstable natural world, the artists and theorists glimpsed the broad, regular outlines of an immutable hierarchy of forces and ideas, of substance and essence; and they strove to capture this eternal order with new abstract modes of expression, through conventional expressive types and fixed forms of composition.

Everywhere there is the same denial or negation of the concrete, of the plastically determined and limited. Gods and myths lose their corporeal reality and acquire new, more profound content in allegory and symbol. The myth is a human contrivance or falsity, but an illusion that holds some truth.

There is an ineluctable attraction toward simple absolutes: for example, in triumphal art the historical victory becomes "eternal victory," and the historical victor the absolute victor (*victor omnium gentium*). The reliefs on the Arch of Constantine in Rome include not only representatives of the peoples actually conquered by Constantine but representatives of all Rome's enemies. Such abstract humanity is clearly present in late-antique portrait sculpture, where from the end of the 3d century the gaze acquired a new expressiveness. Not focused on surrounding things, the subject looks out beyond space and time, toward some distant object outside the reality of the senses. As mirror of the soul, the eye became the most significant physiognomic feature in late-antique art.

Late-antique architecture may also be examined from the standpoint of this turn toward inner values. It is significant that the great expanses of wall surface convey an idea of spatial unity altogether at variance with that of the finely differentiated forms of the architecture which had gone before. The attention is focused upon the space enclosed rather than on the tectonic units. The ancient way of building, that well-ordered system of architectural ornament which artists such as Vitruvius had conceived as the *dignitas* of architecture, was abandoned in favor of effects of incorporeal space and elusive depths of light and shade. The increasing immobilization of social life was matched by contemporaneous efforts in art and architecture, in philosophy and religion, to fix individual components within the framework of an immutable system. A geometrical system of coordinates dominated the planning of building complexes such as the Palace of Diocletian at Spalato and the caravan city of Palmyra. Faith and doctrine were combined in rigorous schemata that when fully developed were diametrically opposed to the multiplicity of the ancient religions and their dialectical conception of life. In the realm of thought, there was a general movement from the dialectic attitude toward the dogmatic and authoritarian, from empirical knowledge and relativism toward theology and theosophy. Neoplatonism broadened into a speculative theology that sought to comprehend all the cults of antiquity except Christianity. Christian doctrine itself manifested a stability that eventually concretized in Catholic dogma. The tendencies encountered under the Christian emperors, the striving to bring all religious life within the bounds of a "state church," were already discernible in the time of Aurelian and under the Tetrarchy.

In all aspects of collective life there was an evolution (and an involution) toward simple, massive forms and statically compact wholes. It is as if life itself, in the process of the gigantic, perilous, and all-embracing transformation leading from antiquity to the Middle Ages, put on armor and took refuge within the solid blocs and impregnable systems of the state, as well as those of art and religion. Indeed, at this time the cities of Rome and Constantinople — and the entire Roman Empire behind the limes — were enclosed within the most powerful fortifications known to the ancient world. The life of the period seemed ready to sacrifice liberty and mobility for security and stability. And who can say whether the seed of future development would have been able to survive without this protective shell?

Hans Peter L'Orange

Architecture. *Introduction.* The late-antique period cannot be easily circumscribed with firm chronological limits. For the history of architecture, the period of the Tetrarchy has come to be commonly regarded as the beginning date for the earliest phase, though a number of elements characteristic of late-antique architectural style can be traced back to an even earlier time. The great transformation of the style can first be discerned in the monumental Christian buildings undertaken in the reign of Constantine the Great. The line of demarcation separating late antiquity from the Middle Ages is equally difficult to fix with precision. Although the second half of the 6th century may be said to mark a definite break in the political continuity of the West, and especially in Italy, Roman architecture at the beginning of the 7th century evidenced no substantial change with respect to established tradition. In the East, however, the progressive Arab conquest of large areas of Christian territory in the mid-7th century clearly initiated a new epoch, as was to become gradually but decidedly evident. It might be maintained, hence, that the effective transition between late antiquity and the Middle Ages came about in the course of the 7th century.

The geographical extent of the late-antique comprises those areas marked by Hellenistic-Roman culture. Contemporary developments within the Sassanian and Arab empires are not included in this definition, and the influences exerted by these cultural spheres upon the late-antique development, and vice versa, is consequently looked upon as a separate problem. Historically and geographically, therefore, the study of late antiquity treats of the areas constituting the late Roman Empire proper and its sphere of influence. It also encompasses the various ephemeral barbarian states that had been established within the bounds of the Empire, particularly in the western segment, regardless of whether they were *foederati* of Rome or fully autonomous political bodies.

Although, in a broad historical perspective, the late-antique synthesis was founded in the heritage of Hellenistic-Roman culture, it also included the contributions of many peoples, often very distinctive and strongly contrasting in character, each with a lengthy history and traditions of its own. The decided differences between East and West were manifested in the division of the Empire in A.D. 395, which was but a final resolution of divergencies whose roots were much older than the late-antique era. In the development of architecture, this contrast was already to be detected below the surface of the

seemingly homogeneous art of the early Roman Empire. Moreover, the two halves of the Empire were in no sense closed and self-consistent entities, for within each there were numerous, even if sometimes only transitory, opposing tendencies at work.

Almost everywhere, local traditions asserted themselves more strongly than in previous epochs, and distinct provincial styles developed. Lines of demarcation tended to be fluid, and specific historical factors often generated novel trends that bypassed traditional practice. These observations are applicable to both the eastern and the western spheres of late-antique culture. In the 3d and at the beginning of the 4th century an official imperial architecture, not restricted to one specific center, had been a common denominator of style. From A.D. 312 until the founding of Constantinople in 330, the architectural enterprises of Constantine the Great were concentrated in Rome. Thereafter, the focus of building activity shifted to the new eastern capital, which in the 5th and 6th centuries became the undisputed architectural center of the Eastern Empire and exerted a manifold influence on all the provincial styles.

From the 3d to the 6th century of our era, the architecture of the Italian mainland was characterized by great variety. In the 3d century Rome still occupied a commanding position, with a style based primarily on its own architectural heritage; but from the Severan period onward, Oriental elements were to be observed in an ever-increasing degree, variously in details such as capitals or in whole architectural complexes such as the great nymphaea (e.g., the Septizonium on the Palatine, Rome). Roman architecture enjoyed a resurgence under the Tetrarchy and in the reigns of Maxentius and Constantine the Great. After the founding of Constantinople, however, this creative impulse weakened, very likely as a consequence of the general decline in building activity in the western areas. Along with this loss of vitality in Roman architecture, Eastern influence became pronounced, especially during the 6th century. Southern Italy was linked not only with Rome but with the eastern and southern outposts of the Empire as well, the latter connection being most apparent in Sicily through its close relations with North Africa.

From the second half of the 3d century on, northern Italy gained steadily in importance. Milan, an imperial residence, became the leading cultural and artistic center for the whole of Italy during the 4th century of the Christian Era, to be supplanted in the 5th century by Ravenna. Ravenna was within easy distance of the outlying Aquileia, which in turn had ties with the territories of Istria and Dalmatia, where artistic influence from Asia Minor was strong, following upon the construction of Diocletian's Palace at Spalato. Northern Italy and the Adriatic areas as a unit can clearly be distinguished from central and southern Italy. Relations between upper Italy and the East, largely communicated through the Adriatic Sea, not only were intensive but were also more direct than anywhere else on the Italian peninsula.

Forms native to Asia Minor were widely adopted in these northerly sections, whereas Roman influence was proportionately weakened. In time, the architectural style of Constantinople became the principal influence, but not to the point of eliminating entirely those elements derived from Asia Minor and perhaps from Syria as well. Moreover, also common in upper Italy was an emphasis on verticality, a tendency reaching beyond to Gaul and Germany; its extent is demonstrated by the strong similarity of the so-called "Basilica" of Trier (Augusta Treverorum) to that of S. Simpliciano in Milan. As in earlier times, close relations must have continued to exist between Liguria and the province of Gallia Narbonensis, where the city of Arelate (Arles) had gradually risen in importance. Roman influence was also perceptible in 4th-century Arelate, as revealed for instance by the architectonic sculpture.

Late-antique architecture in Spain was of a marked provincial character. Along the southern shores of Iberia, there had long been contact with North Africa, where an indigenous style of architectonic sculpture generally impervious to outside influences developed. Among the regions of North Africa, the historical position of Mauretania and Numidia differed from that of Libya, where ties with Egypt were of long standing; Numidia, on the other hand, was oriented more toward the Italian peninsula, and Mauretania toward the Iberian.

In the East, the territories in which the older Oriental cultures still held sway stood in contrast to those dominated by Greek culture, subsequently reinforced by other Hellenist and Roman colonization. The term "East Roman" is most appropriately applied to the coast lands and their leading cities such as Ephesus, Antioch, and Alexandria, artistically in close contact with one another. The influence of the interior regions was another appreciable factor, producing great variety in the evolution of styles; the role of western Asia Minor was of particular significance, and not only in the late-antique period proper. The importance of this region had early been established, in the 3d century, through the productive schools of architectonic sculpture of Sidamara and of Aphrodisias, with influence that extended to Leptis Magna in Libya as well as to Rome and northern Italy. The increasing use of brick brought with it the development of true brick vaulting. The architectonic sculpture and the building technique of this region were to form one of the basic constituents in the architectural style of Constantinople, the new imperial seat, and thus during the 5th and 6th centuries assumed decisive importance for the entire late-antique world.

Elsewhere in the Near East, a rich architectural tradition is evident in Syria from the beginning of the imperial epoch, favored by the generally stable conditions that prevailed until the end of the late-antique period. This Syrian tradition was characterized by the use of a refined ashlar technique, inherited from Hellenistic times. From the 5th century on, in northern Syria there developed a tendency toward highly decorated exteriors, incorporating moldings, pilaster strips, pilasters, elaborate window and door frames, and engaged columns (e.g., apses of Qal'at Sim'ān, Qalb Lauzeh, and Basufan; PL. 47). In eastern Syria (the basalt region and the Hauran), there evolved another provincial strain, with pronounced Orientalizing tendencies especially in the architectural ornament. Even more strongly than at Palmyra, the distinctly Oriental forms of Parthian art appeared in the northern Mesopotamian city of Dura-Europos in the 3d century; geographically, however, the sphere of influence of this Orientalizing current seems to have been limited. The architecture of eastern Asia Minor and Armenia was closely related to north Syrian construction.

During the 4th century Palestine, in the south the gateway from the Near East to Egypt, acquired particular importance as a melting pot for diverse architectural styles. In large measure, this stemmed from the presence of many pilgrimage sites within its borders. Egyptian architecture underwent a separate development during the late-antique era; provincial in character, it exhibited a return to older Egyptian traditions and, in the architectonic sculpture, an increased stylization of the ornamental elements. Then, through Alexandrian architecture came the penetration first of East Roman influences and afterward of the style of Constantinople.

Very gradual in the beginning, the process leading toward development of a recognizable late-antique architecture, through a fusion of the varied traditions of Rome, Hellenistic culture, and the Near East, quickened after the middle of the 3d century. On the whole a process of internal development, it was little affected by outside contributions as it emerged, in essence a style clearly distinguishable from the individual preceding styles of antiquity.

Late-antique architecture was above all an architecture of interior space, concerned primarily with the organization and articulation of space rather than with the elaboration of individual members, which were progressively subordinated to over-all spatial and compositional aims. Elements that had been fundamentally structural therefore tended to acquire a more purely ornamental character, and sculpture and painting as such were relegated to an ancillary role in the total aspect of late-antique structures. Light as a factor in the architectural ensemble assumed new importance, as shown by the planned use of contrasts of light and shadow, of bright and dark tones. These qualities characteristic of late-antique architecture were

to reach a fully developed state in the monumental Christian structures erected after the conversion of Constantine.

Architectural elements. The simplification and gradual transformation of classical forms was a process already under way in pre-Constantinian times. Leading in this development was the art of the provinces, especially those of the Near East (Syria, Palestine, northern Arabia, central Asia Minor, and other regions). Similar tendencies were remarked in the West as well but, in all likelihood, were due in part to Eastern influence. An ornamental tradition specifically Hellenistic and Roman continued to dominate in imperial and other official architecture, particularly in western Asia Minor and also in Rome. In Constantinople, the 5th and 6th centuries witnessed an impressive development of ornamental sculpture; and in the regions farther east, the late-antique repertory of forms to some degree absorbed older Oriental Hellenistic idioms. The clear split between East and West in ornamental style became, despite repeated absorption of Eastern elements in the West, one of the salient features of late-antique art.

Although still treated with great naturalism before the middle of the 3d century in the works of the school of Aphrodisias (Asia Minor), the animal and vegetal forms constituting the vocabulary of ornament were elsewhere to be transformed through progressive denaturalization and schematization into stylized patterns, in which the real model was rendered all but unrecognizable. The acanthus became the basic and ubiquitous motif on capitals, impost blocks, cornices, and consoles — to such an extent that even the other vegetal ornaments tended to take on its appearance.

In this evolution, thus, the rendering of natural forms became more and more nonnaturalistic and moved toward abstract and pure geometric ornament. This kind of abstract decorative style — particularly diffused in the Near East (e.g., in eastern Syria), though it occurs in all parts of the late-antique world — frequently had a symbolic purpose as well. Ultimately, the fully developed ornamentation presented to the eye a unified surface in which background, blank space, and frame all became integral parts of the decorative scheme and were of equal value with the specifically ornamental elements. This typically late-antique phenomenon, first perceptible in pure form in western Asia Minor (related to the Sidamara sculpture) and in certain Syrian structures of the late 2d and the 3d century, achieved full expression in the openwork architectural decoration of the age of Justinian in Constantinople. The ornamental field here consisted entirely of a play of raised and depressed areas, of light and shadow (*Tiefendunkel*), the design having become fully abstracted from its natural model. In the 6th century this mature late-antique ornamentation was disseminated in all directions from Constantinople, and it exerted significant influence on the development of architectonic decoration especially in the Near East (Asia Minor, Syria, Armenia, Mesopotamia, and Egypt).

A peculiar phenomenon of late antiquity was that architectural elements such as bases, shafts, capitals, architraves, and decorated friezes were frequently removed from older buildings and reused for the same function in new constructions. Such reemployed parts were used both by themselves and in combination with elements made expressly for the building at hand. This somewhat puzzling practice may appear more understandable in the light of the fact that during the late-antique period many architectural elements, including entire columns with their bases and capitals, were mass-produced in standard sizes by specialized workshops and were thus interchangeable in various buildings. Among the most productive of such workshops were those of Constantinople and its surroundings (the Propontis), which manufactured building parts for export to virtually all lands around the Mediterranean and for all types of construction, private as well as official.

The most important of the individual architectural elements is the column. The Attic base, with square (and only rarely octagonal) plinth, at times raised on a pedestal, came into general use. A simplified version of the standard Ionic base is found only in rare instances. Individual parts of the column and base such as the shaft, fillet, torus, and echinus were simplified and no longer were distinctly separated from one another. Sporadically in the 4th and 5th centuries, but more frequently in the 6th century, a type of embossed base in which the neck molding and torus were replaced by a single flared tier was produced in workshops on Proconnesus and employed in Constantinople and Ephesus, in Greece, and in Ravenna and Salona (Dalmatia). Certain octagonal stepped bases of the 6th century found in S. Vitale in Ravenna appear to have retained little of the antecedent classical form.

A sizable proportion of column shafts were reused material. The late-antique shafts have no entasis; they are smooth-surfaced and only slightly tapered. The neck and foot normally have a smooth shaft ring without grooving. Great value was placed on luxurious quality and variety of materials for column shafts. In addition to marble quarried in Italy and Africa, stone from Greece and Asia Minor, such as the marble from Phrygian Synnada and the Propontic littoral and the green conglomerate of Thessaly, was in widespread use. Granite was less common, and porphyry was reserved for official constructions (e.g., Temple of Venus and Roma in Rome, Hagia Sophia and the Great Palace in Constantinople). In many provincial regions — among them, Dalmatia, Gaul, upper Italy, Spain, North Africa, Egypt, and Syria — local varieties of stone were employed in the carving of shafts. As early as the 4th century, shafts of variegated colors were combined within a single building scheme (Rome, S. Costanza). This practice had particular vogue during the 6th century, as perhaps best exemplified in Hagia Sophia.

Shafts that were fluted, twisted, or covered with ornament were chiefly used for decorative purposes in constructions such as ciboria and balustrades. Tendril-covered shafts were, however, frequently found even in monumental architecture during the 3d century. In place of columns, piers of square or rectangular section were also commonly employed; these were generally masonry constructions and only seldom monolithic units. Monolithic piers with engaged half columns on two faces served as supporting elements for windows in territories around the Aegean and were also exported to sites along the Adriatic. In central Asia Minor such compound supports were introduced into arcades.

Without doubt, the one element most subject to variation in design during the late-antique period was the capital. In the 3d and 4th centuries the continuity of imperial Roman and provincial types was maintained; the great break in the late-antique transformation of the capital did not become apparent until the 5th and 6th centuries. Ionic, Composite, but primarily Corinthian capitals were still in general use during the 4th and 5th centuries, the Eastern version of the Corinthian capital having been widely adopted and elaborated in the West (e.g., the compact calathus form, the closed garland, the short calyx and stem). In Rome and other western localities, however, Ionic, Corinthian, and Composite capitals representing a continuation or a revival of Western tradition were still to be found in the 4th century (Rome, S. Paolo fuori le Mura; Carthage); and in some provinces, capitals in prevailing use from the 3d to the 5th centuries reflected local traditional prototypes in their forms. The most important local schools developed in northern Syria, Egypt, North Africa, Dalmatia, and Rome itself.

In the late-antique evolution of the capital the general tendency was also toward simplification. The calathus, abacus, and other ornamentation were combined into single compact blocks. The introduction of the impost block, the one truly new element inserted in the Hellenistic-Roman system of support during late antiquity, constituted an important occurrence in the further development of the capital. The impost block was an additional supporting member inserted between the capital and the arch and, larger on its upper surface than on its lower, had trapezoidal faces. Appearing first in areas near the Aegean, including Constantinople, it became an indispensable feature of architecture there in the 5th and 6th centuries and afterward found its way to other provinces, especially in coastal regions such as those along the upper Adriatic. The front and side surfaces were frequently embellished with orna-

mental motifs, sometimes based on those of Corinthian and Composite capitals.

The impost block was in some types directly incorporated with the capital, and there arose toward the end of the 4th century the Ionic impost-capital, in which the abacus was organically joined to the inverted trapezoidal slab. This new type of capital came into widespread use in the Aegean area during the 5th and 6th centuries. At the end of the 5th or in the early years of the 6th century, in Constantinople, closer junction of impost block and capital produced the true impost-capital and its variations such as kettle, basket, fluted, trapezoidal, and border capitals. This marked the culmination of the development of the capital in late-antique architecture. The structure and decoration of these capitals, in which a compact mass was uniformly covered with an ornamental pattern, no longer owed anything to the tradition of the classical orders.

The importance of the impost-capital throughout the late-antique world was considerable. In addition to its regular use in Constantinople and its immediate sphere of influence, great numbers of such capitals were exported ready-made to many lands bordering the Mediterranean, where they exerted decisive influence on the architectonic sculpture of various coastal centers and the hinterlands (for instance, in Armenia, Mesopotamia, Syria, Palestine, and Egypt). In the Proconnesus workshops, in addition, capitals with figural motifs continued to be produced. These were principally carvings of the so-called "two-zone" type, with representations in the upper zone of birds and animal protomas (usually four in number) or, more rarely, capitals with impost blocks decorated with leaf masks, theater masks, or Medusa masks. The mask motifs were most likely intended for secular buildings, while others such as angels or Evangelist symbols were destined for religious structures.

The architrave, an architectural element encountered less frequently in the late-antique period than earlier times, still ordinarily had three flat fasciae, often embellished with a string-course, astragal, or a pearl band. Friezes were framed with various kinds of cymae, with acanthus and tendril ornament used in the more lavish constructions. The Lesbian cyma became increasingly rare and fell into disuse after the 6th century, whereupon the Ionic cyma was used exclusively. Pictorial friezes are known to have existed even in Christian buildings, as is shown by a frieze of lambs symbolizing the apostles, in the narthex of the Theodosian church of Hagia Sophia in Constantinople.

The architrave and frieze, however, were at times almost displaced by archivolts with elaborate soffits in the intrados and with fasciae and friezes on the face; yet, in other examples, these decorative elements were often worked out only in rudimentary form, and ornament was restricted to a simple frontal profile. A combination of architrave and archivolts appeared principally in propylaea with gabled pediments, where the central intercolumniation was surmounted by an arch and the four lateral ones by an architrave. The earliest examples of this type are generally attributed to Syria, although it is more probable that the idea originated in western Asia Minor toward the end of the 2d century. Major monuments in which such a combination occurred were the propylaea of Damascus, of Miletus, and of the Theodosian Hagia Sophia; another example is found in the mosaic representation of a palace façade in the Church of S. Apollinare Nuovo in Ravenna.

Cornices, often equipped with consoles, appeared as the crowning element both of the entire architectural system and of individual wall surfaces. Especially favored for the sloping sides of pediments, on the exterior these forms consisted predominantly of stuccoed or plastered masonry.

Classical orders (i.e., Ionic, Corinthian, and Composite) remained essentially unchanged only in the form of the capitals. Traditional usage of the orders was supplanted by a variety of canons strongly marked by regional peculiarities. Most frequently used was the Corinthian or the Composite order alone. Even when reused materials were involved, these orders were preferred over the Ionic and the extremely rare Doric (e.g., Rome, S. Pietro in Vincoli). Whereas uniformity of order tended to prevail within a single building, a group of structures was sometimes characterized by the use of varied orders, a device to separate clearly or give emphasis to individual parts of the complex. The choice of orders thus became a means of expressing spatial relationships in terms of correspondences and contrasts. In the mature phase of late-antique architecture, varying orders were employed even within the two rows of a single colonnade; however, the principle of the identity of parts centered upon a single axis was consistently observed. A particular canon was followed in East Roman structures with galleries, in which the Corinthian order was applied to the lower arcade level and the Ionic was used for the galleries above.

The colonnade and arcade became the most important elements of the interior space during late antiquity and served both in connecting and in separating the various components of the entire spatial complex. Arcading supported on columns or piers assumed other important functions in the triumphal arch, crossing arches, and transverse diaphragm arches. In vaulted structures of Constantinopolitan type, there developed an arcade system of alternate columns and piers, whereby in general the intermediate (gallery) level was supported on the columns, the roof vaults and the crossing arches beneath the dome rested on the piers. The round arch, generally somewhat elevated or stilted, was most widely employed, while the horseshoe arch was confined to a few regions such as central Asia Minor, northern Mesopotamia, and Spain. On the inside, the fusion of colonnade or arcade with wall surface, another characteristic development of late-antique architecture, made its appearance in the course of the 3d century of the Christian Era. This engagement of the columns or piers resulted in various combinations: piered arcade topped by a clerestory level (i.e., light source); colonnade with architrave and clerestory; and columned arcade with clerestory.

Wall articulation and decoration tended to be more developed in interiors than on the exterior. On the outside walls, the various levels were most frequently marked off by cornices; and in East Roman architecture an over-all horizontal articulation of wall surfaces predominated. In certain areas a "blind architecture" was the prevalent mode for exteriors, and the exterior walls were embellished by arrangements of pilaster strips, with or without horizontal subdivisions, or by blind arcades springing from pilasters or pilaster strips, as found about the clerestory openings and on the aisle walls of basilicas of the north Italian and Adriatic regions. Sometimes such blind arcades were elongated and embraced several stories without horizontal interruption, thus creating the strong sense of verticality that was to characterize Western architecture (Trier, the Constantinian "Basilica"; Milan, S. Simpliciano). Rich decoration of the outer walls — comprising cornices, pilasters, and strongly modeled window and door frames — prevailed in Syrian hewn-stone structures until the 7th century.

Brick buildings were generally plastered on the exterior during the late-antique era; also, in contrast to preceding periods, marble revetments were applied to exterior walls, though only in rare instances. The façades of the so-called "Temple of Minerva Medica" in Rome (PL. 37) and Hagia Sophia in Constantinople provide examples of this last practice, while the portal façade of the Roman villa at Casale, near Piazza Armerina, was painted in imitation of marble incrustation. Façades and pediments were also occasionally embellished with glass mosaics: Poreč (Parenzo), Yugoslavia, Cathedral; the Forum of Naples (cf. Procopius, *Bell. Goth.*, 5, 24, 82).

Interior wall surfaces were richly decorated and articulated, primarily according to Roman tradition. The wall was generally divided into horizontal zones, comprised of one or two lower bands, which served as a base, and an upper zone. The base portions of the wall in all monumental edifices were marble or polychrome stone revetments, while the upper zones were stuccoed or plastered. In religious and palace architecture this upper band was reserved for pictorial cycles, either painted or executed in mosaic. From the 3d century on, the latter technique enjoyed increasing popularity and became the preferred and characteristic decorative medium for walls in late-antique architecture.

Late in the century, from the period of the Tetrarchy, an extraordinary refinement was achieved in the technique of stone

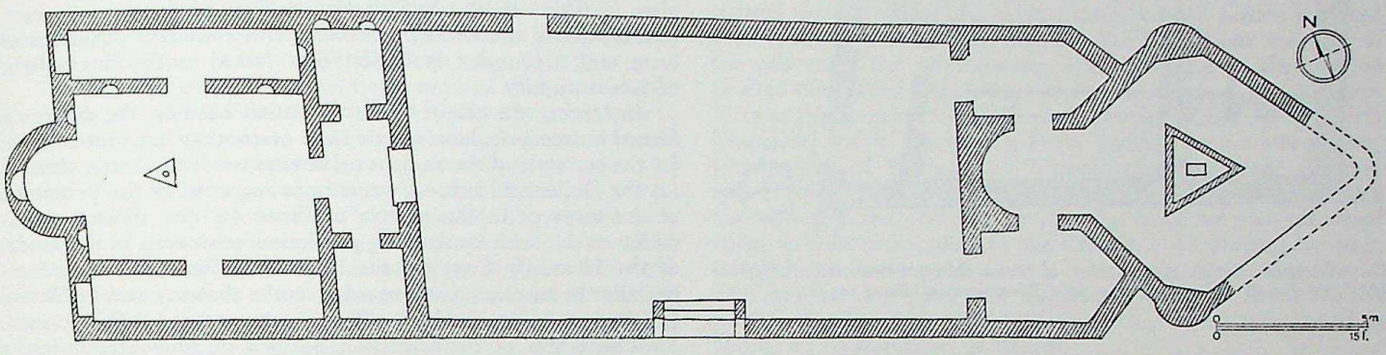
incrustation, employed in structures undertaken for the imperial court and later in church architecture. Buildings such as the "Temple of Minerva Medica" or the Basilica of Junius Bassus in Rome possessed not only incrusted wall decoration but also pictorial schemes in *opus sectile* (PL. 70; VIII, PL. 79). Examples of rich incrustation, with vegetal and geometric motifs, from the 5th and 6th centuries have survived in the Lateran Baptistery in Rome and in the 6th-century buildings of Constantinople, Ravenna, and Poreč (VIII, PL. 81). Inlay, stucco, and plaster were not confined to the interior walls of brick constructions, for those of hewn-stone structures in Syria and northern Mesopotamia were plastered and stuccoed; some luxurious buildings were even faced with colored stone, such as the churches of Rusafa and Qal'at Sim'ān. The Roman wall mosaic was also employed in the East, even beyond the boundaries of the Empire (e.g., Ctesiphon, the Ṭāq-i-Kisrā complex). The interior wall might also be articulated with blind arcades and half columns, and with blind arches or aediculae around the windows. The strong — and at least seemingly structural — relief thus given to the wall surfaces was particularly in evidence in such 4th-century edifices as the Mausoleum of Diocletian in Spalato and the Temple of Venus and Roma (as rebuilt by Maxentius) in Rome, as well as in the 5th-century S. Maria Maggiore (PL. 40) and the Baptistery of the Orthodox in Ravenna (PL. 45). Having the appearance of rectilinear paneling, the 6th-century wall incrustation of Hagia Sophia in Constantinople, on the other hand, served more to hide the system of support than to give it visual expression.

While most doors had rectilinear lintels, windows were chiefly roundheaded, a form analogous to the arcades that was almost uniformly adopted in monumental architecture in the 5th and 6th centuries. Rectangular openings, nearly always of small dimensions, usually served particular purposes (e.g., the slit windows found in staircases and funeral structures) but were also the characteristic wall openings of the architecture of individual provinces such as Egypt. In Syria, the rectangular window was commonly employed in the 4th century but was replaced in the 5th by the roundheaded type. As a rule, doors and windows were set into the walls singly; however, paired windows occurred with some frequency, and even whole window arcades were known, with shutters or screens installed between columns or monolithic piers. In the same way, doors were installed within colonnades, the successive arch openings being closed either entirely by means of stone slabs or only partially by gates or screens. Screens of this kind existed in the Lateran Baptistery, and probably in the narthexes of the churches of SS. Giovanni e Paolo, S. Clemente, S. Maria Maggiore, and S. Pietro in Vincoli, all in Rome. In the narthex of the baptistery of Hagia Sophia, the doorposts and accompanying column shafts were carved in a single piece.

In vaulted buildings, the lunettes under barrel vaults were occasionally pierced to serve as windows, and a substantial amount of light was thereby admitted to the vaulting level. Such a system of fenestration, which was elaborated in the great thermae of the 3d and early 4th centuries, had its most notable application in Hagia Sophia (I, PLS. 378, 379). These apertures were closed with latticework or pierced screens (transennae) fitted with glass. Such transennae were made of wood, stucco, stone (marble), or bronze, and employed numerous ornamental patterns composed of squares, rhomboids, circles, or varied combinations of basic geometric shapes, as well as scalelike and star motifs. For large openings reaching to ground level, as found in Hagia Sophia, the window area was usually subdivided vertically by piers and horizontally by lintels, and grilles were inserted. Monumental structures were generally provided with solid double doors, often of wood; those of the Church of S. Sabina in Rome have been preserved. Continuing the antique traditions, there were also doors of gilded bronze, such as those of the 4th-century vestibule of the Temple of Romulus in the Forum Romanum (PL. 41), of the Lateran Baptistery, and of Hagia Sophia. Doorways were usually given further prominence through high-relief jambs and lintels; in the decoration of brick buildings, costly materials (especially marble) were employed for such purposes.

The various types of pavement known in Roman architecture continued in use during the late-antique period. There were simple pavements, inlays of *opus signinum* and *opus sectile* (geometric patterns made by piecing together varied fragments of marble), and above all the mosaic proper, predominantly with stone tesserae but occasionally in glass. Mosaic pavements enjoyed great vogue during late antiquity, and excavations have brought to light numerous examples of the technique. Moreover, mosaic and *opus sectile* were sometimes combined within the same pavement (Ravenna, S. Vitale).

All the types of roofing forms and construction current in late antiquity may be traced back to earlier periods. In buildings with sloping wooden roofs, crossbeams and trusswork might be left exposed in the interior, but they were perhaps painted and even gilded. The beams were sometimes decorated with coffers or lacunars (*laquearia*). Often a flat ceiling of wood (*contignatio*) or of plastered canework (*camerae canitiae*, *camera cannae*) was inserted. Flat wooden ceilings with undersupports were also employed between stories and for false (inserted) floors; these were decorated on the underside with coffers, either given a strong relief effect by means of wood or stucco construction or merely suggested through painting. A particular form of the flat coffered ceiling, consisting of a wooden grid holding coffers constructed with painted bricks, has been found in the Synagogue of Dura-Europos; and coffered ceilings wholly of marble still existed in the 3d century. Flat ceilings composed of stone slabs or beams were a standard type in Syria (Hauran, Qalb Lauzeh), following an old tradition.



As it had in Roman architecture in general, vaulting continued to play a role of capital importance. Because of the preeminence of Constantinopolitan architecture, brick vaulting, originally developed in western Asia Minor, appeared in the farthest reaches of the Empire. In Rome, however, from the 3d century vaults were constructed in *opus caementicium*, usually reinforced by brick ribs. At the end of the century, lighter vaults were achieved through the introduction of large clay vases into the structural fabric. Known in Numidia and Sicily earlier in the the 3d century, the technique of vaulting involving the use of clay vessels set end to end — thereby avoiding the need for outer scaffolding during construction — came increasingly into vogue in the West, beginning with the 4th century, for the erection of all types of vaults and especially of domes.

Apart from the dome rising directly from a round drum or octagonal base and the domelike raised crossing vault set on a square, which were forms previously known, the dome on squinches and the dome on true pendentives, both resting on square podia, constitute the late-antique contributions to and customary types of domical construction. While the earlier of these types had probably originated in Sassanid Persia (palaces of Sarvistan and Firuzabad), though widely diffused in the West as well (Naples, Cathedral Baptistery; Vicenza, S. Maria Mater Domini), the latter forms were undoubtedly the great original developments of late-antique architecture. The dome on pendentives in all likelihood made its appearance first in East Roman territories of the Aegean region, although the oldest preserved example is found in the shrine of St. Mennas near Alexandria, dating from the beginning of the 5th century. The imposing second dome of Hagia Sophia in Constantinople, from the Justinianic epoch, marks the culmination of this mode of construction (II, PLS. 427, 428). Moreover, it is the first example in late-antique architecture of a dome in which a distinction between load-bearing and covering functions was achieved through the use of ribs. In the decoration of the underside of the vaults, the formerly standard coffers became rarer (though a coffered vault existed in the narthex of the first Hagia Sophia, erected in the reign of Theodosius). Increasingly, vault decoration was executed in glass mosaic, and to a lesser extent with painting and stuccowork, which nevertheless remained in use until the 6th century.

The principal Hellenistic and Roman types of roofing were maintained by late-antique architects. Following long-standing Near Eastern tradition, however, flat roofs were constructed in parts of Syria and Egypt, not only in domestic architecture but also on a larger scale in public buildings. With stone or brick

masonry the shed (pent) roof was used for the special purposes of porticoes and side aisles; but as may be inferred from the existence of so many gabled frontals, the span roof was the most widely employed type of sloping roof. In public buildings, the hip roof was also adopted. In wooden constructions, the triangular trussed roof developed by the Romans was virtually the only type in use. Conical, pyramidal, and tent roofs were constructed not only in wood but also in stone, as practiced in Syrian funerary buildings. Similar constructions were also erected over domes, especially those built of lighter materials; a drum ringing the circumference of the dome removed from it the added weight of the roofing.

For the most part, roofs were covered with clay tiles (*tegulae et imbrices*). In vaulted buildings, the tiles were generally laid directly on the surface of vaults or over the surface covering them. Marble or bronze tiling, the latter sometimes gilded, was customary in more important edifices; lead tiles were in more ordinary use for vault covering.

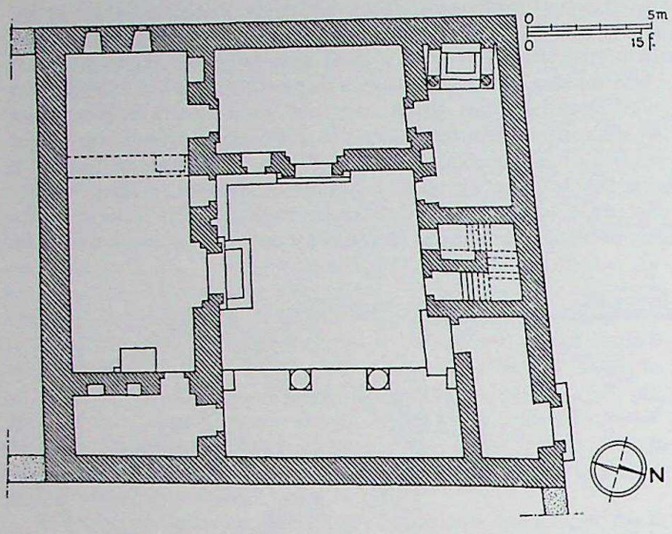
Rome, mystery sanctuary of the Syrian gods, on the Janiculum, plan of the 4th-century structure (*from B. M. Felletti Mai, BCom, LXXV, 1953–55, p. 137*)

The temple roof richly decorated with acroteria and antefixes was to find only a modest echo in the Christian church of late antiquity. The cross replaced the central acroteria at the summit of pediments and pitched roofs, while funerary buildings were occasionally adorned with appropriate symbols such as the pine cone.

Interior layout. In both religious and secular structures, the late-antique preference was for spatial arrangements in which individual rooms or spaces were not functionally combined with each other but were subordinated to geometric schemes laid out along horizontal and vertical axes. The Roman system of axial symmetry in layout was further elaborated, and the development of the centralized plan may be cited as a characteristic example of this taste. The central-plan buildings of the 3d century consisted of a single spatial unit, either round or polygonal and sometimes surrounded on the exterior by a portico. The Constantinian period, however, saw the advent of centralized structures with single or double ambulatories, a new form that was to have broad application in the following centuries. Such enlargement and elaboration of space led gradually to the interpenetration of individual units, in particular through the addition of niches to the central core and the alternation of concentric forms such as squares, circles, and polygons.

In longitudinal buildings, the principal type of spatial arrangement was the basilican plan. In such structures, involving a larger basic unit with subordinate elements attached, the transverse axis often constituted a secondary base for organization of the spatial elements; thus, the basilica with transept was gradually developed. By making the arms of the crossing equal in value with the bisected nave, late-antique architects created a new variation of the centralized plan, the Greek cross, which was to play a significant role in the subsequent history of architecture. Besides the simple square crossing, there appeared — though more infrequently — round or polygonal central elements (e.g., Qal'at Sim'ān). The cruciform central plan was further elaborated through the imposition of circular or polygonal elements upon the basic cross. In the 6th century, the high point in the development of this form, the interior disposition of space was visible on the exterior only at roof level, for the lower parts formed a closed, tightly knit unit. It should be noted that, despite the equal emphasis given to the two main axes, central-plan buildings wholly nonoriented in direction within were rare.

Development of the religious sanctuary. a. Pagan. Construction of pagan religious shrines, which had declined sharply by the beginning of the 4th century, disappeared altogether at the end of the century. The typical temple dedicated to the cult of official deities continued to adhere to the Hellenistic-Roman tradition during the 3d century and even at the beginning of the 4th century (as shown by the 4th-century rebuilding of the Temple of Venus and Roma in Rome, a podium temple with peristyle, and the Temple of Jupiter in Spalato, with prostyle). The cellae, however, were generally vaulted. The Temple of the Sun built by Aurelian in Rome may have been circular in plan.



Far more important, until well into the 4th century, were the official sanctuaries of the Oriental mystery cults, such as those of Isis, Jupiter Dolichenus, and especially Mithras, which were spread out over the entire late Empire. In addition to the predominant single-aisled type, there also existed Mithraea with a three-aisled division of the space, for example, the Mithraeum of the Baths of Caracalla in Rome and the Mithraeum in Dura-Europos. The 4th-century mystery sanctuary of the Syrian gods on the Janiculum in Rome had two cult chambers placed on opposite sides of a courtyard: one a tripartite longitudinal structure, the other a polygonal central-plan construction (FIG. 77). Such a spatial disposition is similar to certain arrangements of Christian architecture. Nothing has been preserved of the sanctuaries of the Manichaean cult, which existed in all large cities; and the development of the Persian fire temple of the Sassanian period lies outside the compass of the late-antique period.

b. Jewish. For a discussion of late-antique synagogues, see the article JEWISH ART.

c. Christian. Early Christian architecture lent a distinctive aspect to the entire late-antique period, notable not only because of its wide diffusion but also for the significance these structures were to have as the basis of medieval church architecture in both West and East, including the Slavic countries. Little is known concerning forms of church construction in the period before the reign of Constantine. The *domus ecclesiae*, or "house church," in Dura-Europos (second quarter of 3d cent.; FIG. 79) consisted of a chamber for worship, improvised by combining two small rooms in a residential building with courtyard, and an adjoining room that served as a baptistery. The house church at Qirk Bize in northern Syria, probably dating from the beginning of the 4th century, does not differ from the typical farmhouse of this region and focuses upon a room two stories in height that served as the church. It is clear that the prototype of later churches cannot be identified with structures such as these; the monumental churches erected during and after the Constantinian period — in some instances,

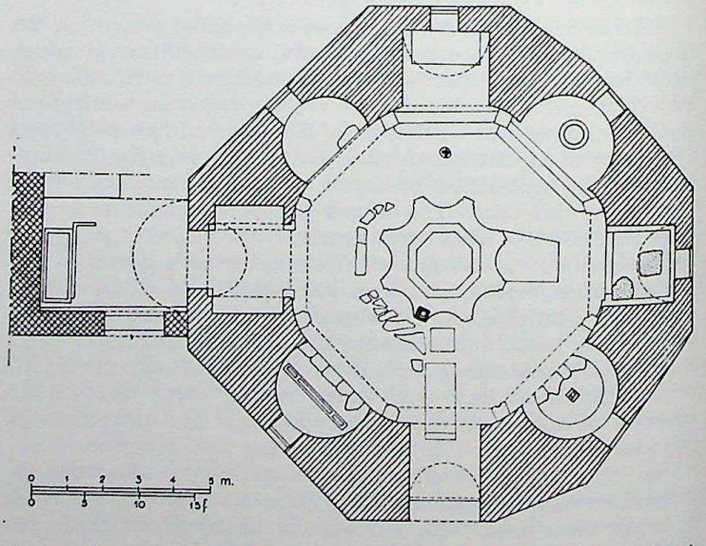
under the direct patronage of the emperor — were based stylistically on the tradition of official secular architecture, not on domestic architecture or the pre-Constantinian house churches, which merely contributed functional (i.e., ritual) schemata.

Until well into the 4th century, diocesan and parish churches, to which a separate baptistery was more or less closely linked, constituted the prime concern of Christian architecture. From

Dura-Europos (Syria), ground plan of house church (*domus ecclesiae*) (*from U. Monneret de Villard, Chiese della Mesopotamia, Rome, 1940*).

the Constantinian period on, the commemorative church, erected on sacred sites or in memory of martyrs, assumed major significance. In the 5th century and thereafter, especially in eastern parts of the Empire such as Egypt, Syria, and Palestine, the monastic church gained steadily in importance. Depending on the specific religious purpose, many variations of central and longitudinal plans were adopted. Chapels, oratories, and mausoleums, frequently constructed by private individuals, were sometimes annexed to the churches, but isolated and freestanding structures of these types were also built.

The plan of the Early Christian church in general consisted of the following elements. Preceding the church proper was an atrium, narthex, portico, or merely portals, usually on the western side, although in Rome these could be located on the eastern side and in northern Syria on the southern side of the main body. Access was thus gained to the main structure, housing the congregation and a sanctuary with the altar and space for the clergy. The bishop's throne, surrounded by the bench (*subsellium*) of the presbyters, was generally located in the apse, behind the altar and facing the nave. The apse, especially in the eastern provinces, was flanked by side chambers, the so-called "pastophoria," designated as prothesis and diaconicon but occasionally adapted to serve as a baptistery. In northern Syria the chamber of the southern side of the apse was used, almost without exception after the early 5th century, as a martyr's chapel, where sarcophagi with venerated relics were kept.



Baptisteries did not conform to any single type of plan. In some instances, a room at the front or to the side of the church (*consignatorium*) was used in preparation for the ceremony. The baptistery itself might consist of a central-plan structure with a baptismal font in the middle; or a font might simply be located within the church proper, in the apse, which as an alternative might be depressed to serve as a piscina itself, as was notably the case in the Syrian apse baptisteries.

The arrangement of commemorative churches and martyriums, which followed the same general lines as parish churches, was not uniform and changed in the course of time in response to the significant growth of the cult of martyrs. In Constantinian times there were two kinds of commemorative churches: the structure housing at its center some venerated site, and that located in the vicinity of such sacred sites. The first type was represented by the holy places in Palestine and by St. Peter's in Rome, and the second particularly by the Roman funerary basilicas near the tombs of the Early Christian martyrs and sites honoring the apostles along the Via Appia. In none of the Constantinian martyriums did the altar stand immediately over the venerated spot, for the direct association of altar and tomb had not yet arisen. As late as the 5th century, in the majority of commemorative churches the altar stood in front or to the side of, but not actually on, the honored site, as in the apsidal mausoleum of St. Anastasius at Marusinac, near Solin (Salona) in Dalmatia. The altar tomb did not become an obligatory form until the 6th century. Soon thereafter, during the reign of Gregory the Great (ca. 600), the sanctuary of St. Peter's in Rome was reconstructed and the altar installed directly above the tomb of the martyred first Pope.

The two fundamental spatial layouts for church structures were the central and the longitudinal plans, employed concurrently as early as the Constantinian period. The longitudinal plan, of which the Early Christian basilica was the most recurrent type, had the widest diffusion, with elaborate variations of form and a complex evolution that lasted until the twilight of late antiquity.

In tracing the origin of the Christian basilica, the following formal antecedents have at one time or another been mentioned: (1) the peristyle of the ancient private house or the house church; (2) the Hellenistic heroon, sometimes regarded as the prototype of the transept in the martyr basilicas; (3) the ancient colonnaded street, with its flanking porticoes considered as the model of the Heavenly City; (4) the imperial palace-basilica and especially the throne room, regarded as the throne room of Christ; (5) the public or secular basilica, such as the *basilica forensis*.

The origin of the Christian basilica is, however, purely a problem of form, not one of function; thus some of the foregoing hypotheses are from the outset based on false premises. The plan of the Christian basilica was undoubtedly derived from the numerous basilican halls of secular architecture, the most representative variety of which was the *basilica forensis*. Whereas the latter form was generally marked by an emphasis on width, the Christian basilica was characterized by a longitudinal axis focusing on the sanctuary. The adaptation of an

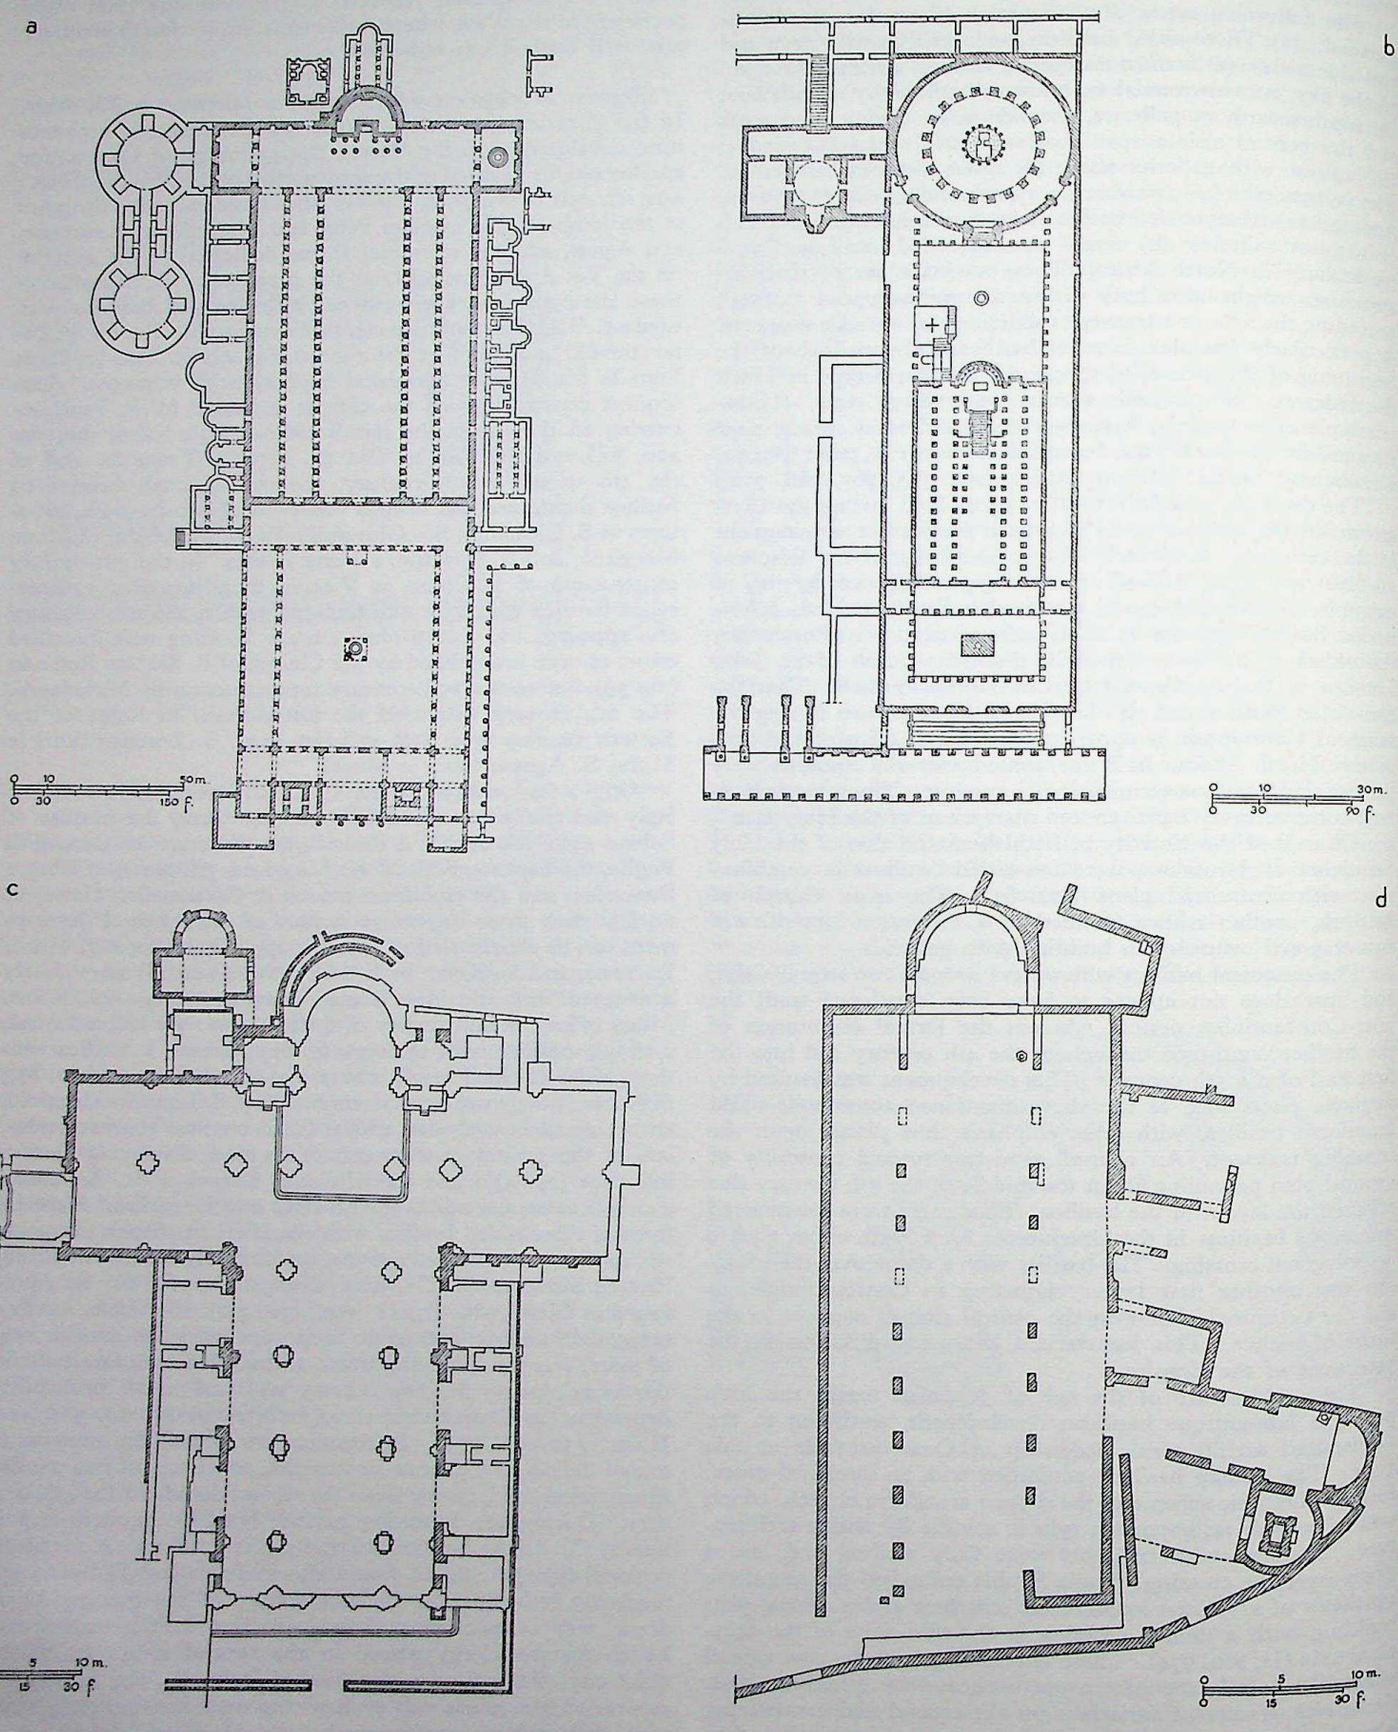
Albenga (Liguria), Baptistery (5th cent.), plan (*from G. De Angelis, I Battisteri d'Albenga e di Ventimiglia, Alassio, 1936*).

existing type of structure for an entirely new purpose therefore resulted in a decided spatial change, which makes it useless to seek definite antecedents in diverse earlier types, even though this new orientation of space is of course inexplicable without reference to preceding formal developments. The transformation of Christianity from a private, even secret, religious community in pre-Constantinian times to an official state religion

during the reign of Constantine constitutes the decisive event, the factor motivating the change from a small-scaled to a monumental architecture.

The following types of Christian basilicas can be distinguished: (1) Three-aisled basilicas, such as that with nave and two side aisles: (a) *basilica discoperta*, with its central aisle open to the sky, a controversial type not recognized by all scholars; (b) basilica without galleries, the side aisles having shed roofs and the central aisle a span roof set above a clerestory zone; (c) basilica with galleries above the aisles reserved for women, that is, gynaecea (γυναικωνῖτις), a type found chiefly around the Aegean. (2) Many-aisled basilicas: (*a*) five-aisled basilicas, with or without galleries; (b) seven- or nine-aisled basilicas, found particularly in North Africa. These varied types of basilican structures might also have either an uninterrupted transept preceding the apse or a transept subdivided by the aisle supports. A particularly complex form of basilica, developed about the beginning of the 5th century, was the cruciform type in which the aisles run continuously around the transept arms. (Latin-cross plan: St. John's, Ephesus; the St. Mennas shrine, near Alexandria; St. Demetrius, Salonika. Greek-cross plan: Thasos, Gerasa, and Salona. Cf. FIG. 86; II, FIGS. 763, 765, 766, 772.)

The diversity of architectural types evolved during the Constantinian period provided a rich basis for further development in the centuries thereafter. The undertakings of the Emperor and his retinue undoubtedly exerted great influence; by way of example, it was in imperial circles that the five-aisled, colonnaded basilica appears to have been adopted for church use, the oldest of this type being the diocesan church of St. John Lateran in Rome, founded by Constantine himself. That the five-aisled basilica was also known in the provinces during the reign of Constantine is apparent from the basilica of Orléansville in North Africa. In Rome, some cemeterial churches were three-aisled basilicas terminating in exedrae. The most important commemorative church and martyrium of the Holy Land, the Church of the Nativity in Bethlehem and that of the Holy Sepulcher in Jerusalem, were five-aisled basilicas in combination with centralized plans (FIG. 83). The main church of Antioch, another edifice founded by Constantine himself, was an octagonal central-plan building with galleries.



The canonical basilica with a nave proper, two lateral aisles, and apse does not appear to have been developed until the post-Constantinian period, wherein the formal elaboration of the basilica continued throughout the 4th century and into the first half of the 5th century. This development was marked by intricate plans such as the above-mentioned continuous-aisled cruciform basilica, with great emphasis thus placed upon the complex transept. An over-all tendency toward centrality of ground plan prevailing about the middle of the 5th century also affected the layout of the basilica. Thus there were constructed numerous basilicas in the Greek-cross form, with either square or polygonal crossing. The basilica with a dome over the crossing was another new type, originating in Constantinople, as did the octagonal plan with the central ring of support in the form of niches. This last variant had wide diffusion in the provinces of the Empire.

The architecture of the age of Justinian marks the high point in late-antique basilican development, testifying to the undisputed architectural leadership of Constantinople at this time. The oblong basilica, combined with an inscribed cross, formed the basic scheme of the domed cruciform church, which was to become an important type in middle Byzantine architecture. Basilicas with transepts were fully vaulted and had a dome over the crossing. Hagia Sophia embodied the grandiose synthesis of a vaulted longitudinal structure and a central-plan building with a domed crossing at the mid-point of the principal axis (II, FIG. 774). These developments in the new capital affected primarily the eastern provinces and furnished the basis for a rich stream of variations on the central and centralizing plans. However, the older types — among them, the plain three-aisled basilica and the standard basilica with transept, as well as the simple central-plan structure — continued in use everywhere, though especially in provincial centers, side by side with the new variations of Constantinopolitan architecture. This continuity of older types was observed in the East and remained a vital aspect of religious architecture in Byzantium until the Islamic conquest; such recourse to tradition was even more persistent in the West, where it was apparent in church architecture well beyond late antiquity.

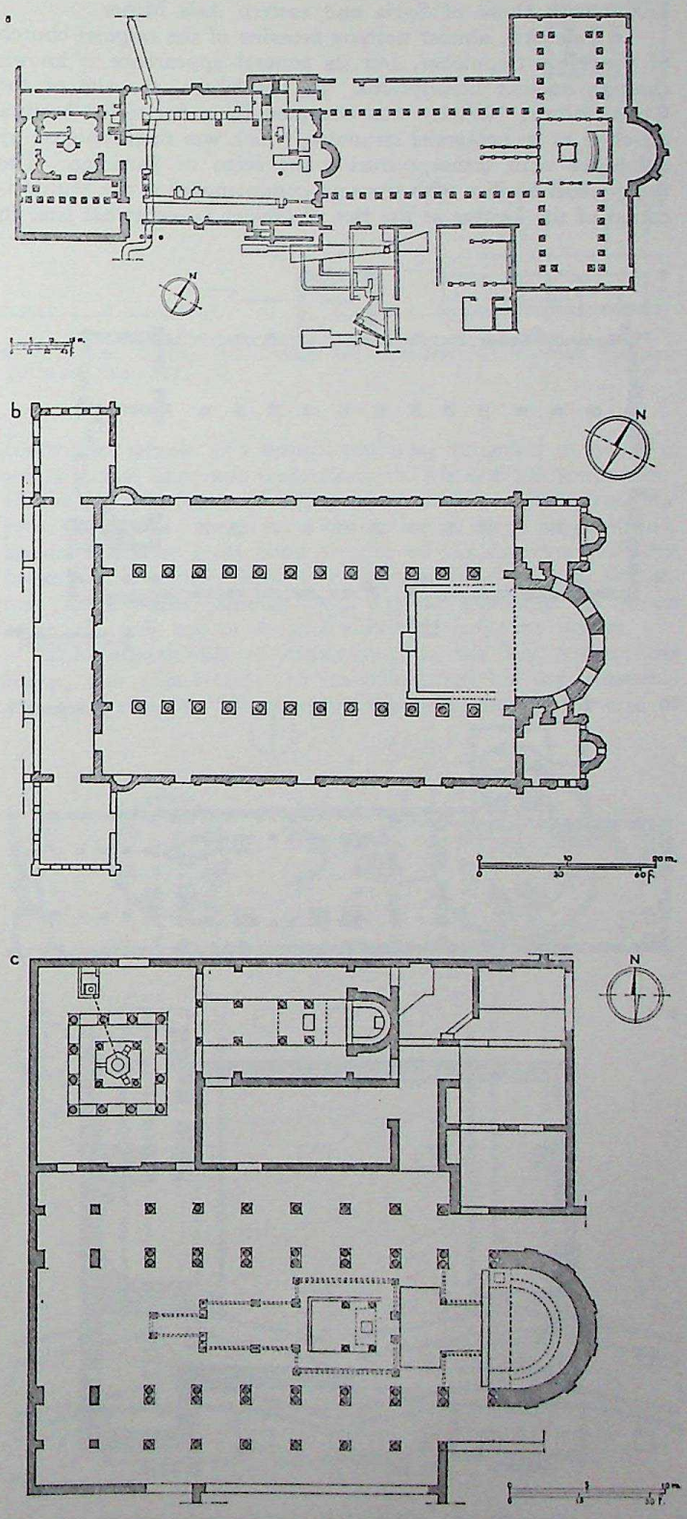
Regional development of late-antique architecture. a. The West. In the Constantinian period, Rome was the center of architectural development in the West. The patronage of Constantine and his retinue resulted in the construction of the five-aisled diocesan church of St. John Lateran, the commemorative churches at the tombs of the martyrs Peter and Marcellinus, Lawrence, and Agnes, and the memorial shrine dedicated to the apostles on the Via Appia (probably at the present-day S. Sebastiano); these last-named memorials were all three-aisled basilicas with exedrae. The Constantinian commemorative churches for St. Peter (the old basilica of St. Peter's; FIG. 83) and St. Paul (S. Paolo fuori le Mura) were five-aisled basilicas with transepts. Subsequent construction on the church dedicated to St. Paul, occurring on the site of the saint's tomb a little before the year 400, followed the plan of Old St. Peter's. From the end of the 4th until the 6th century, the conventional three-aisled basilica dominated the Roman scene, as shown by such structures as S. Clemente, SS. Giovanni e Paolo, S. Sabina, S. Maria Maggiore, and S. Giovanni a Porta Latina. In the 5th-century construction of S. Pietro in Vincoli, there appeared a three-aisled basilica with tripartite transept, and in the same century also appeared the central-plan, circular building with inscribed cross, as once exemplified by the Church of S. Stefano Rotondo (PL. 39), before the 15th-century reconstruction by Nicholas V. The 6th century witnessed the introduction to Rome of the Eastern basilica type with galleries (e.g., S. Lorenzo fuori le Mura, S. Agnese fuori le Mura).

Only a few scattered Early Christian structures in southern Italy and Sicily can be cited — among them, the basilica of Salemi (4th–5th cent.), a central-plan structure in Canosa di Puglia, the baptistery (S. Maria Maggiore, 5th cent?) of Nocera Superiore, and the cruciform church of Casaranello. However, no less than three important centers of architectural development can be clearly distinguished in upper Italy: namely, Milan, Ravenna, and Aquileia. Stylistically, these were all more closely connected with the East Roman provinces than with Rome. Milan offered a rich variety of formal types: the old cathedral, a simple basilica with transept; S. Simpliciano, a basilica with three aisles of equal height and a two-aisled transept (FIG. 83); S. Nazaro Maggiore, a cruciform building; S. Lorenzo Maggiore, an octagonal central-plan edifice lobed on four alternate sides, one of the greatest monuments of its kind, displaying Eastern influence (PL. 43); and the adjoining Chapel of St. Aquilinus, a simple octagonal building with eight interior niches. A special form of three-aisled basilica with chambers or chapels alongside the apse was favored in Ravenna, undoubtedly because of strong Eastern influence (S. Giovanni Evangelista, FIG. 86; S. Apollinare in Classe, FIG. 87; II, PLS. 430, 431). S. Vitale, another octagonal building, with eight niches spanning the interior ring of piers, was the most important central-plan structure built in the West during the 6th century and was in all probability dependent on Constantinopolitan architecture (I, PLS. 384, 411; II, PL. 430, FIG. 775). In Aquileia are located the remains of one of the oldest Christian sanctuaries, consisting of two parallel three-aisled halls, dating from the second decade of the 4th century. During the following period, both in Aquileia and in nearby Grado the basilica was the preferred form. A particular regional type of church, found also in Istria and Dalmatia and markedly influential in the architecture of the eastern Alpine areas, was a structure without apse but with a semicircular bench for the clergy placed in the central aisle. In Salona, chief city of the Roman province of Dalmatia, the *basilica discoperta* of Marusinac was perhaps the most notable early structure, followed in importance by the cruciform church of the 6th century and the 4th-century *basilica urbana*, which reveals a connection with the East.

The northern territories, from the Danube and the Rhine to northern Gaul, were characterized by very simple structures

Plans of basilican complexes of the 4th century, partly reconstructed: (*a*) Rome, St. Peter's; (*b*) Jerusalem, Church of the Holy Sepulcher (cross indicates the location of Calvary); (*c*) Milan, S. Simpliciano; (*d*) Bône (Hippo), Algeria, the Great Basilica.

that consisted of modest-scaled rectangular halls, often without apse. In strongly Romanized centers, nonetheless, the architectural types of the Mediterranean littoral were present, such as at Trier, with its cathedral complex composed of two three-aisled basilicas of the 4th century. St. Gereon in Cologne, with an elliptical interior ringed by eight niches, dates from the second half of the 4th century and may reflect a Roman prototype. It may be assumed that in other leading Roman cities of Gaul, buildings of Mediterranean Roman character were also present, although no examples have been preserved.

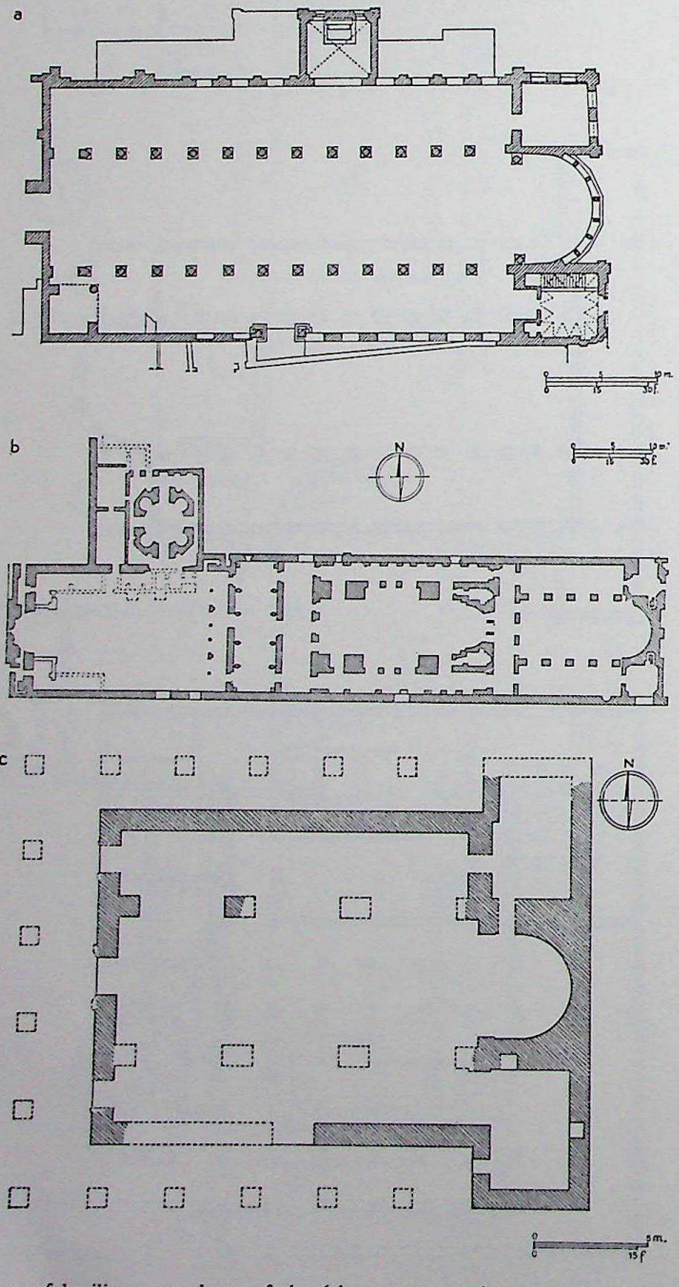


North Africa, especially Numidia (Tunisia) and western Mauretania (Algeria), was one of the most important regions for the development of late-antique architecture. The local variant of the three-aisled basilica was the commonly favored monumental type. From the Constantinian period, to a lesser extent, there were also some basilicas of five (Orléansville) to nine aisles (Damus el-Karita in Carthage; Tipasa). Further distinctive details of North African architecture were coupled supports (either columns or piers with columns) and double apses, often elevated above the pavement level of the aisles.

Spain, where the three-aisled basilican type can also be traced, was undoubtedly influenced by the western sectors of North Africa. Architecture in western Libya (Tripolitania) was closely connected with the Numidian style, whereas that of the Cyrenaic region tended to follow Egypt, in accordance with ancient tradition.

b. The East. Constantinople became the foremost architectural center of the Eastern Empire with the construction of a number of monumental religious edifices after A.D. 330, begun under the auspices of the emperor Constantine and completed by his successor Constantius. None of these has survived to the present day. The oldest surviving construction, dating from the end of the 4th century, is the lower story of the martyrium dedicated to SS. Karpos and Papylos, a round domed building with ambulatory and apse. The façade of the first Hagia Sophia, as rebuilt by Theodosius II, dates from the early 5th century. It consisted of a pedimented propylaeum (excavated by Schneider in front of the present-day façade) flanked by porticoes, with sculptural decoration that was the basis of a subsequent line of stylistic development (II, PL. 429). The Church of St. John in Studion (ca. 463) is the earliest remaining example of the canonical three-aisled East Roman basilica, with galleries and the rounded apse with polygonal exterior that was characteristic of Constantinople and later widely adopted (II, PL. 423; FIG. 762). The age of Justinian marked the culmination in the development of Constantinopolitan architecture and architectonic decoration. The most significant buildings preserved from this period are SS. Sergius and Bacchus (II, PL. 426, FIGS. 770, 771), St. Irene (II, PL. 433, FIG. 774; VII, PL. 408), and the most notable, Hagia Sophia.

Closely connected with the capital in architectural style were the regions around the Aegean and the bordering Balkan territories. In Greece often furnished with transept and crossing, the three-aisled basilica constituted the most common type in these areas. As in Constantinople, such structures usually had the galleries reserved for women. The most important structures extant in these regions are the Church of St. Demetrius in Salonika (II, FIG. 763), a five-aisled basilica with transept; St. John in Ephesus, a three-aisled basilica, cruciform and domed as reconstructed under Justinian (II, FIG. 772); and central-plan structures in Hierapolis and Thasos, similar to the cruciform basilicas of Gerasa and Salona.

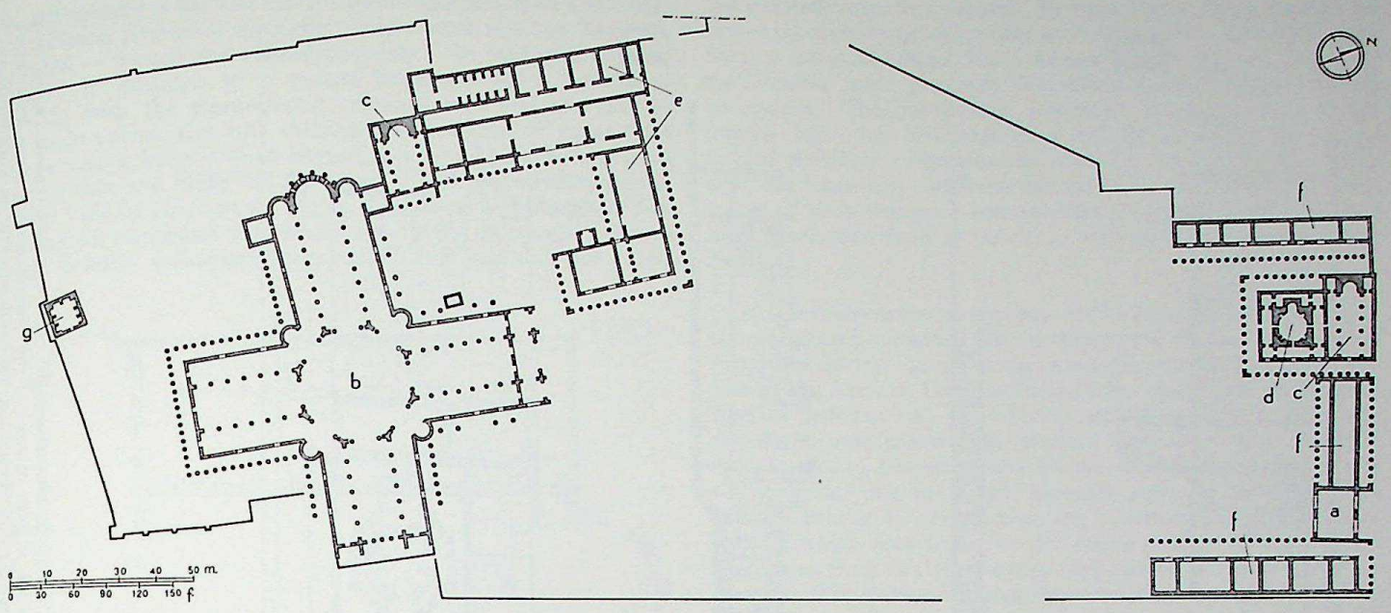


In central Asia Minor basilican structures were not unknown, but single-aisled cruciform buildings, frequently with domed crossings, were the characteristic type of the region. Farther south, especially in Cilicia, the basilican plan was the more prevalent. In Syria numerous structures have been well preserved, primarily in open country but sometimes as part of ancient settlements; thus, the late-antique evolution of the architecture of this region can be clearly traced. In the metropolis of Antioch, where an octagonal building with an ambulatory surmounted by galleries is known to have been constructed in the reign of Constantine, St. Babilas is the only example of the single-aisled cruciform structure preserved (II, FIG. 764). The areas around Antioch and Apamea, the basalt region to the east, and the Hauran in the south were the chief architectural subdivisions of Syria. The greatest number of churches were three-aisled basilicas with tripartite sanctuary. In the Hauran, where local tradition favored simple hall-type structures, the basilica did not appear until the late 5th century. The most significant central-plan structures in Syria were the cruciform pilgrimage church of St. Simeon Stylites at Qal'at Sim'ān (PL. 47; FIG. 89); the so-called "martyrium" at Seleucia Pieria (mod. Süveydiye,

Plans of basilican complexes of the 5th century, partly reconstructed: (*a*) St. Mennas, near Alexandria (Egypt), reign of Arcadius (395–408); (*b*) Ravenna, S. Giovanni Evangelista, reign of Galla Placidia (425–50); (*c*) Carthage, Basilica of Douimes (late 5th cent.).

Turkey), similar in plan to the Cathedral of Bosra; and the Church of St. George in Zorava (mod. Ezraa). The churches of northern Mesopotamia are clearly related to Syrian types, and the so-called "martyrium" (probably the diocesan church) of the important complex of Rusafa-Sergiopolis (FIG. 87) is stylistically very much like the group of central-plan Syrian structures just mentioned. Central-plan buildings in Maiyafarikin and Amida (mod. Diryarbekir, Turkey), on the other hand, reflect the influence of Constantinople; whereas the extramural cemetery church of Rusafa may perhaps have been related to Sassanian architecture. The Armenian churches can also be linked with those of Syria and eastern Asia Minor.

In Palestine, almost nothing remains of the original church of the Holy Sepulcher, but its general appearance is known through ancient descriptions. In Bethlehem, the site of the Grotto of the Nativity was occupied by a five-aisled basilica attached to an octagonal structure, which was then replaced by a basilica with transept during the reign of Justinian. The three-aisled basilica with transept commemorating the Multiplication of the Loaves at the Sea of Galilee is somewhat later in



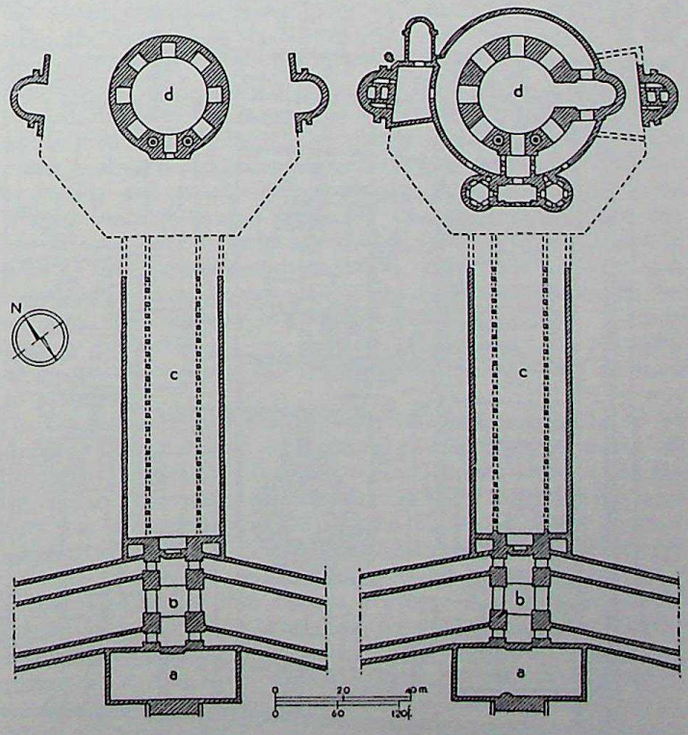
Plans of basilican complexes of the 6th century, partly reconstructed: (*a*) Ravenna, S. Apollinare in Classe (549); (*b*) Ephesus, Church of the Virgin or of the Council (second half of 6th cent.); (*c*) Rusafa, St. Sergius (probably second half of 6th cent.).

date. Outside the metropolitan areas, the three-aisled basilican plan was the customary type. In the 5th and 6th centuries the development of architectural history was still strongly affected by the imperial foundations, only one of which, the octagonal sanctuary dedicated to the Virgin on Mount Garizim, has been excavated. In Gerasa, another important center, three-aisled basilicas were favored, but central-plan structures were also in evidence.

In Egypt, unfortunately, all traces of the ecclesiastical architecture of Alexandria have disappeared. The church architecture of this metropolis, nevertheless, is probably reflected in the buildings of the nearby shrine of St. Mennas, which has a basilica with transept marking the site of the tomb of the martyr, as well as other basilican structures. The oldest true dome on pendentives extant, located in one of these, dates from the beginning of the 5th century. A three-aisled, galleried basilica terminating in a triconchal sanctuary was an important type in Middle and Upper Egypt from the 5th century on (Deir el-Abiad, Deir el-Ahmar, Dendera). A church closely linked with the architecture of the St. Mennas complex, and hence with the Alexandrian style, is the basilica with transept at Hermopolis.

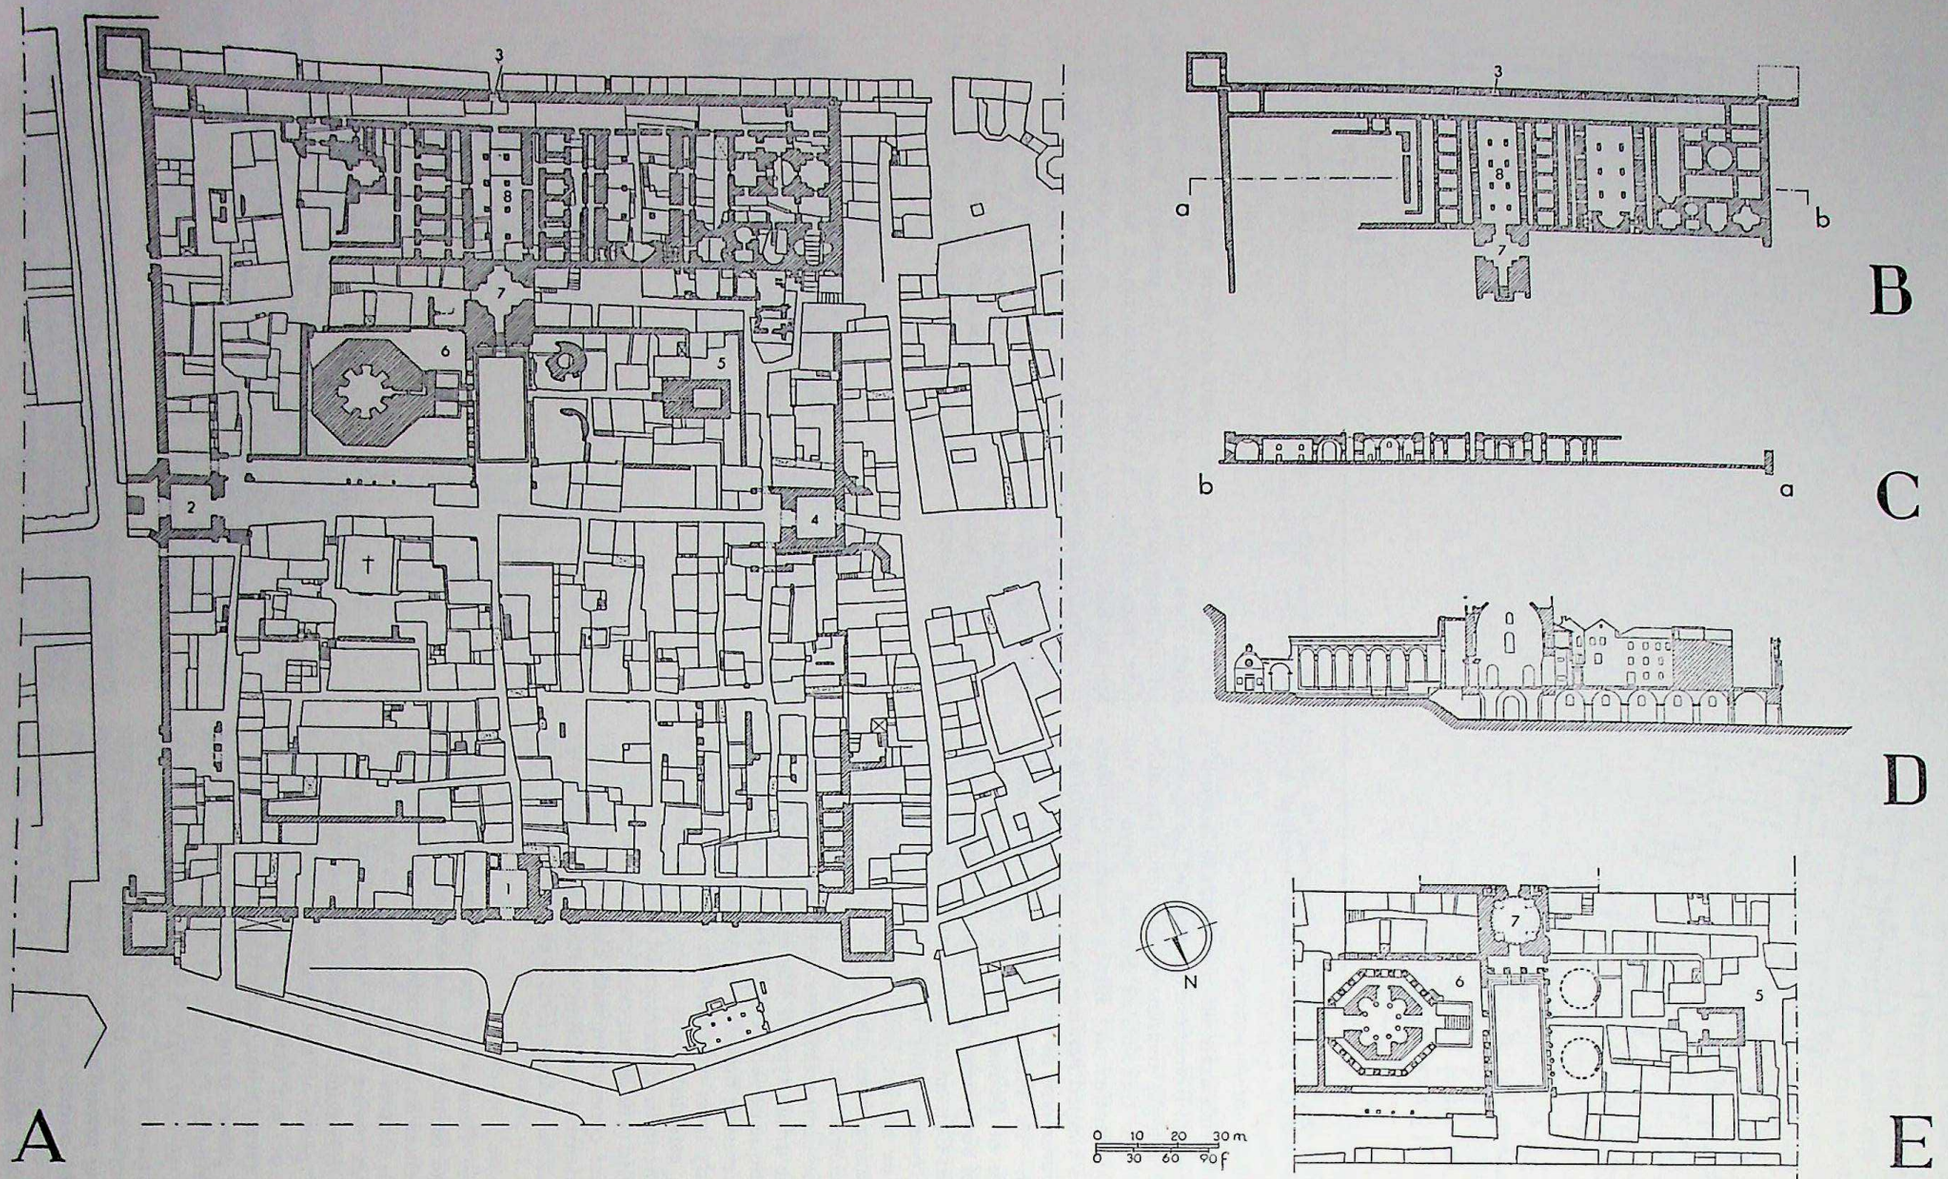
Secular structures. a. Domestic architecture. As far as it has been possible to establish, existing local traditions persisted during late antiquity, and the architecture of the private house was marked by a great variety of regional types. Thus, certain types of houses in existence in the ancient Near East — forms still found in modern times in Asia Minor, Syria, Mesopotamia, and Egypt — were continued in the late-antique era. This was largely the case with the archetypal private house in the plains country, which also, as shown by excavations, made increasingly frequent appearances in the cities, perhaps as some indication of an impoverishment or regression of urban culture in a number of regions (Greece, Sicily, etc.). In the countryside the farmhouse, fortified in frontier areas, assumed added importance, especially in regions where productive land was not only maintained but even augmented as late as the 3d to 6th century (Syria, Palestine, North Africa). Elsewhere, in the Alpine regions, southern Germany, the areas along the Rhine, and Britain, substantial building activity was abruptly brought to an end with the barbaric invasions of the last years of the 4th century. In general, the late-antique farmhouses appear to have followed prototypes from earlier periods. In the cities, besides the more modest kinds of private houses mentioned earlier, the elaborate Hellenistic peristyle house and multistoried dwellings for several families, with provision for shops at the street level, continued in use throughout late antiquity.

b. Official buildings. Late-antique official and public architecture was also marked by continuity of tradition, particularly in the Roman imperial enterprises. The leading architectural centers were the great metropolises of the Empire and the capitals of the individual provinces. Compared with the preceding epoch, however, official architecture on the whole declined and in some localities came to a virtual halt. Various factors were responsible for this phenomenon. Established centers such as Rome declined in importance as a consequence of the founding of new ones (Constantinople). Entire regions became impoverished, either through the migration of peoples, the expansion of the latifundia, the barbarian incursions, or a pervasive insecurity. Public edifices already standing — moreover, sometimes reduced in scale — were found sufficient to meet the limited demands of the new times. In some areas, where the population increased and urban civilization continued to flourish (e.g., Syria), civic architecture evidenced a rich development that extended even to centers in the hinterlands. After the period of political disorder that followed the end of Severan rule, a new flowering of official architecture took place in Rome, beginning tentatively with Aurelian, accelerating under the Tetrarchy and Maxentius, and continuing during the reign of Constantine the Great until the founding of Constantinople in A.D. 330. Thereupon the center of imperial architectural undertakings gradually shifted to the new eastern capital.



Qal'at Sim'ān (Syria), plan of monastic complex: (*a*) Entrance; (*b*) Church of St. Simeon Stylites; (*c*) chapels; (*d*) baptistery; (*e*) monastic quarters; (*f*) guest quarters; (*g*) tomb (*from G. Tchalenko, Villages antiques de la Syrie du Nord, Paris, 1953–58*).

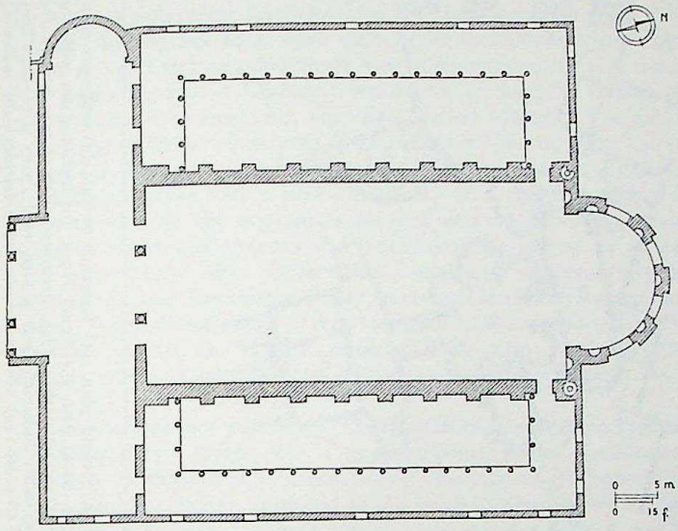
The most notable surviving example of a senatorial assembly hall (*curia*), that in the Forum Romanum constructed for Diocletian, is in the form of a high, rectilinear, and once probably vaulted hall (PL. 33). The three-aisled Basilica Nova of the Forum, begun under Maxentius and finished under Constantine, is an example of a vaulted *basilica forensis* and constitutes one of the greatest achievements in vaulted construction during all antiquity (PL. 36). Its interior layout can be directly related to the frigidaria of Roman imperial thermae. Unfortunately, no examples of such large-scale civic architecture have survived from this era in Constantinople; but commercial towns in northern Syria offer many, albeit more modest, examples of public buildings such as market halls, bazaars, "town halls," and lodging places, dating from the 3d to the 6th century.



The Baths of Diocletian (PL. 37) and those built on the Quirinal by Constantine represented the continuation and further development of the urban type of Roman imperial thermal structure in the late-antique period. Of the thermae of Constantinople, nothing has survived; however, a monumental thermal construction has recently been excavated in Ephesus. In what measure such thermal establishments were a vital feature of even small rural settlements is demonstrated by the thermae of Babisqa in northern Syria (5th or 6th cent.), where the peristyle courtyard reveals a clear connection with older building tradition. A 5th-century thermal building within the pilgrimage sanctuary of St. Mennas near Alexandria was probably used for therapeutic purposes.

c. Palaces and villas. Because of the political decentralization that began in the 3d century, and the consequent establishment of imperial residences in cities other than Rome in both the eastern and western sectors of the Empire, construction of palaces flourished in this period (Trier, Paris, Milan, Aquileia, and later Ravenna, Sirmium, Salonika, Nicomedia, and Antioch). While only parts of the residence of Galerius in Salonika (PL. 44; FIG. 90) are extant (from the period of the Tetrarchy; porticoed streets, triumphal arch, and mausoleum), major elements of the palace complex of Spalato, constructed for Diocletian near Salona in Dalmatia by workmen from Asia Minor, still stand (PL. 34; FIG. 91). This imperial residence, built as a place of retirement, was a self-sufficient fortified city (castrum), with a peristyle at the intersection of the main axes and four portals looking toward the sea. These vantage points were accessible from the central peristyle of the palace, a court flanked by the Temple of Jupiter and the imperial mausoleum. This disposition, through which the imperial palace and the confronted temple and mausoleum were intended to create a single spatial unit, was undoubtedly a late-antique innovation. Of the imperial palace of Trier, which probably dates from the first years of the reign of Constantine, a large single-aisled, apsidal hall with great blind arcades on the exterior has been preserved. Originally flanked by porticoed courtyards, this structure (the so-called "Basilica"; FIG. 93) was probably the throne room, the only one of its kind surviving from the period.

The palatial villa of Maxentius, on the Via Appia near Rome, was joined with the mausoleum of his son Romulus and a large circus. From either the beginning or the end of



Salonika, structures forming part of the palace complex of Galerius. *Left*: Ground plan at the time of Galerius. the 4th century is the vast and luxurious villa at Casale (FIG. 95), near Piazza Armerina in Sicily, which some scholars have attributed — though probably erroneously — to Maximianus Herculius. In addition to a central peristyle, which connected directly with the monumental entrance unit and also led to the main rooms, the villa contained a reception or guest suite comprising a large oval courtyard and a hall in triconch form on one side and baths on the other. Since their incorporation in the Villa of Hadrian at Tivoli, the last-named chambers had become an important part of such princely dwellings. Sumptuous country residences were constructed not only for rulers

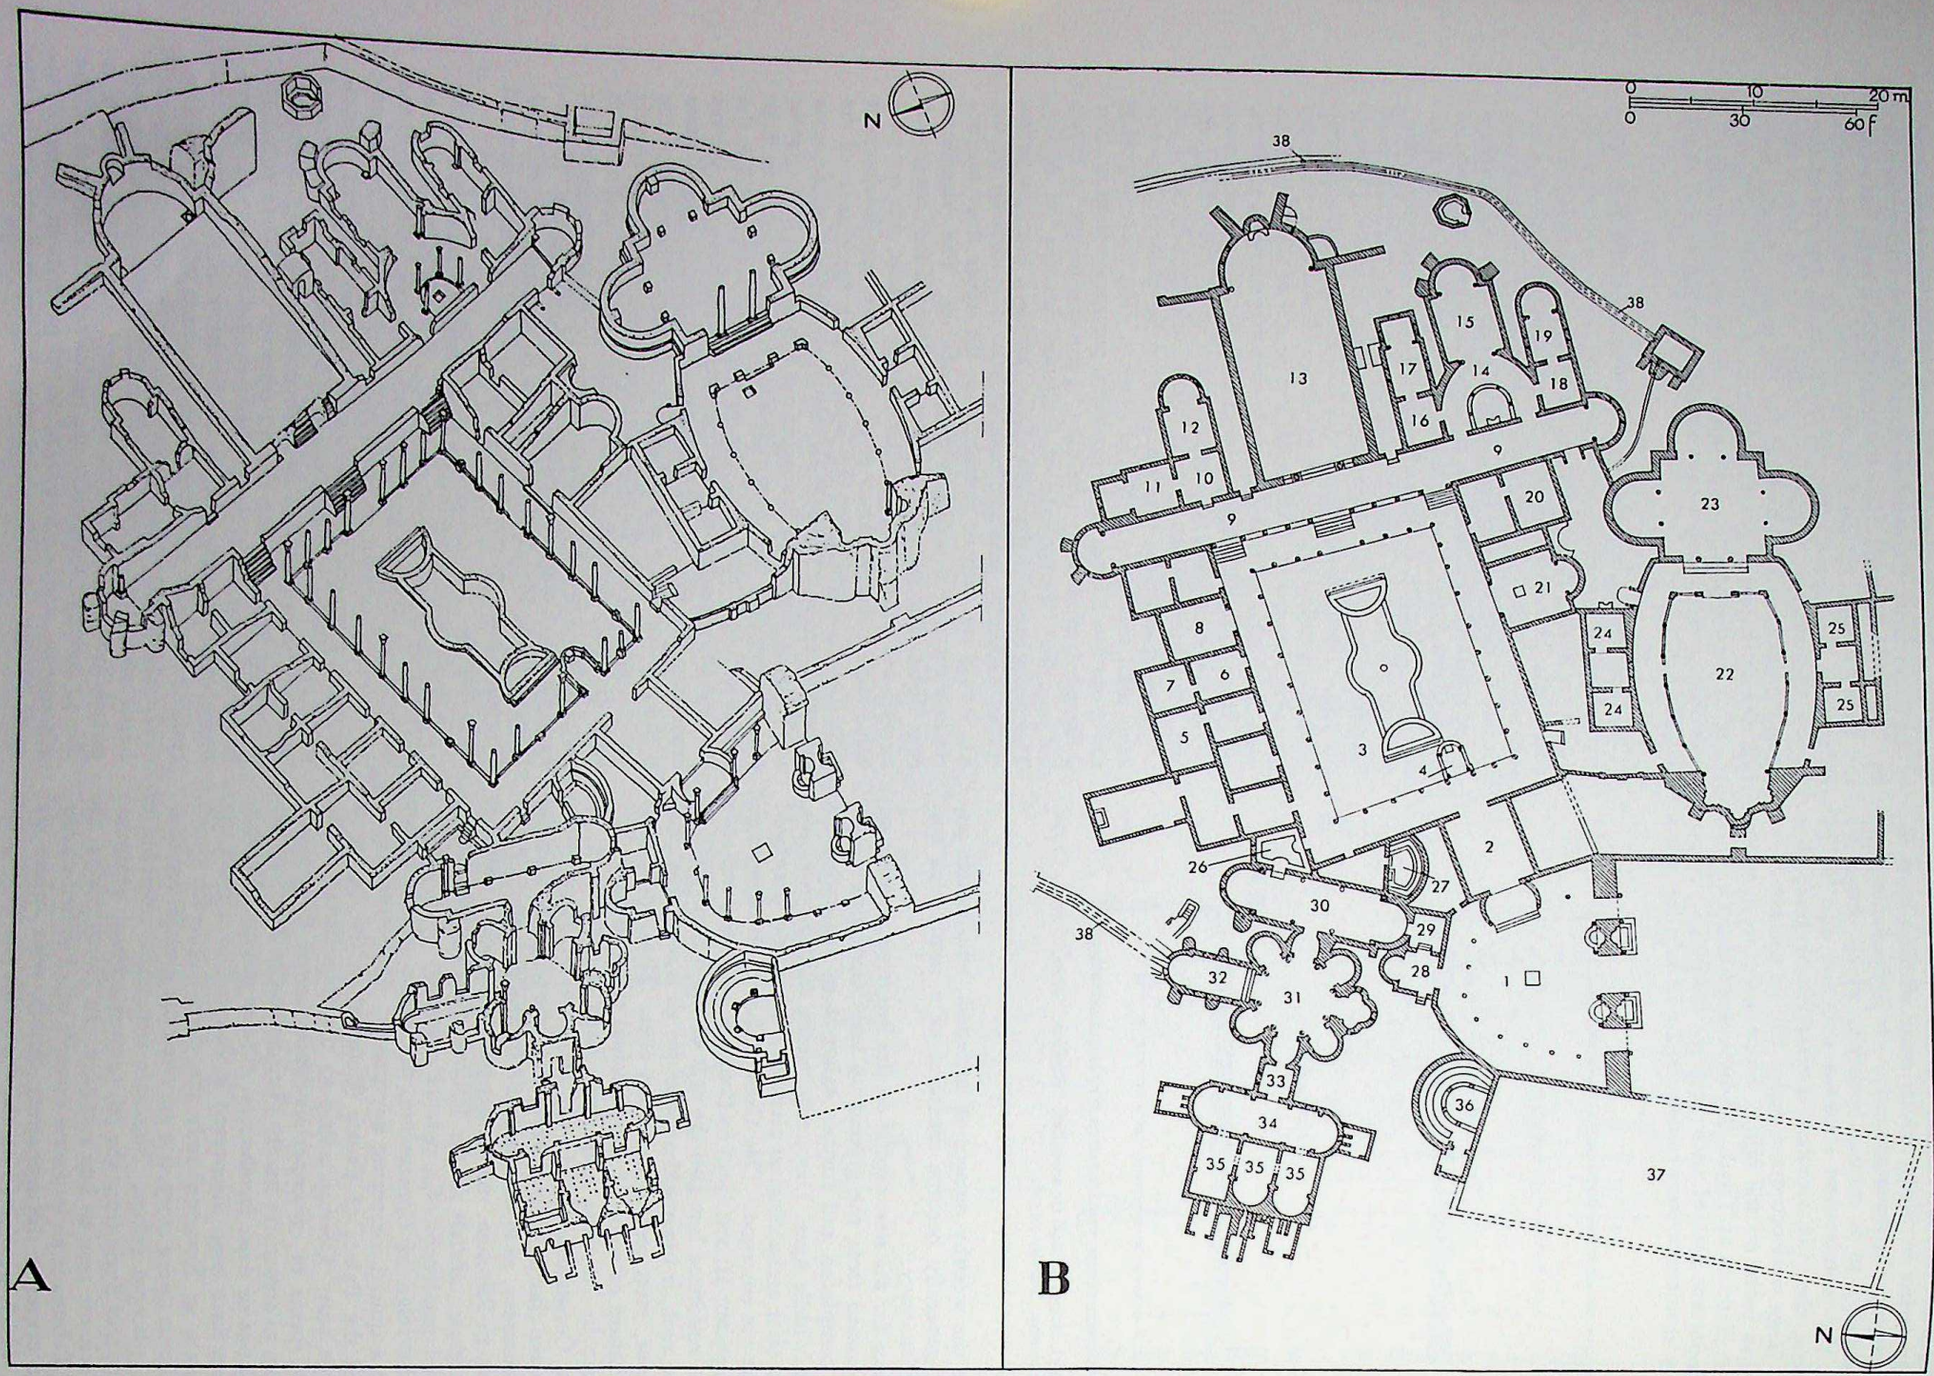
Trier (Germany), imperial hall or so-called "Basilica," plan (*from L. Crema, Architettura Romana, Turin, 1959*).

but also for the wealthy owners of latifundia, who in late antiquity had generally become members of a newly rich and powerful artistocracy.

The palace for the new capital on the Bosporus, a structure no doubt planned from the ground up for Constantine's purposes, was completed and further enlarged by his successors well into the Middle Ages. Despite the wealth of literary sources, however, no clear archaeological picture of this totally destroyed structure has yet emerged. This Great Palace of the Emperors (Sacrum Palatium; II, FIG. 759) in Constantinople was not only the imperial residence but also the seat of the highest political authority; as such, it became the model for all late-antique seats of government, even certain barbarian ones. Thus, more than the nomenclature of some of the principal parts of the Palace of Theodoric in Ravenna must have been derived from its prototype in Constantinople. In the evolution of palace planning, the palace church ultimately replaced the temple within the residential complex, as is demonstrated by the present S. Apollinare Nuovo in Ravenna, the former palace chapel. Undoubtedly, the highest officials in the leading cities of the Empire also occupied residences of a palatial character.

From the reign of Constantine, the palace of the bishop (*episcopium*) acquired increasing importance. Constantine himself donated the Palace of Fausta (Lateran) to the bishop of Rome as his seat. Corresponding to the importance of the diocese, the forms of episcopal residence ranged from sumptuous palaces to structures hardly distinguishable from conventional dwellings or even farmhouses. Traces of extensive episcopal palaces have been discovered in Bosra, Djemila, Salona, and elsewhere; in Ravenna, only the chapel (5th–6th cent.), which was in an upper story, has survived the over-all remodeling of the episcopal palace. Monastic structures, traceable in North Africa and Syria from the 5th century onward, presented a building scheme new to late antiquity. In North Africa, the complex at Tebessa is an imposing example of a fortified monastery: at the center is the monastery church, with atrium and martyrium, which was joined on the west with the cloister and the monastic quarters proper. Because of the large number of extant monuments, the development of monastic architecture in Syria is especially clear. Here the monastic buildings, including the church, were generally situated around irregular-shaped courtyards. The guesthouse, refectory, living quarters of the monks, and other buildings were usually preceded by multistoried porticoes. A mausoleum for the monks, located very near the monastery, was another standard element. In Egypt, traces of such monastic communities (hospices, cells, chapels) have been discovered at Bawit, as well as in the area of Wadi Natrun.



d. Commemorative monuments and funerary architecture. The triumphal arch remained one of the principal types of honorific structures during the late-antique period, as seen in such examples as the Arch of Galerius in Salonika and the Arch of Constantine in Rome (PL. 35). The freestanding column, however, appears to have enjoyed the greatest favor: surviving examples include that of Phocas in the Forum Romanum, composed of salvaged materials; the simple honorific columns of Constantine and of Claudius II, commemorating his victory over the Goths, both of which date from the 4th century; and the Column of Marcianus from the 5th century (last-named three in Constantinople). The colossal Roman imperial columns with spiraling bands of historical reliefs were imitated in Constantinople in the honorific columns of Theodosius and Arcadius; the base of the latter, with a chamber and part of a winding stairway, survives.

The central-plan structure with niches made its appearance for funerary purposes as early as the end of the 2d century (e.g., round mausoleum near Old St. Peter's, Rome), but it was not adopted as the characteristic form for the aristocratic mausoleum until sometime in the 3d century. The more imposing structures had a lower story for burial purposes and an exterior colonnaded ambulatory (the round peripteral temple of Porto; the so-called "Mausoleum of Gallienus" on the Via Appia). The mausoleums of the Villa of the Gordians, from the period of the Tetrarchy, and of Romulus (son of Maxentius) on the Via Appia are without ambulatories; the upper story was accessible through a pedimented propylaeum. The mausoleum near Rome (Tor Pignattara), originally destined for Constantine himself and subsequently for his mother Helena, was not provided with a distinct lower story. A wholly new development with this mausoleum was its junction with the church of the martyrs Peter and Marcellinus, which was placed on the same axis. Also in Rome, the Mausoleum of Constantina (S. Costanza; PL. 38), daughter of Constantine the Great, on the south flank of the memorial church of the martyr Agnes (FIG. 98), is the oldest existing central-plan edifice with an inner ring of columns separating the low-roofed ambulatory from the domed space within, which is lighted by twelve windows. Throughout the late-antique period, however, simple funerary cellae, usually with an apse, continued to be built. Cruciform and triconch mausoleums were also common forms during late antiquity, for example, the Catacomb of Callixtus in Rome and the "Mausoleum of Galla Placidia" in Ravenna (II, PL. 425; IV, PL. 458). From the 4th century, the mausoleum was invariably annexed to a church.

Traditions of pronounced local character continued to be manifest in a number of provinces of the Empire, above all in Syria. Besides the commemorative column, still used in the 3d century, the most common type in Syria until the 6th century was a quadrangular mausoleum of ashlar blocks, rectangular in plan and with a pyramidal stone roof. Multistoried funerary towers, as well as underground mortuary chambers, existed in Palmyra into the 3d century. In Egypt (q.v.) the late-antique, partly Christian cemetery of el-Bagawat has mausoleums of crude, sun-dried brick, for the most part domed and rectilinear in plan and sometimes decorated with blind arcades.

In addition to surface cemeteries, the extensive underground burial complexes known as catacombs (q.v.) were adopted in certain localities, notably in Rome and Alexandria, as early as the 3d century. Originally not exclusively Christian, from the 4th century such underground burial grounds in Rome, Syracuse, Naples, and elsewhere came to be used chiefly by the

C, east–west sectional view of remains below ground level in the south zone; D, north–south sectional view along the axis of the peristyle facing the sea; E, plan of ruins of the central complex (*from Ward-Perkins, 1955*). Christians. In these catacombs, the spatial arrangements conventionally employed for single funerary chambers (cubicula) above ground were mainly employed.

e. Functional structures (*aqueducts, cisterns*). In the late-antique era, functional structures undoubtedly had less significance within the total architectural activity than they had had at the time of the greatest expansion and succeeding consolidation of the Empire; nevertheless, it would be erroneous to infer thereby that the technical capacity for great undertakings of this kind had disappeared. Such may often have been the case in the West, where, as in Rome, it was deemed sufficient to maintain the existing facilities and few new projects were initiated. In regions that were still being developed, however, much work of prime importance was accomplished in this field. The water supply of Constantinople was secured by means of new aqueducts, a reservoir, and distribution system. The most important of these aqueducts, that built by Valens, is still preserved (II, PL. 421). Under the auspices of Justinian, Ephesus was also provided with a new aqueduct. In Constantinople the water carried by the aqueducts, as well as rain water, was collected in numerous cisterns and reservoirs, the largest of which were open to the sky. Others, such as the great reservoirs of Binbirdirek and Yerebatan Saray, were vaulted over on colonnades. The dimensions of these cisterns surpassed all such previous structures. Large cisterns were also characteristic features of most settlements in Syria and Mesopotamia.

Late-antique city planning. The transition toward the typical late-antique city layout was a gradual process that is revealed primarily in details of organization. The city of Philippopolis (mod. Shahba, Syria), founded in the mid-3d century by Philip the Arabian in the Auranitis region, was substantially a traditional Roman urban settlement: a somewhat irregular, wall-enclosed rectangle; porticoed main streets (*cardo* and *decumanus maximus*), with their intersection marked by a tetrapylon; numerous temples, a theater, thermae, and other public buildings, perhaps including a palace near the center of the town. That this entire undertaking followed a set plan conceived elsewhere rather than *in situ* is indicated by the prevailing application of methods of construction foreign to the region (mortar walls, *opus caementicium* vaults).

The founding of Constantinople, and the consequent transformation of the Hellenistic-Roman settlement of Byzantium, served to establish the model for the large late-antique city. Not far from the old acropolis, the Great Palace of the Emperors formed the heart of the new city. Nearby were the principal church, in which great events in the history of the Empire were solemnized, and the Hippodrome, the center of entertainment for the people. The public life of the city focused on the Forum of Constantine, at some distance from the palace complex. With the column in honor of the Emperor in its midst, this space was surrounded by porticoes. The Church of the Holy Apostles, erected jointly with the imperial mausoleum, was situated on the periphery of the city. Like Rome, the city was divided into districts, with the important central tract consisting of the palace, the Hippodrome, and the major churches.

Having begun to make its presence known in the ancient city in the 3d century, Christianity gained importance, through its steadily multiplying religious edifices, in the organization and general aspect of the late-antique city from the 4th century onward. On the outskirts of the cities, Christian cemeteries and memorial sites appeared side by side with pagan burial grounds. The important Christian sites seem always to have been located on the margins of urban centers in this early period. In Rome, the Church received its episcopal seat through the donation of the Lateran — at that time, also located on the edge of the city — by Constantine, after the Edict of Milan in A.D. 313. The focus of Christian life in Rome was thus clearly established on the periphery of the city. A similar situation arose in other cities: for example, Ravenna, Salona, Carthage, Timgad, Tipasa, Seleucia, Basra, Umm el-Jemāl, Palmyra, Thugga, and Djemila. This phenomenon may be explained by the shortage of space at the center of older cities, a zone usually occupied by public buildings and temples; even in the 4th century, these could not be freely disposed of to the Church, and there remained little room for the often extensive church complexes. Thus the advance of Christianity toward the heart of most cities was necessarily a slow process in many instances. Nevertheless, Constantinople was not the only city where the urban center was won over by Christianity at the very outset, for a number of large cities in the eastern segment of the Empire witnessed a like development (e.g., Jerusalem, Gerasa, Miletus, Ephesus, Athens). As early as the 4th century, moreover, the

struggle against paganism led, particularly in eastern locales, to the destruction of temples and their replacement by churches.

Legal measures, the first ever enacted for the protection of monuments, were introduced in an effort to halt the destruction and deterioration of earlier constructions, and the old cities of the Empire reveal much evidence of restoration undertaken during late antiquity. Pagan statuary on public display was sometimes removed, but sometimes assigned new meanings or allusions, and great works of art were thereby respected and preserved from destruction. In Constantinople, works of art from all parts of the Empire were collected and exhibited in the palace, the Hippodrome, and the forums, and it may be assumed that the center of a great city such as Rome must have taken on a somewhat museumlike appearance in late antiquity.

In comparison with the preceding period, however, aspects of life in the late-antique city must have changed but little. Among the amusements, it is certain that the theater disappeared, but enjoyment of the circus and the baths continued uninterrupted, as is confirmed not only by the new constructions but also by evidence of the continued use of older structures for these purposes.

In contrast with the first centuries of the Roman Empire, the construction of fortifications assumed prime importance during late antiquity, for barbarian and foreign peoples were breaking deeply into the European, Asian, and African boundaries of the Empire. Consequently, cities theretofore unfortified began to be provided with protective walls during the 3d century. The massive new walls of Rome, for example, were constructed under Aurelian, and those of Nicaea under Claudius Gothicus. At the beginning of the 5th century, under Theodosius II, the land walls of Constantinople were extended toward Thrace (II, PLS. 420, 421); these fortifications served as a model for the entire Eastern Empire. Under Justinian, the frontier between Armenia and Mesopotamia was reinforced with an impressive

new series of fortified cities, presumably according to plans formulated in Constantinople (e.g., Balis-Meskene, Sergiopolis-Rusafa, Zenobia-Zalebiya).

For the strongly fortified outposts (e.g., the Syrian limes), the Roman square castrum with corner towers was retained. In the layout of the interior, the *cardo* and *decumanus* were no longer obligatory features. At the center, in place of the *praetorium* or the sanctuary of the standard, there was often a chapel. A particular type of military residence along the Syrian-Arabian frontier is exemplified by the castrum of Qaṣr ibn-Wardan, probably erected by masons from Constantinople in the service of the military. The barracks forming the castrum proper, a palace serving as residence for the commanding officer of the territory, and an immediately adjoining church were the most prominent elements. Residences of this type were probably the models for comparable Ommiad castles built in the desert.

Friedrich W. Deichmann

Sculpture. In the 4th and 5th centuries, as in preceding periods, marble remained the material principally employed for sculpture, and marble sculpture was an especially prominent feature of the great cities. In provincial areas the sculptors, like their predecessors, continued to use local stones such as limestone and tufa. Increasing steadily in favor were marbles from the eastern sectors of the Empire, especially those with large crystals of gray-blue veining which were exported from Proconnesus, in the Propontis, throughout the Mediterranean. Luna marble, on the contrary, was continually more limited in use during the 3d century, so much so that regular exploitation of the Apuan quarries eventually ceased. Porphyry, a material that had special status, was taken from quarries near the Red Sea belonging exclusively to the imperial house. Fine bronzework persisted, and its high quality is attested by the gigantic Capitoline head (pl. 51), presumed to be Constantinus II, and by the Colossus of Barletta (pl. 60). Sculpture in stucco also acquired importance during this era.

Sculpture in the round. A major characteristic of the transition period from antiquity to the Middle Ages is the fact that sculpture, relief, and sculptural ornament in general gave way increasingly to mosaic, fresco, and inlay as decorative media. In imperial times the cult statue tended to recede gradually toward the rear of the temple, at last being placed within an apsidal space and thence losing its previously dominant position. With the emergence of Christianity, volumetric representation of divinity disappeared; the divinity was present in the sanctuary only in the sacraments and on the altar, or in relics of the witnesses of divinity contained within or under the altar. Religious art was altered in scope and intent: effort was no longer expended on creating the divine image that is the cult focus, an imposing mass to occupy the ritual space, but rather on the sanctuary surrounding the divine. The artists of the classical period materialized the divine image in space, whereas those of the late-antique period and the Middle Ages were employed in creating a fitting ambient for worship of the divine. Large-scale plastic — or space-filling — religious art vanished, to be replaced by relief sculpture, mosaic, frescoes, and intarsia, which surrounded and gave devotional character to the new sanctuaries.

It is a fact of great importance that, with the exception of the portrait, the making of statuary was generally abandoned in the late 3d and early 4th centuries, in conscious disavowal of what had been the central preoccupation of the Greco-Roman artistic tradition. The idealized statue disappeared; this was true not only for the gods, heroes, demons, and personifications of evil to be combatted by Christianity but even for figures that might be considered religiously neutral. The new Christian types that were evolving were also outside the classical tradition.

Late testimonies of a bygone ideal are such statues as the Capitoline Dioscuri, the Hercules of Piazza Armerina, and a group of statues at Ostia similarly idealized — survivals of a host that had once filled the ancient world. The last significant cult statues erected in the city of Rome were those of Venus and Roma in the Velia temple, which were made of porphyry and alabaster in the time of Maxentius to replace a pair destroyed by fire. In relief sculpture, however, as in mosaic, painting, and minor arts, the ancient world of images lived on, and not solely in iconographical forms that were neutral in religious aspect but also in deities and personifications taken from the ancient mythology. Thus, throughout the 4th and the 5th centuries, the reliefs on triumphal monuments bore representations of Victory with trophies, Eros with wreaths and garlands, river gods, tutelary goddesses, the Sun, and the Moon.

Wherein lies the explanation for these phenomena? A general regression, affecting the will and ability to create full-bodied forms, played a major part in but cannot fully account for the late-antique situation, inasmuch as portrait sculpture continued in the traditional full-round form (e.g., the so-called "Seneca" and "Menander" of the Capitoline Museum). One of the prime factors was the widespread Early Christian abhorrence of anything that might suggest an idol. A two-dimensional representation (including reliefs), however, has neither the corporeal reality of a statue nor its power of substitution. In order to understand this Christian fear of idols, one must bear in mind the way in which the ancient world — in late antiquity as well — felt the presence of the god in the statue. "When images are set up, the habits of the people do the rest," says the 4th-century dogmatist Epiphanius. As early as Constantine's reign there began the struggle against pagan sacrifices and against the ancient religious imagery; every idol was regarded as a possible dwelling or hiding place for the daemon it represented. The execration was then extended from the diabolical statues of the gods to the whole range of idealized statues resembling those of the gods. In some respects, Byzantine iconoclasm was prefigured in the condemnation of pagan images and idealized statuary by the Early Christian rigorists (see images and iconoclasm). It should be added that the use of older statues in the ornamentation of contemporary monuments was still an accepted practice, for instance, the 2d-century statuary of the conquered nations on the Arch of Constantine.

The earliest Christian art showed a decided resistance to direct representation of Christ; instead, symbolic images such as the Good Shepherd were preferred. When Constantia wrote to Eusebius asking for a depiction of Christ, he rejected the request, though it came from the Emperor's own sister. She would never, said Eusebius, have seen such a depiction in any church; this was absolutely out of the question, for it was a well-known fact that any representation of this sort was forbidden to Christians everywhere. It should be observed that Eusebius did not extend his condemnation (*Life of Constantine*, iii, 49) to the symbolic representations. Again according to Eusebius (*History of the Church*, vii, 18), an image of Christ erected at Paneas must have reflected pagan custom; this was probably an image of a pagan deity which had been brought into relation with the Saviour through a local Christian legend. References to images of Christ in later literature, and in the 6th century to the adoration of such images, are always to be identified with figures in relief; images in the round were strongly repudiated, both by the Christian polemicists and in practice. Thus, aside from a few lost pagan images known from literary sources and some Christian statuettes, such as the *Good Shepherd* and the *Christ as Teacher* (III, pl. 304), the history of late-antique sculpture in the round becomes essentially that of the portrait sculpture of the era.

Portraiture. During the first three centuries of the Empire, still following in the tradition of Hellenistic art, the Roman portrait always — despite the variety of styles — found its point of departure in the individual personality. The likeness of the subject was strongly individualized, "alive." About the year 300, however, this situation was radically transformed.

The beginnings of the new tendencies may be discerned in that remarkable portraiture, so full of restlessness and movement, which flourished about the mid-3d century. This art may be appraised in imperial portraits, particularly those of Philip the Arabian and Decius, in private portraits that may

be linked with these, and in the portrait (known through four replicas) of a philosopher, in all likehood to be identified with Plotinus. All these portraits — and the same is true of female subjects — were designed both to reproduce exactly the features of a particular physiognomy and to convey the very pulse of life, the mutations of expression governed by the nervous facial muscles and the inner gleam of personality. The effect of movement, in the turning of a head for instance, is achieved through the shaping of the face. A characteristic method is an asymmetrical construction, emphasized in the musculature of the forehead and mouth through undulating furrows and folds of flesh. Clearly the artist seeks to capture a physiognomic state subject to instant change, a fleet expression stressed by a certain indeterminacy in the sculptural forms. As an example, the forehead of the portrait of Decius is furrowed by deep, yet draftsmanlike incisions of the chisel; the resulting forms are not facial furrows themselves but are those created by the play of light bringing tremulous shadows to them. The hair and beard are formed in a similar manner — not a precision chiseling of the forms of individual locks but a sketch consisting of scratches and points, so that the illusion of a mass of hair is obtained only at a certain distance through the play of light.

These works mark the high point of the major trend in the art of the 3d century, tendencies that were eventually to change the configuration of the antique tradition. About 250–70 this trend was opposed by another, justly termed the "Gallienic renaissance," which tended to conserve the classical integrity of the sculptural forms from such illusionistic disintegration. The two main types of Gallienus portraits serve as the basis for an examination of the sculptural mode during his reign (253–68): the youthful Gallienus depicted in the late 250s and the older Gallienus of the 260s. The first type clearly shows the reaction to the earlier impressionistic portraiture. The restless vitality of the skin surface and musculature has subsided, facial asymmetry yields to a firmly balanced construction, the evanescence of expression is stabilized with a more organic articulation, and the hair and beard are more copious and flowing, with the single components strongly defined. In this art there is revealed a classicizing reaction that was deeply rooted in the whole Gallienic interlude. This taste had its first great exponent in the person of the Emperor, a philhellene and friend of Plotinus who had himself elected an Athenian archon and initiated into the Eleusinian mysteries. In the transition to the portraits of the older Gallienus there occurs a reduction of the organic sculptural form, a change in which the head becomes more massive and simplified, the surface loses the subtle delineation of details, and the hair becomes much longer and is articulated in a single compact mass, with individual locks modeled only lightly on the surface. This treatment is in strong contrast to the loose, deeply chased mass of hair and beard typical in Antonine and Severan portraits, with which those of Gallienus have on occasion been confused. A somewhat ornamental or schematic tendency also characterizes the late Gallienic phase of late-antique portraiture, for instance, in the symmetric lines of the forehead, in the arrangement of the locks, parted in the middle, and in the forms composing the beard.

After this brief Gallienic episode, the artists rapidly returned to the impressionistic illusionism that was the most pronounced trend in the 3d century, and during the last three decades of the century a curious, almost complete dissolution of the traditional portrait forms came about. Representative of this development are two male heads datable about the turn of the century (Naples, Mus. Naz.; Copenhagen, Ny Carlsberg Glyptotek). The almost pained disquiet of the expressions, an agitation curiously restricted to certain parts of the freely asymmetrical faces, is particularly evident in the musculature of the forehead. These details do not proceed from an organic whole; rather, the physiognomy of the figures has been fragmented, and the tense play of features has been fixed in spasms and convulsions. These heads may be compared with the disintegrated compositions typical of the contemporary reliefs, in which the gradual dissolution of form perhaps reflects the anarchic situation found in other aspects of the life of the time, both spiritual and material.

This return to the fragmented, impressionistic style was accompanied, however, by the first signs of another strain of portraiture favoring the compact mass. Four portrait heads dating from about A.D. 300, from both the Roman and the Greek sectors of the Empire, evidence this blocklike simplification of organic form. Within this compact block the individual features became less significant, and in place of deeper, more naturalistic modeling they constituted merely a surface layer. Seen in the effigies on coins, this new portraiture first appeared in the eastern part of the Empire, in coinage from Nicomedia, Kyzikos, Antiochia, and Alexandria. This style soon became common in all imperial provinces, though the West Roman and, even more so, the local styles of Greek portraits generally conserved more of the traditional organic structure.

Characteristic of the development during the following two decades is a tendency to give the head a more regular, conventional form, stereometric in character, as evidenced by the forceful porphyry of an emperor in Cairo, in which the structure of the head and the facial features are marked out in simple flat and curved surfaces of great breadth and clarity, while individual folds, furrows, and locks of hair were rigorously symmetrical in relation to the vertical axis of the face. The hair and beard are schematically rendered with points and incised lines. As may also be seen in relief figures, this evolves into an abstract system for organizing the forms mechanically, gradually superseding the organic basis of modeling.

After those of Gallienus, there is no longer a continuous series of imperial portraits that can be securely identified and dated to provide a comparative base for the history of art. Moreover, the formerly widespread practice of making replicas and copies of notable portraits and types became much rarer in the post-Gallienic period, thereby lessening the effectiveness of the method used to establish an iconography for the earlier Roman emperors, that is, through comparison of numerous replicas. There are other useful criteria, however, such as the study of imperial insignia, the specialized use of porphyry, and the presence of certain attributes or colossal dimensions, indicating an emperor portrait. Through these means a whole series of imperial portraits can be identified from the Tetrarchic era (broadly, ca. 285–312). Sure portraits of Diocletian, Maximian, Galerius, and Constantius Chlorus are found among the famous porphyry groups of the Vatican Library (VII, PL. 371) and S. Marco in Venice (PL. 56). Portraits in a provincial mode are those of Diocletian and his wife Prisca on a frieze in the imperial mausoleum of Spalato. To these verified works and the previously mentioned porphyry portraits may be added two double herms in Salona, also provincial in style, which undoubtedly reproduce the features of the emperors of the early Tetrarchic period. In all likelihood, the Cairo bust represents Licinius. This whole group of works exemplifies the Eastern taste in Tetrarchic portraiture, affirmed in some instances by definite Eastern provenance and also by the use of porphyry for the masterworks of the era. The simplified heads and the schematic, ornamental detail correspond to the images on Eastern coins of this time. To this general taste of the epoch, some reliefs on the Arch of Galerius in Salonika may also be ascribed (PL. 49).

Of the more organic West Roman portraits of the Tetrarchic period, one has survived in two replicas. This represents an emperor who, as comparison with effigies on coins suggests, may be Constantius Chlorus. (The older identification with Maximinus Thrax must be rejected for reasons of style.) Three closely related portraits, one larger than life-sized, probably reproduce the emperor Maxentius. A togaed statue of a sacrificing emperor in the Villa Doria-Pamphili, Rome, in all likelihood portrays Diocletian. Almost certainly another portrait of this emperor is a head in Sabratha, Tripoli; also referable to Diocletian is a double herm combining a Cronus-Saturn figure and a mortal. The so-called "Diocletian" of the Ny Carlsberg Glyptotek, Copenhagen, must be excluded from the accepted catalogue of Diocletian portraits.

Stylistically, the numerous Tetrarchic portrait sculptures may be divided into two broad groups: one of West Roman, the other of Eastern origin. The West Roman group is in turn divided into two subgroups. The early and proto-Tetrarchic portraits are still characterized by asymmetrical structure and agitated, almost convulsive facial muscles, lending a peculiar aspect that might well be termed schizophrenic and suggesting pain or inner conflict. The late Tetrarchic examples present a calmer expression and more stable forms, along with a greatly attenuated symmetry. The first of these subgroups roughly coincides with the Diocletian tetrarchate (292–305), and the second corresponds to the post-Diocletian tetrarchate (305–12). A number of West Roman portraits related to the first subgroup, and constituting a later reaction to the Gallienic style, also exhibit strong links with the illusionistic or impressionist pre-Gallienic tradition of the 240s. Of the emperors who came after Gallienus and before the Tetrarchy, Probus is represented by a colossal portrait in the Capitoline Museum and probably also by two heads of gilded bronze in Brescia (Mus. Romano). The likeness of Claudius Gothicus is perhaps to be identified in a relief depicting a sacrifice, in the Museo Nazionale Romano, and that of Carinus in a colossal head in the Palazzo dei Conservatori.

With these more or less datable West Roman works as a point of departure, a series of portraits of Eastern provenance — notwithstanding their more plastic style, evident especially in the rendering of the hair — can be attributed to the period from Gallienus to Constantine. A head in Athens (Nat. Mus.) and another in Istanbul (PL. 48), from Nicomedia, probably portray Diocletian or his imperial portrait type. Of particular interest is a group of heads of philosophers that ranges from the Gallienic phase into the 4th century; outstanding among these is a portrait (preserved in five replicas), dating from the first decades of the 4th century, which almost certainly represents Iamblichus, the major philosopher of that era.

Finally, comparison of a typical West Roman work, such as the statue of Diocletian in the Villa Doria-Pamphili, with representative Eastern-inspired works, such as the imperial groups of S. Marco and the Vatican Library, confirms that the stylistic contrast between East and West observed in portrait heads extends to the figure style as a whole. In contrast to the emphasis on undifferentiated mass in the Eastern works, which show a lack of sensitivity to ideal proportion, the Western work has preserved more of the proportions, the organic structure and symmetry, and the richly carved drapery of the classical tradition of Greco-Roman statuary. The abstraction and monolithic rigidity of this Eastern style are nonnaturalistic qualities more suggestive of medieval than of classical sculpture.

The beginning of the Constantinian period witnesses the disappearance of the impressionist tendency of the 3d century, with its manipulation of light, asymmetry, and flickering musculature and epidermis. The agitated folds and furrows become resolved in simplified, regular features that are masklike in expression. The gaze no longer seems uncertain but instead is as if fixed upon a distant object. Comparing a head of the Tetrarchic period with the famous Lateran portrait of Dogmatius, placed by inscription within the Constantinian period, one notes that, even though the general aspect of the pre-Constantinian head type with short hair and close-cropped beard has been preserved, there is clear indication of the gradual crystallization of form achieved during the age of Constantine. The whole is stereometrically simplified, and the individual elements are symmetrically ordered around the median axis of the face. The area covered by the short hair is bounded by carefully described contours, with the widow's peak over the forehead accenting the central axis. The lines of the brow undulate in easy, parallel curves. The transcendent gaze of this "mask of the spirit" — the eyes framed and highlighted by concentric curves — is the most significant characteristic of the portrait sculpture of the epoch. In this intense, fixed look there is perhaps a foretaste of the Byzantine icon.

As vital, organic structure gives way to canonical regularity, so the strongly individual portrait yields to the conventional type. Each of the emperors of the Vatican porphyry pairs is based on the same model, the image of the emperor-god. Subsequently, however, it was not this deified ruler figure from which the definitive hieratic type was derived but rather that of the sovereign Constantine, the heir of the Tetrarchy. In his reign and thereafter the images of Constantine created the *typos hieros* of the epoch, exemplified by portraits such as the colossal head of Constantine (PL. 53) formerly belonging to the huge enthroned statue in the Basilica of Maxentius or of Constantine. This imposing statue was originally situated on the main axis of the basilica; in its expression of divine majesty, it presents all the qualities of hieratic frontality, impassiveness, and stereometric form previously described as characteristic of the portraiture of the time.

This fixed gaze of the great eyes in such portraits, this remote stare into infinite space, is arresting and of heightened intensity, truly an attempt to project the "mirror of the soul." In order to grasp the significance of this gaze to contemporaries, one should recall the importance attached to the eye in the pursuit of knowledge and understanding by the people of antiquity, for whom the coexistence of man with divinity is realized in a visual symphysis, in a "connaturality" between the viewer and the being who is seen. In an identification of this type, man is exalted beyond his human limitations and participates in divine essence and actions, thereby acquiring superhuman powers. He is raised up to God and becomes "holy" himself. This inspired contemplation which fills a man with daemonic force is the quality with which late-antique artists sought to endow the visages of god-emperors, particularly through the accentuated concentric curves of the lids and brows. Ineffably calm and removed from time, the images have a quality of eternal repose. A suggestion of this sacred prototype also appears in nonofficial portraits: the fixed gaze of the visionary provides the formula for a purely spiritual idealization, one which is "pneumatic," in contrast to the idealization of physical beauty in the classical tradition.

Thus, with the portrait of Constantine there arose a durable imperial symbol, an iconographic formula for expressing divine kingship which posterity was to rework and vary but which, to some degree, was unfailingly present in late-antique representations of emperors. Just as the Constantinian order created the basis for the Byzantine state, so Constantinian taste, as a reflection of this organization, furnished the archetype of the late-antique and medieval imperial likenesses.

It is of passing significance that the new arrangement of the hair in the portraits of Constantine created a genuine "state coiffure" for the emperors, little subject to the usual changes of fashion. Although this coiffure was on occasion modified in details, its basic formula remained unchanged for centuries; it is related of the Eastern emperor Heraclius (610–41) that in preparing himself to rule he had his hair and beard cut according to this imperial mode (Cedrenus, Bonn ed., I, p. 714).

It is possible to assemble a catalogue of portraits which, from the time of Constantine, includes the likenesses of his sons and of the emperors of the second half of the 4th century and ends with a series of unidentified portraits that for stylistic reasons should be assigned to the 5th century. As the individual physical characteristics gradually disappear, the conventional schema of majesty, of a ritual personality, emerges like a mask in the facial features. A colossal head in the entrance hall of the Vatican Museums and a colossal bronze in the National Museum, Athens, attest to the persistence of this imperial type into the early Middle Ages. The historian Ammianus Marcellinus (xvi, 10) gave a notable description of Constantius II's solemn entry into Rome: "He gazed fixedly forward as if wearing an iron collar around the neck, turning his head neither to right nor to left. He was not as a living man, but the icon of a man." This hieratic imperial style, which, as an expression of divine majesty, gave its cast to portraits, palaces, and life in general during the era, came down via Byzantium to imperial Russia. A contemporary of Czar Alexander III described him in words surprisingly similar to those of Ammianus: "He looked out fixedly, directly forward, and his features were as still as those of a statue — a man of stone, a personification of power and destiny."

The history of portrait sculpture in the time of Constantine and his sons may be divided into an earlier phase, extending from 312 to 324, and a later period encompassing the era of world dominion of Constantine and his sons, firmly established after the victory over Licinius and the foundation of the new capital on the Bosporus (324–61).

The point of departure for the first period is provided by the portraits on the Arch of Constantine: specifically, the heads reworked in 312–15, including those on the medallions from the time of Hadrian and the two heads on the Trajanic reliefs placed within the main opening, and also a very fragmentary head in one of the Constantinian friezes, depicting his seige of Verona. This last-named and the two reworked Trajanic heads portray Constantine; those of the Hadrianic medallions, paired images of Constantine and Licinius representing the concept of imperial concord ("Fit amicitia, utriusque imagines simul locantur"; Lactantius, *De mortibus persecutorum*, XLIII, 3). As on the coins of the time, the effigy of Licinius is still of the Tetrarchic type, with short hair and beard. The portraits of Constantine — "turbator et novator omnium rerum" — reveal a radically new type, however: beardless, with pronounced features and thick locks of hair. This contrast between the two types, which has been the source of divergent opinions as to the dating of these imperial likenesses, is characteristic of the portraiture of the time and, for example, is found in all the anonymous heads in the historical friezes of the Arch of Constantine.

A group of colossal Roman statues dated about 320, among which are the figures of Constantine and Constantine II (X, PL. 145) presently on the balustrade of the Capitoline and the figure of Constantine in the atrium of St. John Lateran (PL. 50), substantiates a marked traditionalist and classicist constraint, which seems to revert to the taste of the Augustan age, both in Rome and throughout the Empire during the 4th century. All these statues are related to a conventional type: the emperor as an armed military commander. The proportions are somewhat distorted, with the robust body strongly emphasized and the head too small. The balance of the figure does not have the classic freedom, and the contours of the face are peculiarly sharp and linear.

In coin effigies the Tetrarchic type dominated in the East until about 324, whereas in the West the Constantinian type was predominant. There remained the distinction between the simplified and compact portrait of the East and the more individualized and naturalistic one typical of the West. In the late Constantinian period — that is, after 324 — the Constantinian type spread throughout the Empire, gradually leveling regional divergences of custom and taste, and in the process Eastern and Western elements interpenetrated. The Roman and Western type of Constantine invaded the East, just as Latin supplanted Greek as the official language of the East, with the founding of the "New Rome" on the Bosporus. The most significant outward indication of this development was the fact that Constantine began to exhibit a diadem and a longer, more sophisticated hair style in his images about the time of this assertion of his universal monarchy and the consolidation of the Empire.

A series of monumental portraits in this style forms a relatively cohesive group, a characteristic member of which is the above-mentioned colossal head of Constantine from the Basilica of Maxentius or of Constantine. The identification of this fragmented colossus with the statue of Constantine with the cross erected immediately after his entry into Rome (312), of which Eusebius speaks, does not seem compatible with the Constantinian iconography that is better documented, such as the reliefs on the Arch of Constantine, nor with their religious significance, namely, the motif of Sol Invictus. Very similar to this head is the colossal bronze portrait of the Palazzo dei Conservatori, which may well be a late head of Constantine, although it is customarily identified with one of his sons (PL. 51). An imperial bust in the Musée Lapidaire, Vienne (Isère), probably represents the Gallic usurper Magnentius, and thus it may be dated 350–53. A reflection of the colossal gilt statue of Constantine-Sol, a celebrated work which was erected on a porphyry column in his Forum in Constantinople and which became the object of general veneration, is quite likely found in a bronze statuette from Jutland (Copenhagen, Nationalmus.), depicting an emperor crowned with rays of the sun. The face and the hair style are clearly Constantinian, and the jewel placed at the center of the crown of rays also seems an appropriate token for an emperor. The right hand was raised in the magical gesture of the Sun-Emperor, while the left bore the globe, corresponding exactly to the famous image of the rising sun on a medallion of the Arch of Constantine.

Representations of the emperor with attributes such as the thunderbolt or the aureole, in many received directly from the hand of a god, were intended to affirm his divine ordination. In late-antique narrative reliefs and on coins the supreme god, be it Juipter or Sol, appears as the supernatural escort (*comes Augusti*) and inspiration of the deified emperor, oftentimes delivering to him the insignia of might and victory. Besides being honorific effigies of an emperor, these portrayals revive the concept of the emperor as divinely sanctioned intermediary between the gods and mortals.

After the conversion of Constantine, the supernatural association of Christ with the earthly ruler supersedes that between the emperor and the antique gods. The new link with Christ was conveyed by images that frequently bore striking resemblance to the pagan treatments of this theme. Typical presentations include: the Holy Spirit, in the form of a dove, hovering above the emperor and giving him divine inspiration; Christ or angels arraying the ruler with imperial insignia as the vicar of Christ in the world empire; the emperor being crowned victor in the name of Christ, either by Christ Himself or by angels. A corresponding expression of the theme is found also in the literature of the time, where the emperor of the early Middle Ages is referred to as "wreathed" or "crowned by God." The inscription on the base of the column statue of Phocas in the Forum Romanum (A.D. 608) designates Phocas "the eternal emperor crowned by God," thereby asserting the divine right and the presence of a supreme, eternal order within the temporal power.

To the Constantinian and post-Constantinian period may also be assigned a series of female portraits, both on grounds of general style and of coiffure. The female coiffure in the Tetrarchic sculpture is distinguished by having the hair drawn back to the nape of the neck in a flat plait, which is then pinned to the top of the head and above the forehead, where it stands up as if it were a diadem. Also characteristic are the side strands of hair at the neck, which are free of the plaits and which are gathered and pressed onto the nape of the neck almost like a roundel at the back of a battle helmet. Nor is this necessarily a chance comparison, for these were the times of the soldier emperors. Such a hair style appears on the coins of Severina, wife of Aurelian; Magna Urbica, wife of Carinus; and Valeria, daughter of Diocletian and wife of Galerius. Its use continued until the time of Constantine, when it was worn by Fausta (d. 326), wife of Constantine, and by his mother Helena. A variant of this style, about the turn of the century, was the coiffure in which the wide plait was divided and arranged atop the head like a crown or turban. These two hair styles were typical of the late-antique era and subsequently became the "state coiffure" of the empresses; though on occasion altered in particulars, like the official male hair style they retained their fundamental shape. In rare instances, there are female adaptations of the emperor's own hair style.

A place of prime importance among the female figures with turban coiffures is given to a seated statue that has survived through several replicas (Mus. Cap.; Uffizi), a subject that has been rightly identified with Helena, the mother of Constantine. In this figure the late-antique taste in drapery is revealed by a certain hardness in the *ductus* of the lines and a rather monotonous composition, especially in the cornucopia-shaped folds along the lower border of the *apoptygma*. Whereas these statues are close enough to classic models to be confused with them, another standing female figure (Ostia Antica, Mus. Ostiense) that reproduces a classic type, namely, the so-called "Pudicitia," reveals the late-antique touch much more strongly. The figure

has completely lost its classic sculptural volume, the proportions are changed, the balance seems unsteady, and the rendering of the folds is quite harsh at the corners. Yet another female portrait of the imperial type, one that is markedly Constantinian, is located in Como (Mus. Civ.).

The last descendant of the Constantinian dynasty, Julian the Apostate, is represented by two datable statues in the Louvre that have wrongly been stigmatized as forgeries (PL. 57). The emperor-philosopher is shown according to the traditional scheme for philosophers, with a long beard, wearing the pallium, and carrying a rotulus in his left hand — a balanced, weighty figure in the classical spirit, belonging to the same line as the statue of Helena and the three imperial figures of the Lateran and the Capitoline. As shown by the sculpture on sarcophagi, this classicizing current opposed to the characteristic late-antique taste achieved its highest level in the 350s and 360s and was in vogue throughout the Valentinian-Theodosian period. This sculptural tendency parallels literary and religious attempts to restore paganism, which was still strongly supported by the senatorial class of Rome.

Important criteria for the determination of the Theodosian portrait may be derived from the reliefs on the base of the obelisk of Theodosius in Constantinople (PL. 57; II, PL. 467; VII, PL. 265), erected in the Hippodrome in 390. When compared with the reliefs on the Arch of Constantine, the Theodosian character of the sculpture on this base emerges clearly: the svelte, elongated proportions and the aristocratic, relaxed attitudes contrast with the rough, stocky, and rigid figures on the Constantinian monument. The soft, flowing drapery and the roundness in the modeling of the Theodosian examples is opposed to the harder, more angular forms of the Constantinian period. Consequently the Theodosian heads have a gentler, smoother, and less bony aspect; they have more elegant features and a free disposition of the abundant locks of hair. A slight smile diffuses a mood of affable grace over the faces of the Theodosian period, in contrast to the severity of the Constantinian ones; there breathes in the former expression a sense of ease and a relaxation of the human spirit, perhaps the visual realization of the renewed classicism characterizing the period from Julian through Theodosius. While the Constantinian form of the hair and the absence of the beard continue, without exception, in the relief images of the emperor as well, new forms develop in the subsidiary figures; in some the beard reappears and another layer of tresses frequently is displayed over the forehead and temples. Barbarian *foederati*, for example, have a distinctive coiffure that is shown on a series of herms in Trier and on a grave decoration in Bulgaria.

A group of portrait statues, closely related stylistically, belong to the Theodosian period: the togaed statue of Valentinian II from Aphrodisias (Istanbul, Archaeol. Mus.); a colossal head, splendidly preserved, in Rome (Gall. Borghese); a small cuirassed bust in Lyons (Mus. B. A.), which probably represents Maximus, the late-4th-century Gallic competitor of Theodosius; and a head in Trier, perhaps a portrait of Gratian, who had his capital there. Two other togaed statues in Rome (Pal. dei Conservatori) are linked with this group; the flat, arid rendering of their garments characterizes Roman in contrast to Greek work of the epoch, exemplified by a statuette of an empress from Cyprus that has been identified with Theodosius' consort Aelia Flacilla (PL. 57).

This Theodosian ambient seems to have provided the starting point for the creation of an unusual group of portraits, apparently executed sometime after A.D. 400, that is, during the time of Arcadius and Honorius. The oval form of the faces acquires an almost Gothic slenderness and is as smooth as an egg; the aquiline noses are long and thin, the eyes narrow and quasi-oblique, the fine lips faintly smiling, the chins elongated, and the hair indicated with shallow, sharp lines. In some instances there is an unobtrusive beard. The pronounced arc of hair in the tradition of Constantinian portraiture is broken up into pointed locks around the forehead; or else, as previously mentioned, the coiffure becomes crownlike, a form that was increasingly common during the 5th century. The finest examples of this group are a man and wife in Salonika (Archaeol. Mus.), and a male portrait in Rome (Mus. Naz. Romano) and another in Munich (Glyptothek).

The reliefs of the 5th century — the most extensive and useful basis available for continuing a chronology of portraiture during this period, since it lacks a sequence of surely identifiable emperor portraits — reveal an ever-increasing flatness and linearity, a rigidity and hardness in the treatment of forms, as evidenced in the ivory diptychs. The diptychs ascribed to the first half of the 5th century by R. Delbrück, for example, the so-called "Patricius" in the Cathedral of Novara (Bib. Capitolare), differ from preceding ones dated about 400 in the marked regression of sculptural volume and in the lack of rhythmic ponderance and harmony in their angular figures. At the same time, however, there is a new realism in portrait heads other than idealized emperors and saints. The hair takes the loose form of natural locks or else the crownlike coiffure, and as during the Tetrarchic period, the short beard becomes a general feature. The official Constantinian type, limited to probable portraits of emperors, gives way to a more sober, naturalistic characterization, in contrast to the rather academic classicism of the preceding period — perhaps indicating the recession of the pagan reaction.

These diptych portraits of the first half of the 5th century are related to a group of Eastern and Western portrait sculptures, the most important of which are the "magistrate" figures found at Aphrodisias (PL. 59; II, PL. 465), a togaed statue in Ostia, and two heads in Aquileia. All these likenesses of private individuals reveal a crude realism, owing in part to an emphasis on the irregular — and even the ugly — in facial features and in part to a lugubrious, almost exasperated expression. If these are compared with the portraits among the reliefs on the Theodosian base in Constantinople, the change is immediately apparent: a new human type, anguished and introverted, far removed from the classically beautiful form and its surroundings, has replaced the calm, relaxed humanity of the pedestal figures. Therefore it is reasonable to assume a certain chronological advance from the Theodosian age, probably into the second or third decade of the 5th century.

A clear typological relationship with this last group of works is revealed by a series of unusual portrait sculptures from Italy, Greece, and Asia Minor, which in style and technique, as well as in the forms of beard and hair, seem to form a homogeneous group. One of these portraits has survived in two copies, one of which, a head larger than life size with a long beard and the crownlike hair, is at Ostia. The expression is an ecstatic, uplifted gaze, doubtless a magnate of the era represented as *homo spiritualis*. Numerous other portraits of the time, including one at Ephesus, have the same fanatical, introspective aspect. The stereotyped spirituality of the expression, produced by the severe symmetry, the accentuated fixity of the gaze, and the upturned lines of the forehead, prefigures Byzantine icons. The head, both in frontal and profile views, is inscribed within a rectangle and reduced to an almost prismatic form. The orthogonal emphasis of the face is also recorded in contemporaneous literary descriptions of the rectangular facial type of the Neoplatonic philosopher Isidorus in the guise of Hermes Logeios. The relationship of these heads to those known to be from the beginning of the 5th century is again like that of the diptychs of the second half of the century (e.g., the Boethius diptych, A.D. 487) to those of the first half. The suggestion of mass in the later diptychs recedes even further, and the flattened figures become rigid as tree trunks. On the basis of this similarity, the sculpture in this rectilinear mode may also be attributed to the second half of the 5th century.

The formal shift observable in these works, from the Aphrodisian magistrates through the Aquileia heads to the portrait of Ephesus, is characterized by progressive simplification of organic form and concentration on the elements of spiritual expression, notably the eyes. This transformation appears all the more clearly inasmuch as the basic physiognomic type remains unaltered: long, thin, and ascetic face; narrow, tightly shut mouth surrounded by sharp lines; similar hair and beard forms. But organic structure gives way to a masklike formula for the spiritual life. The works under discussion enable one

to follow the process by which the late-antique Greco-Roman portrait — the "Eugenius," for instance (PL. 59) — ultimately evolves into the Byzantine icon. The gradual growth of this spiritual stereotype is perhaps most clearly presented in the conventionalizing of the eyes and in the pronounced, schematic lines of the forehead. The intimate connection obvious between the Ephesus head and an icon of the early Middle Ages, such as that of the Bawit bishop, makes further comment superfluous.

Whereas in the 4th century the most extended series of portraits was that of the emperors, the works surely attributable to the 5th century do not include a single definite imperial portrait. This fact should not, however, encourage the false conclusion that the central theme of Roman portraiture, the imperial image, had disappeared. Rather, it signifies that post-Constantinian imperial portraiture constituted a wholly distinct category and that private portraits departed increasingly from the imperial type; consequently, portraits of individuals from this period are of little use in evaluating official images.

Because they are in poor accord with the free classicism distinguishing the latter part of the 4th century, certain heads of the Constantinian *typos hieros*, reduced to masklike simplicity, such as the so-called "Valens" of the Uffizi or that of Valentinian I in the Ny Carlsberg Glyptotek, are difficult to place within the development ranging from the Julian statues of the Louvre to that of Valentinian II in Constantinople and quite likely are not earlier than two emperor portraits in Berlin that may have been rightly identified as Arcadius and Honorius. The so-called "Honorius" of the Louvre (PL. 58) is an imperial portrait of later date; the delineation of the eyebrows and the slant eyes relate it to private portraits from the second half of the 5th century. In the Colossus of Barletta (PL. 60), the mask of the emperor yields to typical features of the late or mid-5th century, which would seem to support its identification with Marcian (450–57). The so-called "Eugenius" of the Louvre (PL. 59), with features also suggesting a date well into the 5th century, has perhaps been correctly linked with Theodosius II (408–50). An imperial portrait in the Castello Sforzesco in Milan, a compelling figure in which one would like to recognize the magnificent Theodora, discloses instead a stylization of the eyes and mouth that is closest to portraits of the second half of the 5th century.

The same distance existing between the imperial portrait and that of a private citizen also exists between the images of saints and those of ordinary mortals. The concept "beauteous as an envoy of God" is valid for the Christian world as well as for the pagan; the saint, too, becomes a *typos hieros*. Neoplatonic theosophs and Christian saints are distinguished from common men by means of "angelic" beauty, the reflection of divine qualities revealing a God-sent man. Therefore, the word "charis" for the Christian author has the double significance of beauty and supernatural grace; the visible beauty reflects the divine grace. In the same way, the emperor inspired by God partakes of celestial beauty: he is "dis simillimus princeps," and his individuality is hidden behind an ideal type. The human qualities in the portrait of an emperor or a saint are concealed behind an elevated mask, representing more sublime and heroic qualities than those of other individuals — just as the ancient stage masks conveyed qualities more sublime and essential than did the faces of the actors hidden behind them.

The common man, however, as he is seen in the portraits of the 5th century, and later in those of the early Middle Ages, is characterized as a natural being set apart from any sacred type, with his human failings, abnormalities, weaknesses, and ultimately his ugliness and misery. In ex-votos from the 5th to 8th century (e.g., mosaics in Salonika; frescoes in S. Maria Antiqua, Rome) the representation of human dedicants flanked by their celestial protectors clearly reveals the dualism between holy, eternal beauty and the imperfection of the natural world. Literary sources testify that throughout the 4th, 5th, and 6th centuries portrait statues continued to be erected publicly in honor both of emperors and of private citizens. Large equestrian images were erected in Constantinople as late as the time of Justinian, but many of these may have been earlier statues adapted or reworked. The equestrian statue of Theodoric the Great that Charlemagne took from Ravenna to Aachen probably belonged to this East Roman tradition. A series of headless statues, once portraits of individuals, discloses the same retreat from organic structure evidenced in the portrait heads of the 5th century. Details are compressed into a compact block, and the folds of the drapery fall vertically as if governed by a plumb line. An example of this nonorganic form is a togaed figure in the Selçuk Museum (Ephesus), which undoubtedly had a head of the same style described in the last portrait group. A *non plus ultra* of blocklike construction and severe linearity is found in certain statues from Corinth and Megara, some of which must be as late as the 6th century.

Yet another group of portrait heads evidences the continuation of late-antique portrait sculpture beyond the 5th century and into the early Middle Ages. The group — including three curious images of an empress or an Ostrogothic queen (PL. 59), some fragmentary male heads, and an emperor portrait — is characterized by extremely rounded faces with protuberant eyes, having prominent, concave pupils of hemispherical form, and by the softness of the fine mouth, which sometimes assumes a smile. These and other related examples probably date from the end of the 5th and first half of the 6th century. Of uncertain date is a porphyry portrait of an emperor, wearing a diadem, in S. Marco; because of the flattened nose, it has been identified with Justinian II Rhinotmetos by Delbrück and thus dated about 700.

Relief. Although there are frequent lacunae in the sequence of dated historical reliefs, the existing works range through the mid-5th century, whereas dated and identifiable portrait sculptures of emperors beyond the 4th-century examples are not known. The chief types in this category are commemorative historical reliefs and sarcophagus decoration. The latter form can oftentimes be reasonably dated by stylistic reference to dated commemorative reliefs or portraiture. On this basis, reliefs may also furnish a varied estimate of the development of late-antique sculpture.

Of the Arch of Galerius in Salonika (PL. 49), there remain only two piers, covered on each face by four superimposed relief panels bearing scenes of Galerius's military expedition against Sassanian Persia in 297. Scenes of battle, allocution, and marching alternate with scenes of homage to the emperor, such as the *adventus Augusti*. These friezes have not yet received a fully convincing interpretation.

The Diocletian decennial base in the Roman Forum (PL. 49) probably dates from the year 303. On the front are two Victories bearing a votive shield with the inscription recording the *decennalia*. The other faces display three related reliefs. The middle relief represents an imperial sacrifice, toward which a sacrificial procession advances from the left relief, while from the right there approaches a file of representatives of the senate and the army. This base once belonged to an honorific column topped with an imperial statue; along with four other similar units it formed a monument to the Tetrarchs, erected behind the Rostra in the Forum Romanum. The whole can be reconstructed on the basis of a Renaissance description of these socles and the depiction of the original monument in a relief on the Arch of Constantine. Four columns bearing statues of the Tetrarchic rulers were grouped around an image of Jupiter.

The Arch of Constantine in Rome, dated between 312 and 315, is the oldest Roman monument in which spoils were extensively used, for a large part of the architectural and sculptural ornament came from earlier monuments. Attention here will be centered on the late-antique portions, that is, those carved specifically for the arch. On the front of each of the eight column bases is a Victory; on two side faces are triumphal processions, including soldiers with standards, the *dei militares*, Victory and Sol Invictus, barbarian prisoners, and sometimes the captive families near a trophy. On the intrados of the lateral arches are headless busts of emperors and one of Sol Invictus, Constantine's protector. Eight rectangular fields above the two

lateral arches contain reclining river gods; in the four corners of the central intrados are winged Victories and genii of the seasons. Among the various medallions, those of the short sides are late-antique: one shows the rising Sol Invictus, the other the setting moon. The most important part of the late-antique relief decoration is the historical frieze that, in six large sections and four smaller ones, girds the arch. In a chronological presentation are shown the departure of Constantine's army in the war against Maxentius (*profectio*), the siege of Susa, the Battle of Milvian Bridge (VII, PL. 265), Constantine's entry into Rome, his allocution at the Rostra of the Forum (*oratio*), and his largesse to the Roman people (*liberalitas*; PL. 54). In reliefs taken from earlier monuments, the heads of emperors were transformed into those of the reigning sovereigns Constantine and Licinius, and the spoils were thereby fitted to the contemporaneous situation.

The porphyry base relief of the Column of Constantine in the Constantinian forum of Constantinople (A.D. 328), which originally bore the gilded colossal statue of Constantine-Sol, is known through Melchior Lorch's drawing of 1561. An *imago clipeata* of Constantine is flanked by two Victories, who escort young men offering gifts to a female personification (Rome or Constantinople) beneath the clipeus of the emperor. At the tips of the wings are an Eastern barbarian and a German.

The reliefs of the base of the Egyptian obelisk set up by Theodosius in the Hippodrome of Constantinople date from about 390. They are distributed over an upper, almost cubical block and a lower, narrower block. The four faces of the upper block exhibit public ceremonies in the Hippodrome (PL. 57; II, PL. 467; VII, PL. 265); Theodosius and Valentinian II, Arcadius and Honorius, all appear standing or seated on thrones in the imperial box high above the arena. Flanking this dominant central group are bodyguards, senators, and officials; and below are varied scenes of the crowded Hippodrome, among others, the offering of gifts to the rulers by barbarian peoples and the appearance of singers and dancers before a large crowd. The lower block bears reliefs on two sides — one a race scene, the other showing the erection of the obelisk. The historiated column of Theodosius in the Forum Tauri in Constantinople, only a few fragments of which have been preserved, is datable about 386–94. Of the same type as the columns of Trajan (VII, PL. 263; X, PL. 152) and Marcus Aurelius (VII, PL. 264) in Rome, it had a spiral relief depicting the battles and victories of the Emperor. Also of the same type was the historiated column of Arcadius, situated in his forum in Constantinople, probably begun in 401–02 and perhaps completed about 421. The reliefs of the spiral and of the base were reproduced several times in drawings (PL. 58), notably those of Freshfield of 1574. The relief of the base of the Column of Marcianus in Constantinople is dated 450–52. On the front of the base are two Victories holding a votive shield; the other faces display a Christogram within a corona.

Compared with the reliefs of the base of the Column of Theodosius of about 390, the fragments from the Column of Arcadius of about a decade later evidence a stiffening of form; the rounded folds of the earlier monument become sharper and the undulating curves less flexible. Even more pronounced in their hard, draftsmanly style are the reliefs of the Column of Marcianus and its base. The sculptural character of the Victories is due essentially to the vigorous contour enclosing the compact, simplified figures. A kindred linearity of form is found in a well-preserved relief Victory in Istanbul (Archaeol. Mus.).

The art of relief also bears witness to the change in taste that has been observed in sculpture in the round. The full volume of forms, the sense of bodily form contained by the garments, and the vitality and tension of musculature, that is, all the classical traits, declined steadily in reliefs as well. The organic development of form and movement was gradually lost, as were the details, in surfaces more and more smooth and generalized. The dark holes and grooves left by the drill, now favored over the chisel, evidence a decided modification in the technique of marbleworking, as true for architectural decoration as for sculpture. In contrast to the chisel, the drill lends itself more to incorporeal and illusionistic effects; rather than strongly molded forms it creates an active surface of luminous edges and shaded furrows. A parallel to the drill technique is provided by mosaic designs, executed about the same time, in which white lines were traced on a black ground; the important element was not so much the essential forms delineated but the changing reflections of light. Rome was the center of this style of mosaics and reliefs, as it was the arbiter in portraiture, and its influence radiated throughout the provinces of the Western Empire.

The history of 3d-century relief after the Severan age is divided into three main periods, roughly corresponding to the phases of development in portraiture. The reliefs of the decade 230–40 are characterized by a restlessness, a nervous excitement, that is revealed in the composition, the pose and movement of the figures, the drapery, and the form of the hair. Lions' and horses' manes, for example, are agitated like windblown flames, so much so that this has been dubbed the "style of the flaming mane." The expression of both men and animals is anguished and preoccupied. This mood of anxiety, and the sculptural manner used to convey it, corresponds to the preferred themes of the time: battles and lion hunts. Moreover, because the sarcophagus itself and the principal relief become taller, the ideal proportions of the classical frieze are no longer retained.

During the ensuing Gallienic renaissance the general artistic temper became quieter. In the sarcophagus reliefs, battles and lion hunts gave way to scenes with philosophers and muses, suggesting that it was not only military and hunting prowess which led a man successfully through life and beyond, but culture and education, the appreciation of art and philosophy as well. Hence the dead are oftentimes represented as philosophers, poets, or others occupied with some spiritual pursuit. A splendid example of this type is the sarcophagus of Plotinus in the Vatican Museums. The philosopher, flanked by two female figures, has a head that is closely related to the youthful Gallienus type in hair style and beard. Since this so-called "Plotinus" lacks the long beard with which the true philosopher is ordinarily depicted, it most likely portrays some dilettante of philosophy who chose to be presented in a traditional philosopher guise. Although their relaxed attitudes enounce the renewed classicism of this phase, the lack of truly sculptural volume and organic form in these figures reveals a lingering tendency toward the characteristic late-antique taste. The conventional frontality of the focal figure at the center and the symmetric deployment of the subsidiary personages about him is also typically late-antique.

The earliest Christian sarcophagi — those of La Gayolle, the Via Salaria (Vat. Mus.), and S. Maria Antiqua — are commonly ascribed to the time of Gallienus, on the basis of both style and iconography, for they partake of an artistic tendency seeking to regain the effect of full-bodied mass and, like contemporaneous pagan sarcophagi, they favor the philosopher type as their central motif. Their relaxed and balanced figures follow classical models and are freed from the unitary group and the background elements. As in pagan sarcophagi, the seated philosopher is shown in the act of teaching, holding a rotulus and wearing the pallium. The rotulus, an emblem of philosophy, in subsequent Christian versions of the theme becomes indicative of the Gospel, denoting Christianity as the true philosophy. Such a personification of Christian philosophy is found on several sarcophagi, where the figure is significantly placed between the orant and the Good Shepherd, that is, between the personified prayer for salvation and the symbolic identity of the Saviour. About 300 this image of Christian philosophy underwent a transformation and became that of the evangelical Christ, first encountered on a fragmentary polychrome sarcophagus (Mus. Naz. Romano) from the Tetrarchic period, showing the Sermon on the Mount. The Philosopher-Christ or "Christ as Teacher" — that is, Christ wearing the pallium, carrying a rotulus or book, and in the act of instructing (cf. III, PL. 304) — appeared at this time, going on to become a permanent form in the Christological repertory of later periods. During the persecutions and until the Edict

of Milan, Christian sarcophagus reliefs carried a crypto-Christian language in order to avoid endangering the families of the deceased. Because of their accepted significance in pagan iconography, the good-shepherd figure with a lamb on his shoulders (*humanitas*) and the orant (*pietas*) were frequently adopted as motifs uncompromising to the well-being of the Christian faithful.

As has already been stated, the period from about 207 until 315 was the critical period of transition for ancient art: the classic tradition clearly began to disintegrate, and the late-antique style presaging the medieval tradition developed. The last three decades of the 3d century constituted a period of formal anarchy in the art of relief, as was true also of portraiture. Characteristic examples of this decomposition of form are a series of sarcophagi with Prometheus, Phaëthon, and circus and hunt scenes. The figures have lost their corporeal beauty and are no longer related to each other in natural groupings; interwoven and overlapping, they are no longer organic entities but instead form parts of confused clumps. Contours no longer flow softly and rhythmically but are rendered in angular and broken lines, so that there results a suggestion of disarticulated, marionettelike movements. Markedly disintegrated compositions present an eloquent parallel to the anarchy of the state and the violent social stresses of the time.

Contemporaneously with the collapse of the classical formal tradition, the great classical figural themes, now become seemingly empty and without valid content, also were increasingly abandoned. The reality of the epoch entered its visual arts, with a crowd of motifs drawn from ordinary life in the cities and the countryside. The sarcophagus figures are suffused with an ingenuous narrative *joie de vivre* that deals with life directly and tells simply what is happening, paying no heed to artistic conventions and tradition. The noble classic types are replaced by ordinary men of rough aspect, frequently ugly and grotesque. This widespread manifestation of Roman popular art was foreshadowed by the 3d-century development of strong realistic and anticlassical tendencies. Funerary art turned from the mythological themes of the hunt of Hippolytus or of Meleager to real hunts, with the deceased in the role of hunter; it turned from mythical battles to historical ones, with the deceased leading in the fight. In other words, there occurred a gradual Romanization of figural themes originally of Hellenistic character, as well as an association of them with the contemporary situation.

Even the earliest Roman art revealed a strain of popular realism that remained relatively untouched by classical influence; but such expressions had always been restricted to the most simple, utilitarian art forms and were not found, for example, in the craft of the funerary carver. The new situation characterizing the period under discussion (ca. 300) was that this popular inclination became the state style, which set the general tone and found expression on such official monuments as the Arch of Constantine. The reason for this lay in the great social changes effected during the 3d century, and then stabilized by Diocletian's sweeping reforms, through which a new class rose to power, a ruling class made up of elements that had always been inclined toward artistic expression conventionally termed "popular."

Similarly, in Christian art there took place in the post-Gallienic period an all-encompassing transformation, both in style and subject matter, marked by the appearance of a popular narrative character that sacrificed symbolism in favor of factual reality. The bucolic paradise that is the appropriate setting for the figures of the orant and the Good Shepherd became a vast natural landscape with scenes of agricultural and pastoral pursuits. Scenes of martyrdom were also rendered realistically (e.g., the sarcophagus lid of Aelia, Catacomb of Praetextatus). In place of the symbolic images of instruction and annunciation, there appeared miracle scenes from the New Testament and, of course, the figure of the historical Christ. And the personification of Christian philosophy was transformed into Christ preaching the Sermon on the Mount.

The new popular, narrative style had its center in Rome, and its chief use was on Roman sarcophagi. The sarcophagus workshops of Greece and Asia Minor declined greatly at this time, while in Trier and the surrounding area the art of relief came virtually to an end in the second half of the 3d century. When their own workshops were closed, Greek sculptors from Asia Minor, Syrians, and perhaps also Galatians came to Rome, where what survived of their tradition was blended into a lively popular art, fusing both Roman and Christian strains. In the course of the Constantinian age, pagan sarcophagi decreased sharply and Christian sarcophagi led the development thereafter.

With the "restoration of form" that set in about 300 — becoming more and more pronounced in the early decades of the 4th century — relief compositions which had been disintegrated in the preceding formal anarchy were again pulled together with a new mechanical order based on parallel placement and symmetry. In two famous reliefs on the Arch of Constantine, the *oratio* and the *liberalitas* (PL. 54), this new ordering was fully developed: the individual figures are not associated in free, natural groupings but are placed in coordinate rows. These files of individuals and the architecture framing them are rigorously subordinated to and symmetrically disposed about the figure of the Emperor, who dominates the center of the relief. The mechanical quality of this order is emphasized by the fact that the axes of the composition are coordinated with the orthogonal elements of the frame; thus, for example, the lines of the tops of the heads and of the feet coincide with or parallel the borders of the composition. At the two ends of the *oratio* each row of figures is closed into a rectangle that parallels the frame. Similarly, in individual figures such as the flying Victories with trophies, the strong influence exerted by the frame over the whole composition is evident. The upper part of their bodies usually follows a vertical axis, while the lower part conforms more closely to a horizontal; the trophy is bent into a curve that is concentric with the lower cornice of the arch. The weaker the organic integrity of the figures has become, the more adaptable are the single parts to the constraint of the frame. Among the numerous post-Constantinian examples of this total subordination of all the figural elements to such a system of coordinates, dictated by the frame, may be cited the reliefs of the Theodosian base of the obelisk in the Hippodrome of Constantinople. The mechanical ordering of form affects even the smallest details; in representations of hair or feathers, of water or stone, there is a schematic repetition of identical component motifs. This abstract regularity is most striking in the rendering of rocks, which are given uniform shapes resembling cakes of wax.

The centralized, symmetrical compositions evolved naturally from the stylistic development in Rome itself, which paralleled in expression but did not derive from a corresponding situation in Eastern art. Western liberation from the classical Greek tradition did signal a *rapprochement* with the East, where a similar transformation had occurred, but not a direct causal relationship.

An important group of early-4th-century sarcophagi is so closely related to the reliefs on the Arch of Constantine that it is reasonable to suppose they were produced by the same workshop. These are the so-called "frieze sarcophagi," which were the dominant form during the Constantinian period. The style has the following characteristic organization: a single register of reliefs or two superimposed registers; individual figures stiffly disposed with respect to each other; alignment of the heads paralleling the upper frame, and the feet paralleling the lower frame; pronounced verticality of the separate figures; and repetition of types almost as if mechanically reproduced in series. Even within this mechanical order, however, their narrative sense is lively. Scenes from the Old and New Testaments — including Adam and Eve after the Fall, the sacrifice of Isaac by Abraham, the healing of the paralytic, the resurrection of Lazarus, the denial of Peter — are treated with the spontaneity and the same sense of reality evident in the scenes of warfare and Roman urban life found in the friezes on the Arch of Constantine and in the preceding popular art. To the Biblical subjects were added the apocryphal legends of St. Peter, but the main theme became the miracle-working Christ. Instead

of the philosopher's rotulus, He carries a *virga magica* betokening His powers; moreover, the philosopher's beard is gone, and the figure of the divine miracle worker radiates an angelic and youthful beauty. Abundant curls, variously arranged, fall about Christ's face. The idealized "Christus heroicus" modeled after divine beings of pre-Christian typology was introduced before the 4th century.

A series of porphyry sarcophagi from Rome and Constantinople are of Eastern type (PL. 55). Battle scenes decorated the supposed sarcophagus of Empress Helena from the mausoleum at Tor Pignattara, which originally was probably intended for Constantine. The sarcophagus of Constantina from the Constantinian mausoleum (S. Costanza) on the Via Nomentana bears figures of vintaging putti, a traditional pagan motif that had acquired a Christian meaning. With the exception of a single fragment, the porphyry sarcophagi of Constantinople are devoid of figural decoration and display only simple Christian symbols.

A reaction against this Constantinian popular, narrative taste was evident as early as 340. Inspired by pre-Christian prototypes, motifs of columns, niches, and trees began to enter or replace the figural scenes on sarcophagi. Instead of tight units of figures distributed over interconnected scenes or in continuous pictorial bands, there are isolated compositions and small groups alternating with niches or divided by columns and trees (III, PL. 304); instead of the flat, strongly outlined figures of the frieze sarcophagi, there is a return to well-rounded ones in lifelike groupings and set within a generous, convincing space. The figures once more acknowledge classical proportions, poise, and ponderation, and the drapery style becomes plastic and softly natural. This style, which approaches the classicism of the time of Julian the Apostate, was to be decisive throughout the second half of the 4th century.

In the course of this evolution new narrative themes appeared; most notably, the Miraculum Christi gave way to the Passio Christi. Christ is seen entering Jerusalem, taken prisoner in the garden, appearing before Pilate, wearing the crown of thorns; but the corporal punishments of the Saviour ordinarily are not represented, neither the torments of the scourge nor the Crucifixion itself. The scenes of Christ's Passion are supplemented by scenes from the lives of Peter and Paul. The stories of Cain and Abel and of Jonah are also adopted as Old Testament analogies for Christ's sacrifice and return from the grave. The subject of the Passion contributes other, more symbolic allusions to Christ's triumph over death: the Cross as *crux invicta* and the crown of thorns as *corona vitae*, since it is through the Passion that eternal victory is achieved. At the same time there was created the image of the celestial enthronement, the "Christus super caelum." The culmination of this development is exemplified by a sarcophagus in the Lateran Museums (no. 171) and the sarcophagus of Junius Bassus in the Vatican Grottoes (II, PL. 282). On the latter, in the reliefs of the principal side, is an enthroned Christ placed among various scenes of the Passion.

In the mid-4th century, there appeared a new type of Passion sarcophagus with Christ in Glory, between Peter and Paul, occupying the central niches and with scenes of the Passion at the sides. The central panel was devoted to a theme that was later to assume great importance, the Traditio Legis, showing Christ giving his *nova lex* to Peter (PL. 63). Gradually the Passion scenes were relegated to the sides, and Christ in Glory dominated the central relief of the sarcophagus. Such scenes appear in the columnar sarcophagi and in the "city gate" sarcophagi, such as that of S. Ambrogio in Milan (PL. 64), in which the gates symbolize the heavenly Jerusalem. Elevated before them stands Christ, flanked by the Twelve Apostles; His right arm is usually extended in the gesture of the Cosmocrator, and with the left He conveys the Law to the apostles. A similar type from this period, especially popular in Gaul, shows the heavenly council of the apostles with Christ enthroned in their midst. The iconographic progression is from the Passio Domini of the 4th century to the Majestas Domini of the Theodosian period. The quality of *majestas* is emphasized by the fact that Christ is invested with the imperial aureole.

The youthful beardless Christ was still dominant in the period of the Passion sarcophagi; a particularly fine example of this type is the Christ Enthroned found on a sarcophagus in the Lateran Museums (no. 174). Related to this type, because of the form of the face and the hair style, is the noted statue of Christ in the Museo Nazionale Romano, which reflects an image of Christ — probably in mosaic originally — widely known at the time. Toward the end of the 4th century the image underwent an important new modification in response to the emphasis on the majesty of Christ, whereby the figure assumed the solemn aspect of the images of Jupiter with beard and long hair.

A child's sarcophagus of the Theodosian period (II, PL. 468), stylistically close to the base reliefs of the Hippodrome obelisk, represents a widely diffused Eastern sarcophagus type and is particularly important for its iconography. On each of the long sides are two flying angels, holding between them a Christogram enclosed in a wreath; on the short sides are pairs of apostles flanking a cross. These angels bearing a monogram derive directly from the flying Victories, holding shields with the portrait of the deceased, on pagan sarcophagi. Among the other late-antique Christian reliefs of the East Roman ambient may be cited an ambo from Salonika (PL. 67) and a relief fragment with a procession of apostles and the Traditio Legis, both of the Theodosian period and both in Istanbul (Archaeol. Mus.); a relief with Christ among the apostles (Berlin, Staat. Mus.); and two fragmentary slabs with Nativity scenes (Carthage, Mus. Lavigérie), from the first half of the 5th century.

The Ravenna sarcophagi (PL. 65; III, PL. 304) dating from about 400 to the early Middle Ages are usually of Eastern type. In these the sarcophagus becomes an architectural construction having the form of a closed temple for the deceased. Intended to be placed in the open, they were decorated with reliefs on all four sides. Their reliefs generally conform to Greek taste — clarity and simplicity of composition, rhythmic balance, and strong suggestion of volume in the figures. Some of these sarcophagi were probably imported, but most of them seem to have been produced by foreign craftsmen who had set up workshops in Ravenna.

Figural sarcophagi of the Ravenna group are distributed over a period of about two centuries, from the late 4th through the mid-6th century. An example of the first phase is a sarcophagus in S. Francesco (PL. 64), with decoration that is closely related to the reliefs of the base of Theodosius. To the early or mid-5th century belongs the important group named after the Rinaldo sarcophagus (PL. 65). Among the later examples, that of St. Barbatianus (Ravenna, Cathedral) may belong to the 6th century. In the 5th and 6th centuries the symbolic Lamb and the peacock displaced the human figures (III, PL. 303). Together with other symbols these animals constituted the sole decoration of the 7th- and 8th-century sarcophagi. As contact with the Greek world ceased, the process of provincialization proceeded at a rapid pace. The barbarian infiltration brought to the relief style a peculiar uncertainty of proportion and anatomy; classical order and clarity, precise outlines and volumes, yielded to seemingly accidental compositions and coarsened figures and ornament.

With regard to bas-reliefs, mention should be made of the doors of S. Ambrogio in Milan (379–86) and those of S. Sabina in Rome (ca. 430), on which scenes from the Old and New Testaments are surrounded by rich borders of acanthus and vine tendrils. The sculptural fullness and ease of the figures on the S. Ambrogio doors is typical of the Ambrosian classicism, as opposed to the somewhat harsh style of the doors of S. Sabina.

Porphyry. The regular mining of porphyry at the imperial quarries of Mons Porphyrites in Egypt, near the Red Sea, ceased in the mid-4th century, probably for military or strategic reasons. From that time, only special expeditions were sent to procure the lustrous purple stone. The Tetrarchic-Constantinian period had witnessed the greatest development of porphyry sculpture. Besides the porphyry groups of S. Marco and the Vatican and the emperor bust in Cairo, there exists a series

of headless statues that very likely belong to this period; these were carved in the East, in the vicinity of Mons Claudianus, where porphyry was also quarried. A colossal togaed statue is preserved in the Greco-Roman Museum in Alexandria. The emperor is seated like a pharaoh of the Old Kingdom on a jeweled cubic throne with a straight back; the over-all form is compact and blocklike, of great force and monumental in effect. A standing statue of a togaed emperor (Berlin, Staat. Mus.), approximately life-size, and a statue in a chlamys (Ravenna, Mus. Arcivescovile), over life-size and also representing an emperor, are characteristic examples of this porphyry mode, severe, cubiform, and of a linear simplicity, which may almost be termed a distinct style. The hardness of the material did not permit fine differentiation of details and thus favored the taste of the time, which was inclined toward forceful, simplified, and compact forms. A magnificent colossal togaed statue in porphyry, which stands behind the Curia of the Forum Romanum, and a related work preserved in fragments in the Vatican Museums may originally have surmounted columns of the great monument erected in honor of Diocletian near the Rostra of the Forum.

It was only during the late imperial age, however, that porphyry assumed its definite significance as a symbol of the imperial dignity. A visage carved in porphyry possessed a superhuman splendor for its late-antique viewers; and for this reason the celestial faces of the angels in late-antique mosaics are often purple in contrast to the white skin of the human figures. Thus porphyry entered the service of the imperial apotheosis, not only for statuary but also in architecture, for the revetment of walls, pavements, and certain items of furniture. It became solely a prerogative of majesty, just as purple cloth was reserved to the imperial wardrobe and the decoration of the imperial apartments. In the palace in the new capital of Constantinople, the emperors were surrounded with porphyry, just as the imperial medallions on the Arch of Constantine were framed with porphyry inlays. The first thing to meet the eye of the newborn son of the emperor was the purple decoration of the *porphyra*, the chamber lined with porphyry or draped in purple for the empress's delivery; from this tradition, the newborn child was called *porphyro genitus*. And after his death the ruler and his family were once again surrounded with porphyry, for it was the material chosen for imperial sarcophagi, some of which have been noted above (PL. 55).

From imperial use, the symbolic significance of purple descended to the Church. Baptismal fonts, for example, were made of porphyry: as the imperial newborn had been brought forth in a purple chamber, so the spiritual rebirth was signified by baptism in or from a purple font.

Stucco. The general economic decline in late antiquity, especially in the western regions, caused increasing difficulty in the importation of fine stone and, along with the deterioration of classical techniques of marbleworking, led to the widespread use of a substitute material, namely, stucco. In order to simulate the more costly material, the stucco was often covered with a thin layer of marble paste. Stucco decoration itself had an old tradition, but in the new economic situation it found new and extended application. Also in imitation of the possibilities of marble, stuccowork tended toward greater relief, even to full sculptural form, and was not limited to subsidiary ornament but was used for the principal figural themes. The fragility of the material and the indifference of later periods to preservation of works in this medium has meant that little of the great quantities of late-antique stucco has survived; however, what remains is sufficient to follow a line of development through the early Middle Ages.

The most important examples of late-antique stucco art are found in Ravenna. In the Baptistery of the Orthodox stucco decoration predominates in the zone of the windows, above the mosaic and stone incrustation of the "socle" zone. The stucco is applied to form a kind of relief architecture, including niches holding saints executed in high relief (PL. 66). In the corresponding stuccoed zone of the Baptistery of the Arians some of the architectural forms — columns, capitals, cornices — are made in the full round. Much later, in the Lombard tempietto of Cividale (mid-8th cent.), stucco sculpture continued dominant in the zone of the windows, with life-size figures of female saints in very high relief around the window niches, which in turn are framed by a stucco architecture of colonnettes, capitals, and richly decorated arches. A comparable development of stucco sculpture is seen in the East during this period. Elaborate architectural decoration in stucco work — with columns, architraves, archivolts, and niches with figures in high relief — is found in the Sassanian Empire and subsequently throughout Islam, where from the 8th century stucco sculpture reached its greatest heights in the Syrian palaces of the Ommiads.

The degree to which stucco sculpture was used as a substitute for stone sculpture in the early Middle Ages is attested by literary sources that speak of *signa* and *imagines* which were "ex gypso." Epigraphs accompanying the sculpture further attest to the connection with the statuary tradition of antiquity. Ambitious religious compositions such as the Nativity, the Passion, the Resurrection, and the Ascension were fully executed in stucco, and painting and gilding of this sculpture was an extensive practice.

Hans Peter L'ORANGE

PAINTING AND MOSAICS. *From Septimius Severus to the era of the Tetrarchy (193–286).* As the administrative and economic capital of a vast empire, Rome was of necessity an influential cultural center as well as the source of governmental directives. A long Hellenistic-Roman tradition conferred an unmistakable character on its art, and this was most pronounced in those works associated with the imperial court and the high officialdom. Typical are the mosaics from imperial villas such as those at Lorium (Vat. Mus.) and Baccano (X, PL. 176), which were too near Rome to permit their august occupants, the Severi (the oldest of the villas at Lorium was renovated by them), to manifest freely the taste they displayed in their African residences, particularly in Leptis Magna (near Homs, Libya), the birthplace of Septimius Severus. Marked changes that came about there had permanent effects on the further development of art, as evidenced by the reliefs on the Arch of Septimius Severus in Leptis Magna (III, PL. 387) and the mosaics from Zliten (Tripoli, Archaeol. Mus.), which range in time from the beginning of the Severan age (circus scene, ca. 200–25) to the end of the 3d century (Seasons mosaic). In these last, all fine detail is eradicated in brightness, and shadow effects no longer serve as darkening elements. Shadow is replaced by areas of heavier, more opaque color that is contrasted with the incandescent palette which is applied broadly to indicate the highlights. These innovations became permanent qualities, adopted by later artists who transformed the background from a simple identifying support for the figures into more evocative treatments of atmosphere, achieving new and fundamental effects characterizing a taste that, although to some degree "unclassical," was certainly not anticlassical.

At Leptis Magna great artists, who unfortunately remain unidentified, imparted new vitality to the Hellenistic style of Alexandria. From the Libyan city it was transmitted to Carthage and its sphere of influence, and eventually to Rome, which in turn transmitted these modes to Gaul, the Rhineland, and other parts of northern and central Europe. From habit long established, Rome was generally responsive to tendencies emanating from the Near East, and at this time developments of major significance were occurring in the Syro-Mesopotamian area, in part synchronous with developments in Africa. The importance of three-dimensional effect diminished constantly, so that the suggestion of mass within the figures was lost and space was conceived as atmosphere rather than measurable volume. The figures themselves, however, did not undergo a complete flattening against the background plane. A typical example is the mosaic of *Dionysus and Ariadne in Naxos* (Antioch, House of Dionysus and Ariadne), which can be dated between A.D. 210 and 220. The passive nature of the background, which no longer indicates a given space but only an atmosphere, is emphasized by the fact that no classical perspective systems are used. The figures are placed in several registers: those farther

away are set on a higher level, and those parts more removed from the viewer are made larger, adopting what is known as "reverse perspective." This perspective system is exemplified by paintings from the so-called "Schola Praeconum" (220–40; Rome, Antiquarium Palatino). It is an even more evident feature in provincial centers such as Dura-Europos, where space, as it is usually understood, no longer exists, nor is the relation between space and figures that was an indispensable part of the classical prototypes made clear, so that some figures, such as those of patriarchs and prophets, seem to be crowded within frames too narrow to contain them. In the Roman ambient proper, however, the quality of defined space survived and was affirmed particularly in pictorial schemes that were imported to Rome. In the triclinium paintings of the Schola Praeconum the architectural elements, which are obviously derived from Asia Minor, divide the space into areas appropriate to the breadth of structure and the movement of the figures, and the same is true of the contemporary depictions of apostles (or philosophers) in the Hypogeum of the Aurelii. The manner of disposing the figures in a single row reveals an Eastern influence, and a rhythmic quality is achieved by alternating the suggested movement of the figures with the static intervals of the light, luminous background, which acquires a spatial vibrancy that has as palpable an existence as the figures themselves.

At this time Alexandria still played a preeminent role in the arts, in perpetuating and transmitting Hellenistic culture. It was from Alexandria that the more traditional North African paintings and mosaics and the Syro-Mesopotamian production derived. A wealth of Syro-Mesopotamian material has come to light, much of it at Antioch, as well as a substantial amount at Apamea (Syria) and fewer examples, of varying quality, in Lebanon. In all these regions, however, the artistic patrimony is limited almost entirely to pavement mosaics. Nonetheless, great innovations occurred within this tradition also; while they were not so pronounced as the developments in Leptis Magna, they were to have an even more lasting influence.

The mosaic panel of *Iphigenia in Aulis* (Antioch, House of Iphigenia; ca. 200–10) reproduces a theatrical scene probably taken from a codex, but with one difference that changes the entire effect of the composition: the temple, or at least that part which is depicted, is seen in a three-quarter view that sharply interrupts the line established by the portico in the background and blocks or displaces some of its components. Since a column of the temple is placed where the third column of the portico would be evident, the temple infringes upon the uniformity of the background and a broken or dual perspective results. In the *Ninus and Semiramis* pavement (Princeton, N.J., Univ. Art Mus.) from the House of the Man of Letters in Antioch, contemporary with the *Iphigenia* panel, the bird's-eye perspective of Ninus's couch is equally daring. This piece is related to the focal perspective of the standing female figure by means of a turn in the orthogonal arrangement of the tesserae of the background. The way the figures in the frieze of the *Battle of the Lapiths and Centaurs* (Antioch, House of the Buffet Supper) are composed of zones of solid color, eliminating all traces of contour lines, recalls Hellenistic antecedents. Since this mosaic dates from about 200–10, it significantly anticipates the painting of the Schola Praeconum of 220–40. The previously mentioned *Dionysus and Ariadne* mosaic in Antioch repeats the tripartite compositional scheme typical of Severan sarcophagi, with thiasos figures in the lateral compartments. The highlights on the drapery, however, especially that covering Ariadne's leg, evidence a decorative, calligraphic transformation which is a distant harbinger of the network of golden lines that was to be adopted in Byzantine art.

There are several interesting elements to note in an Antioch pavement in which small figures of Psyches are depicted pulling Eros's boat (Daphne-Harbie, House of the Boat of Psyches; 210–20): the novel way the figure of one of the Psyches is cut off at the thigh to suggest immersion in water, the delineation of the sea by means of dark streaks on a blue background, the diagonal composition, and the appearance of an iconographic motif that was to become part of the repertory at Dura-Europos to indicate the souls of the dead. Other devices used in figural representations at Dura-Europos are also based on usage at Antioch, such as the way the drowning Egyptians in the Moses cycle of the Synagogue are cut off across the thighs and the way the sea is rendered. Similarly, the artist of the Seasons mosaics at Leptis Magna drew upon prototypes such as the bust personifying luxury (Tryphe) in the House of Menander (Antioch; 230–50), though comparison shows him much inferior. In the House of the Buffet Supper, the rectangular panels with banqueting youths and hetaerae (portico pavement, intermediate level; ca. 260–80) again brought to the East the spaced, monumental figures characteristic of Roman art of the mid-3d century, which in simplified, almost incorporeal form were sketched by the painters of the catacombs.

At Dura-Europos the artistic situation is very different from circumstances in the other localities discussed. The destruction of the city about 256 or soon thereafter supplies a date *ante quem* for its monuments. From a purely visual point of view, it is justifiable to say that the two worlds — East and West — met in the works of Dura-Europos. In addition to the treatment of space, this confluence is illustrated in another sense by the paintings on the ceiling tiles (dated 245 by inscription) of the Synagogue. On these, some of the heads depicted are complete with neck, as is usual in Occidental practice, while others that follow the Oriental manner are without a neck. Also on the ceiling, the motif of an animal encircled with a garland was a decorative device that enjoyed great popularity in the West. On the other hand, the over-all arrangement of compositional elements in the decorations is Eastern. This decorative influence did not come directly from the East but was transmitted through Edessa (mod. Urfa, Turkey), where the sacred Hebrew texts were first translated into Syriac and where the codices used in other communities were made. Presumably the subjects — and more definitely, the style and composition — of the frescoes in the Synagogue (VIII, PLS. 333, 335–37) were taken from these illustrated codices. Whereas the source of the imagery must remain conjecture, there is evidence for the stylistic resemblance in the funerary mosaics from Edessa. These mosaics, though poorer in quality than the frescoes, provide dated documentation for the style: the *Orpheus* mosaic, 218–22; the *Phoenix*, 235–36; and the *Funerary Couch*, 277–78. Heavy dark outlines, frontal poses, and absence of regulated perspective are characteristic of both Edessa and Dura-Europos and confirm the common background. Evidence of contacts with the West is passing and superficial, such as in the Psyches mentioned above, the depiction of the Temple of Solomon, which recalls those found in the Delian reliefs, and the enclosure wall of the temple precinct, which repeats the architectural motifs of the *frontes scaenae* or of the views of the nymphaea so frequent in the East. Yet certain details at Dura-Europos — the gleaming lines of the highlights on David's purple mantle, for instance — are akin to devices used at Antioch and also foreshadow Byzantine art.

The new centers, therefore, from which the late-antique artistic currents emanated were the following cities, themselves receptive to and fertile in adapting innovations: Alexandria and Leptis Magna for the Hellenistic sphere; Antioch primarily, along with Edessa and Dura-Europos, for Syria; and Rome, where the results were particularly fruitful, for the Latin West. New artistic impulses that tended to disrupt the unity of surviving classical traditions were continually being introduced from the East by way of Mesopotamia. When the flow of influence was in the opposite direction, there came into being works such as the mosaics (largely destroyed during World War II) of Bishapur, Iran, in which the Eastern element was confined to details of clothing and local customs that captive Western craftsmen injected in order to Orientalize their schemes and techniques (X, PL. 177). Since these works are assuredly later than the defeat of Valerian, they may be dated between 260 and 280.

Stylistically distinct from regions immediately adjacent, the northern territories of the Roman Empire were permeated with North African artistic influences. Mosaic examples of this northern style exist in various locales: the *Bellerophon* panel in Reims (first half of 3d cent.), the circus scene at Nennig (Luxembourg)

and the mosaic by Monnus in Trier (both ca. 250), and the *Charioteer*, also in Trier and slightly later in date (ca. 265). (The Monnus mosaic and the *Charioteer* are contained in the Rheinisches Landesmus.)

A new pictorial style, that which developed with the earliest Christian monuments, came into being in Rome about this time. More than ever before, didactic purpose took precedence over all other considerations. The fear of idolatry tended to turn the Early Christian artists from the supple and rich classical forms of 2d-century art, with its typical strongly modeled anatomy and wealth of detail; they strove for a figural synthesis that avoided naturalistic anatomical detail, in order to emphasize a spiritual significance in physical qualities. Moreover, the austere idiom of the sacred texts, especially that of the Gospels, where narrative is kept to the bare essentials, could not but encourage artists to seek a concise pictorial style and to eliminate all details that were not essential to the presentation of the narrative. The most significant catacomb paintings (see CATACOMBS) from the beginning of the 3d century, whether narrative or purely decorative, follow such didactic criteria: the Cubiculum of Ampliatus, the Good Shepherd and the Cupid and Psyche in the Catacomb of Domitilla, the Good Shepherd in the Catacomb of Callixtus, the series of the "Cubicula of the Sacraments" in the same catacomb, and the doves in the Catacomb of Praetextatus. The so-called "Greek Chapel" (III, PLS. 93, 95) and the Virgin with the prophet Balaam, both in the Catacomb of Priscilla, and the Multiplication of the Loaves, in the Catacomb of SS. Peter and Marcellinus, may be dated as late as the second decade of the 3d century. The so-called "Cubiculum of the Veiled One" in the Catacomb of Priscilla (III, PL. 94), the Woman with the Issue of Blood in the Catacomb of SS. Peter and Marcellinus, and figures of Christ and Orpheus in the Catacomb of Domitilla may all be dated between 220 and 250. The Susanna and the Elders in the Catacomb of Callixtus should be placed between 250 and 270, and the milking scene in an arcosolium in the Coemeterium Majus about 280.

It should be added that this mode is not the free expression of individual inspiration, of arbitrary and random innovations, that is, the work of untrained painters from the uneducated mass. The development of this painting style parallels cultural and philosophical currents described by Plotinus (205?–70), whose Alexandrian education was further refined in Asia Minor and Persia. As Plotinus explained it in the *Enneads*, form is light and color. He goes on to say that, in reproducing forms, it is not the drawing which establishes the form in space but that the form is made recognizable by its color in the atmosphere, which in itself is light. Since it is the object — or, more precisely, its color — that is seen, it diminishes when it comes nearer to the eye and enlarges as it moves farther away. Absence of detailed drawing, transformation of measurable space into atmosphere, and inverse perspective are the three formal elements corresponding to the Neoplatonic philosophy of Plotinus, according to which the work of art does not have existence as a fact of the purely visual capacity but in the action of the mind, which comprehends beauty in the whole and in the parts. The difference between this conception of art and that of mimesis reflects the essential contrast between the late-antique work of art and a classical or classicistic work.

In manuscript illumination the situation is even more complex. Later codices, surviving in scant numbers, and the qualities that can be deduced from contemporaneous paintings and mosaics confirm how great a development this medium must have had in Asia Minor and North Africa during the period in question. Unfortunately, not a single original seems to have survived. This was the period in which the codex began to compete in favor with the scroll, which eventually it was to supplant completely. The area extending from Mauretania to Syria seems to have played a leading part in this development, especially the Christian communities that recognized the advantages of the codex over the scroll for bringing several works together, being more readily illustrated, more easily consulted, and less fragile. Although the codex was extensively adopted first among Christians, it soon became preponderant in the pagan world as well, as evidenced in the works of the 4th century.

It is probable that a whole group of illustrations in the Milan *Iliad* (Bib. Ambrosiana, Ms. F.205, inf.), namely, R. Bianchi Bandinelli's "group B," is derived from a 3d-century Alexandrian prototype. Of similar derivation is the Vatican Ptolemy (Ms. gr. 1291), though some of its elements may be traced to Asia Minor, the place of origin of some herbariums that are reflected in the Vienna (II, PLS. 439, 479) and Naples (Bib. Naz., Cod. suppl. gr. 28) Dioscorides. An Eastern provenance may also be ascribed to the prototypes of the *Cynegetica* of Oppian, written at Apamea (Syria) and dedicated to Caracalla, which are best documented in an 11th-century manuscript in Venice (Bib. Marciana, Ms. gr. 479). Near Eastern, too, were the prototypes of the Octateuch manuscripts, in which the illustrations suggest Antioch as a source; their closest reflection is found in a Vatican Library manuscript (Ms. gr. 747). The Edessa codices mentioned earlier should be remembered in discussing the flow of influence in the manuscript illumination of the era.

From the Tetrarchy to Arcadius (286–408). a. Court style. The paintings of the Temple of the Imperial Cult in the legionary sacellum at Luxor were almost completely destroyed when archaeologists cleared the Egyptian structure beneath them. The paintings are known chiefly from 19th-century water colors that do not permit thorough critical evaluation. Dedicated to the Tetrarchs in A.D. 300, they seem to have been executed in an academic style that was stiff and hieratic, qualities substantiated by the fact that they were produced by workshops attached to a military outpost.

The "Barberini Goddess" (PL. 42), from the old Lateran Palace, having been painted in a niche that was bricked up when the palace became the papal residence in 313, was undoubtedly painted before that event; since it is known to have been patterned upon the statue of Venus placed in the Temple of Venus and Roma after the fire of 307, it must be dated between 307 and 312. The "Goddess" is typical of official painting, the mannered classicism revived in the chromatic style of this period, which remained unchanged for several decades because it was the mode peculiar to the court. This character may be seen in the allegorical figures (or portraits, according to some scholars) and cupids with symbols of imperium that were on the painted ceiling of the Constantinian hall beneath the Cathedral of Trier (III, PL. 387). These may be dated about 326 and are certainly of a higher caliber than the "Barberini Goddess." Painted with long, broad brush strokes, the figures are presented austerely and soberly, with very little stress on detail. The style is even more pronounced in the cupids than in the imposing allegorical figures.

The sumptuous mosaics from the Constantinian villa of Antioch (excavations at Daphne-Harbie; PL. 73) should be mentioned together with these works, for the various novel trends of this period were brought together there in a singular array. The way in which ceilings and floors were divided into decorative panels became so standard that it is almost characteristic of the period; and diagonal panels spanning the corners with decorative motifs also became a common feature. The allegorical figures of the seasons in the diagonals of the Constantinian villa at Daphne-Harbie are highly stylized according to formulas of a rigid classicism. However, the plant motifs are developed in strongly defined and fanciful shapes, deriving from a lively, free synthesis of the styles of the Zliten mosaics and of the earlier *Lapiths and Centaurs* frieze in Antioch (House of the Buffet Supper). The hunting and pastoral scenes of the Daphne-Harbie villa are more closely allied with traditional classicizing canons. In the mosaics of the Constantinian villa, Western culture predominates more clearly than in any other complex at Antioch.

The far-ranging locations of the finds — Rome, Trier, Centcelles (near Tarragona), Carthage, Antioch — indicate that the Roman world had again acquired a cultural and artistic koine, no less significant because it was so closely connected with imperial court circles. Although such official art is usually

designated as "Roman," this conventional usage is accurate only in so far as Rome was the name of the capital of the Empire and its political and administrative center.

b. Rome. As soon as one looks beyond this official sphere, striking contrasts and correspondences, clashes and fusions of the diverse artistic currents may be observed. The sacellum of Dea Roma on the Via della Consolazione, which dated from the early decades of the 4th century, was characterized by paintings firm in composition but weak in execution and full of folk elements, thereby suggesting that their creator was an artist on the periphery of official art circles. The polychrome marble inlays of the Basilica of Junius Bassus are quite certainly imports of great artistic value (PL. 70; VIII, PL. 79). There is no longer any way of ascertaining whether the basilica was built by the Junius Bassus who became consul in 317 or by the senator Junius Bassus, buried in the sarcophagus of the Vatican Grottoes, who died in 359 — if by either of these historical figures — since the dedicatory inscription refers only to the building itself. Moreover, although these inlays have generally been placed in the first half of the 4th century, they are most likely of later origin and are not at all Roman — or, more precisely, are in neither the Italic nor the court style. Distinctly provincial in manner, they should be assigned to the North African sphere; they were not made before the last quarter of the 4th century, and even later dating would be reasonable.

In the aftermath of the Constantinian edict of tolerance (A.D. 313), many changes came about in catacomb painting. The works involved are many, and mention of but a few is made in this discussion: the frescoes of saints in the so-called "Cubiculum of the Five Saints," in the Catacomb of Callixtus; the loculus of Januarius, in the Catacomb of Domitilla; and the poorest of the Eucharistic banquets in the Agape region of the Catacomb of SS. Peter and Marcellinus. All these are works from the beginning of the 4th century and are in a popular vein that affected a classical garb. The paintings in the Hypogeum of Vibia and the Catacomb of the Jordani from the second decade of the 4th century, the orants in the Catacomb of Domitilla (with a grace all their own), the Madonna and Child in the Coemeterium Majus (320–30), which has a solid and monumental aspect, and the orants of the Catacomb of Thraso (III, PL. 97), which were painted some five years later and which reveal some connection with painters trained in the East (probably in Syria), all seem to aim toward removing the distinctive marks of traditional Christian art and assimilating the classicism of Constantinian court art. In this light, it is worth noting again the allegorical figures in the imperial hall beneath the Cathedral of Trier, which present the same classicizing impulses.

Certain works reveal other possibilities for this classical court tradition when developed outside the sometimes inhibiting official ambient. The hypogeum on the Via Latina, a large aristocratic tomb, is an excellent example of such varied strains. Aside from paintings having clear ties with court art and other catacomb painting, this burial chamber has diverse frescoes executed at various times by many artists. Most scholars date these frescoes between about 320 and 350, but some parts may actually be dated as much as half a century earlier. They would, on the whole, be indicative of the new development following Constantine's edict. The decorative arrangement of the sharp-cornered vaults is characteristic of the post-Constantinian era, as are the cupids in the tondos, which were so popular from this time onward. In the panels of the Samaritan Woman and the Resurrection of Lazarus, both dating from about the middle of the 4th century, either the old decorative schemes of the catacombs are enriched by adding new figures or the traditional figures are arranged in quieter, more balanced compositions.

A group of paintings in a catacomb (that discovered in 1955) on the Via Latina provide further examples of the transition. In the so-called "anatomy lesson" the composition used is the Christ among the Apostles motif, as found for example in the Catacomb of Domitilla a little after 350. The subject of Christ with SS. Peter and Paul was here for the first time presented in a monumental context, and this more elaborate composition was soon to find its logical situation in the apses of Early Christian basilicas. The depiction of the crossing of the Red Sea undoubtedly draws upon prototypes taken from illustrated codices, which are also reflected in some of the illustrations of the Ambrosian *Iliad*. The pagan cycles of Hercules and Alcestis (or the death of Cleopatra), in the hypogeum of the Via Latina, belong instead to a more conventional and commonplace repertory of subjects. The same may be said of the paintings in the Hypogeum of Trebius Justus (VII, PL. 218), from the beginning of the 4th century, in which the undeniable virtues of good composition, a sense of monumentality, and a lively observation do not, however, raise the painter above the level of a competent craftsman.

The roughly contemporaneous hypogeum of the Via Livenza gives a good idea of what wholly Roman painting was like during the early decades of the 4th century. Although the compositions are sketchy in execution, they have a monumental effect deriving from a careful balance between figures and space. Thus three-dimensional presentation, which during the preceding decades seems to have been rejected in some circles, was successfully adopted once more and developed in a manner analogous to that observed at Centcelles, for example. The monumentality of the dapifers n the decoration (ca. 330–50; partially Naples, Mus. Naz.) of a house near the Lateran, which may have been an adjunct or even an integral part of the palace, reveals true mural painting of a quality the "Barberini Goddess" does not equal.

It may be said that, in Rome at least, any difference between Christian painting and the pagan official tradition effectively disappeared in the second half of the 4th century. The Sacrifice of Abraham in the Catacomb of Callixtus, the Christ among the Apostles in the Cubiculum of Ampliatus in the Catacomb of Domitilla, the SS. Peter and Paul in the Catacomb of Domitilla, the arcosolium of Veneranda in the Catacomb of Domitilla (III, PL. 98), and the Cubiculum of Leo Officialis Annonae in the Catacomb of the Jordani (all done between 350 and 400) accord perfectly with the development of earlier and contemporaneous pagan decor as documented, for example, by many upper-class houses in Ostia and in outlying areas of the Empire. Just as the tomb of Durostorum (IV, PL. 111; second half of 4th cent.), a garrison town on the lower Danube, is a provincial reflection of the style exemplified in Rome by the dapifer paintings of the Lateran house, so the apostles at Niš (Yugoslavia; anc. Naissus) and Pécs (Hungary), which should also be dated about 360–70, repeat the monumental mass characteristic of the fresco figures in the Catacomb of Domitilla mentioned above. There is also the same mode of forming the hands in relation to the body, which makes them appear as if carved from a single block. Similarly, too, broad strokes of dark green or brown indicate the folds of the white togas and the limbs underneath. The brush is handled boldly, like a spatula for scraping the base substance. This style of painting, unique to Rome and the areas directly dependent on her, reached its apex in the two apostles in the Catacomb of Domitilla.

A survey of the truly Roman painting of this era would be incomplete without mention of the Calendar of 354 (or Calendar of the Sons of Constantine; known from 16th- and 17th-century copies of a Carolingian copy), the only work that transmits the style of Furius Dionysius Filocalus, whose art is known from the inscriptions he made for Pope Damasus I (366–84). Though Filocalus was in close touch with the contemporary taste, his drawing style does not seem as up-to-date as his epigraphy, which represented a new step for this art in Rome. In his draftmanship, he favored motifs and mannerisms of the Constantinian age — presumably, that is, the modes of his youth.

c. Alexandria. At this time, in an area forming a sweeping arc from Mauretania, through the Nile Delta, and on to Syria, there became established a broad artistic koine equally as influential as that of Rome but even richer in its possibilities of future development. The Hellenistic culture that had been the heritage of Alexandria for many centuries was disseminated through these lands with increased force and took on many

new forms and qualities in the process, though the subjects and iconography still derived from age-old traditions. Alexandria itself, however, seems to have disappeared from the cultural scene, as if depleted by centuries of uninterrupted artistic endeavor. A portrait of a woman (Athens, Benaki Mus.) that must surely come from Egypt, and quite possibly from Alexandria, is symptomatic of this new lassitude. The iconographic scheme is one common to portraiture of all ages, but the pose is that used for the allegorical figures in Trier and for orants in the catacombs. The same may be remarked of the painting style, so that this work partakes of the classicizing tendency of the official style during the first three decades of the 4th century. Nor is this an isolated example, inasmuch as this manner of painting — a broad, assured brush technique, rich on the surface but empty and insubstantial in effect — can be seen in much sepulchral decoration of the time. It is found, for instance, in two tombs, both of which are closely related to the above-mentioned Athens portrait: one at Asgfa (anc. Cyrenaica), the other near Ashkelon (Ascalon, Israel). Other noteworthy portraits include one in Würzburg (Martin-von-Wagner-Mus. der Univ.), another in Vienna (Kunsthist. Mus.), and a third formerly in New York (Brummer Gall.); these works (Drerup nos. 26–28) can be attributed to the same hand as a portrait in Paris (formerly Coll. Sambon; Drerup no. 29). None, however, rises above the craftsman level, which proceeded from a strong dilution of the court style in adapting it to provincial circumstance.

d. Syria-Mesopotamia. An exceptional number of mosaics has been found at Antioch. There, in Bath E (330–40), a favored theme of the first half of the 4th century was elaborated in the mosaic representing Ge (Gaea) and the Karpoi: namely, the motif of putti bearing emblems or symbols. These putti recall the chubby cupids of the Trier hall. Wheat stalks protrude from the heavy garlands, with full kernels very like the single grapes of the clusters in the vintage mosaics at Cherchel (anc. Caesarea), which will be discussed below. In the mosaic of *Chresis* (ca. 350; House of the Triumph of Dionysus), the seated allegorical figure has the tall cylindrical form that in the East became a hallmark of the Madonna Enthroned a century later. The large allegorical scene on the floor of the Tomb of Mnemosyne (ca. 380–400), also in Antioch, may reflect motifs from miniatures or, even more likely, from textiles. The archetype was probably not very far removed in time or distance, since it has gradually become clear how active a textile production Syria had in this period. The similarities between the pavement mosaic from the Bath of Apolausis (Washington, D.C., Dumbarton Oaks Coll.), also from the end of the 4th century, and the mosaic pavements of many Early Christian basilicas affirm the origin of the iconographic motifs of the pavement.

Philippopolis (mod. Shahba, Syria) was another active center for mosaics; noteworthy among its works are the *Allegory of Earth* and the allegorical representations of justice (Eutekneia), education (Dikaiosyne), and philosophy (all mid-4th cent.; Damascus, Nat. Mus.), with harmonious composition, a rich palette, and an obvious Hellenistic tradition. Another important center was Apamea, from which the *Therapenides* mosaic (Brussels, Mus. Royaux d'Art et d'Histoire) presents a fusion of the two iconographic sources: a residue of Hellenistic tradition is evident in the architectural setting, but it is accompanied by awareness of those compositions which eliminated all systems of strict perspective and which, despite theories to the contrary, could have derived only from the Iranian sphere. The mosaic of *Socrates and the Wise Men* (Apamea, East Basilica), which like the preceding panel dates from about 350, is among those works, documented also in manuscript illustrations, which have as their subject a conversation engaging several persons. This iconographic type, transmitted to Christian from pagan art, is but one example of an extensive and complex transfer of artistic concepts and devices. The mosaic of the *Birth of Alexander* from Baalbek (Beirut, Nat. Mus.), dated about the middle of the 4th century, testifies to the persistence and assimilation of certain motifs, such as the figure cut off at the thighs to indicate its immersion in water (in this case, in a basin). It is significant that this survival occurred not far from Dura-Europos, where similar figures had been painted about a century earlier.

Mosaic remains in Lebanon are much more modest. The presence of Greco–Near Eastern workshops is indicated at Mount Nebo by a large Dionysiac composition. In Armenia, at Garni, local craftsmen imitated Hellenistic models transmitted to them by migratory artisans, even to the Greek inscriptions. The mosaics of the church of Mopsuestia (mod. Misis; near Adana, Turkey) are clearly related to those of Antioch, understandably in view of the geographical proximity of the two cities. Moreover, Theodore of Mopsuestia, the bishop (392–428) who commissioned the mosaics, was himself from Antioch. These mosaics mark a further point on the route of a cultural development that eventually spread from the Near East as far as northern Europe.

e. North Africa, Sicily, and Iberia. Two distinct stylistic tendencies are to be noted in North Africa (see AFRICAN-ROMAN ART), even though their origins are rather similar: one was derived from a mannered Hellenism undoubtedly Alexandrian, but also evidencing some awareness of Syrian developments; the opposing, more original strain impressed the elegance and grace of Alexandria on a Syro-Mesopotamian base. There was also a degree of influence from Italy and Rome proper. The first trend in painting was midway between the official (or court) style of Rome and its classicizing Alexandrian derivative discussed earlier. To this category belong a portrait in Sousse (Tunisia; anc. Hadrumetum), said to be that of Quintus Ennius; the *Triumph of Neptune and Amphitrite* (I, PL. 28), from Constantine (Algeria; anc. Cirta); the *Toilet of Venus* at Djemila (Algeria; anc. Cuicul); the popularizing mosaic from Lambiridi, which seems to depict a colloquy with a doctor; and the six slaves of Dougga (Tunisia; anc. Thugga). These examples, all from the first half of the 4th century, are but a few of a prolific output.

North Africa has another, quite distinctive strain to offer. The so-called "Dominus Julius" (ca. 350), a Carthaginian mosaic with a composition divided into three registers, presents a balanced narrative form in its juxtaposition of figures that is rarely found elsewhere. This compositional balance reappears in a group of mosaics at Cherchel (Algeria), to which various dates have been assigned but which must be Constantinian or post-Constantinian because of the clothing typical of this period. These mosaics depict scenes of agriculture, vintaging, and the arena, placed in several superimposed registers according to a scheme favored at this time. The figures are conceived as volumes in appearance only, for their suggestion of mass is merely the result of color resonance in light. The moduli of the figures, their interrelation, and their placement in space derive from a basically classical orientation, not pedantically applied, however, but intended as stimulus to new efforts and experiments. In the vintaging scene, for example, the glistening clusters of grapes are transformed into small dark circles with luminous halos, thus translating an observed natural phenomenon into a poetic, ornamental motif.

From this cultural background came the mosaicists who worked on the Roman villa at Casale, near Piazza Armerina in Sicily (PLS. 52, 73; X, PL. 178). There were many artisans involved, and they worked there for a number of years. Some were truly outstanding artists, such as the creators of the *Great Hunt* and the *Hercules* mosaics (PLS. 52, 73). Others, such as the creators of the *Small Hunt* and the festoons in the peristyle, were more aptly master technicians of a highly refined craft. A few, among them the mosaicist who executed the circus scenes in the atrium of the baths, revealed such exceptional individuality as to seem unrelated to the others who worked on the villa. On the basis of style, all the Piazza Armerina mosaics should be placed between 360 and 410 (which accords with historical considerations), even though some scholars have assigned them to the beginning of the 4th century. The later date is supported by similarities with the mosaics of the villa at Desenzano del Garda, which is structurally similar as well.

A mosaic depicting a she-ass nursing two lion cubs (Boston, Mus. of Fine Arts), found in Tunisia, exemplifies the subsequent

development of the same artistic school (which this author believes can be assigned to a single workshop), which was afterward to influence the mosaics of the Great Palace of the Emperors in Constantinople (II, PL. 437; VII, PL. 372). If the Great Palace mosaics were made during the first half of the 5th century, they could very likely be the work of African artisans who had moved to the "New Rome," perhaps in the wake of the Vandal invasions. If they were made a century later, in the first half of the 6th century, as many scholars have believed, they might then be the work of the artistic descendants of such African immigrants.

The mosaics from the contemporaneous villa at Saint-Leu (Algeria; anc. Portus Magnus) are exact counterparts of the Piazza Armerina mosaics. The thematic material of both — the victorious gods, those who challenge the gods, and the triumphs of individual divinities — reflects the pagan revival at the end of the 4th century. Another link with Piazza Armerina is that at Saint-Leu, too, the artists — albeit not so highly skilled — reveal the same taste for opulence and ostentation that was the hallmark of the final outburst of Hellenism. The existence of very strong affinities between the mosaics at Piazza Armerina, others in Africa, and those of Misis, Gamzigrad, and Vicenza should not therefore be discounted, for these works document the new cultural koine of the Theodosian-Honorian age and testify to its broad dissemination.

A mosaic with Eros represented as a charioteer, found at Dougga, deserves particular consideration: the construction of the quadriga, the color fragmentation of the face, and the deliberate rejection of any indication of perspective are all definite points of departure identifying the ambient that produced the artist who did the stone inlays of the Basilica of Junius Bassus. This Dougga mosaic is presently assigned to the second half of the 4th century.

This mosaic school, which had a general effect that was incalculable, exerted strong influence in Coptic Egypt. This explains the affinities to Coptic art evident in another mosaic, that of Gafsa (Tunisia; anc. Capsa), also from the second half of the century and with scenes of the circus. The method of indicating the spectators by means of heads alone, repeated within the arcades composing the sides of the arena, and the outline style itself make this mosaic very like a tapestry cartoon.

The influence of the African mosaicists was also felt in the Iberian peninsula, as may be seen in several impressive mosaics. The circus mosaics found near Barcelona and Gerona (VII, PL. 248) and that from Italica (lost) which was signed Marcel[. . .] and Marcianus — the work of local artists — are early-4th-century examples fitting schemes from which there developed the many later mosaics with similar subjects in Piazza Armerina, as well as in Africa, where they were not at all infrequent. The mosaics from Alentejo, Portugal (PL. 76), evidence equally close relations with North African work and, on the basis of the scaly pattern of the background, should be assigned to the end of the 4th century. The similarity to the mosaics from Saint-Leu in general taste suggests a more direct connection in the cultural origins of the artists. The same antecedents are to be assumed for a more rigid mosaic with Tritons from the villa of La Cocosa (VII, FIG. 453) and *The Hunter Dulcitius* from the villa at Ramalete. At the latter site, however, the mosaic with thick, interlaced festoons is the achievement of an artisan of appreciable stature. These last examples are to be dated quite late in the 4th century. The mosaic signed by one "Felix" from the villa at Tossa (380–400), while extremely provincial, is related both in type and quality to the more modest funerary mosaics of North Africa — a type that is also common in Spain.

The mosaics of Christian structures should be allotted separate treatment, since many factors help to unite them despite the diversity arising from far-ranging and disparate cultural provenances. The uniformity promoted by the Christian tendency to follow the official artistic koine was further advanced by the fact that the Christian hierarchy supervised all artistic activity in religious edifices, dictating norms for the iconographic motifs and their execution that would preclude every possibility of idolatrous contamination. Furthermore, once the Christian architectural forms — basilica, rotunda, baptistery — became established, their decorative schemes also tended to become fixed within clearly defined rules. As a result, variation came to be limited to purely artistic means.

The mosaics of the rotunda of S. Costanza (1337–51; PL. 38) might almost be taken as a canon of Roman official, or court, taste of the middle of the century. Unfortunately, the extensive and fundamental restorations of the rotunda hinder a definitive appraisal of this notable monument and its decoration. The same difficulty occurs with the apse mosaic in S. Pudenziana (late 4th or early 5th cent.; III, PL. 305), where the entire right side is a reconstruction. Under such circumstances, judgment must be limited to stating that the execution may be ascribed to Roman workshops, primarily on the basis of the solemn, rhythmic deployment of the figures within the broad space created by the background buildings. Essential differences between East and West can be pinpointed in a comparison of the female figure representing *ecclesia ex gentibus* (i.e., Church of the Gentiles) in the S. Pudenziana mosaic with the female bust in the roughly contemporaneous *Samson* mosaic in the church at Misis. The latter figure has a strong decorative and pictorial emphasis, fragmenting the volume of the figure into bands of color; whereas in the Roman mosaic of S. Costanza, outline and color have a precise function, restricted to the modeling of the figure and its relation to the surrounding space.

Many decorative themes continued to pass from the pagan to the Christian world: for example, the floral motifs enclosing animals and the squares with animals or flowers at the center, both of which became frequent for mosaic pavements. These were common motifs in the East, whence they spread to Italy; the pavement of the basilica of Aquileia, with a pronounced degree of African influence as well, is one such case on the Italian mainland. These motifs continued at large in both areas of the Empire, as may be seen in the Djemila mosaic with the inscription "Asinus Nica," dating from the end of the 4th century.

The chance, scattered mosaic finds from the Near East make it impossible to locate the leading centers there, and only broad hypothetical conclusions can be formulated for these regions. Discoveries such as the Misis (i.e., Mopsuestia) mosaics suggest a flourishing artistic life in the cities of Asia Minor, especially those along the coast, which may also have transmitted the Pergamene motifs that survived in so many works of the second half of the 4th century. The lower quality of the mosaics from Zkruni and Kaoussie (Beirut, Nat. Mus.), as well as the purely decorative display of the oldest basilica at Kos, all from the end of the 4th century, indicates the existence of marginal production in which the artistic trends of the leading centers became uninspired and devitalized.

Unknown also are the origins of the mosaic artists who worked for the emperor Theodosius in transforming the Mausoleum of Galerius in Salonika into the Church of St. George (PL. 62). All that can yet be said is that they were definitely Eastern-oriented. The over-all figure style, bodies whose corporeal identity is obscured by the broad expanse of robes hanging from the outstretched arms, and an architectural background very like the *frontes scaenae* bring to mind both Syria and Asia Minor. Thus, their immediate artistic source remains a moot question.

Important remains from the Constantinian period in Spain have been found in the mausoleum at Centcelles (near Tarragona; 353–58), which was probably meant for Constans, son of Constantine the Great. The division into concentric circles, the subjects, and especially the manner of execution combine to make the dome mosaics of the tomb magnificent examples of the official court style. Nor was this an isolated example in Spain, for the mosaic pavement with the Muses from Arróniz (Madrid, Mus. Arqueológico Nacional) and the funerary mosaic with a Christ(?) in an attitude of benediction (Tarragona, Mus. Paleocristiano) belong to the same ambient. Although adaptations of Syrian schemata are evident in these works, the solidity of the figures and their relation to the surrounding space are Western qualities.

Some of the North African church and baptistery decorations also fit with the imperial koine, while others have a more decided provincial character. The former type includes the Great Basilica of Bône (Algeria; anc. Hippo), the baptistery of Sbeitla (Tunisia; anc. Sufetula), and the basilica of Cap Matifou (Algeria; anc. Rusguniae), which all seem to derive inspiration from Italy. To the second class belong the mosaic of Valentia in Thabraca and the many Algerian tomb mosaics, as well as the curious late sarcophagus with mosaic inlay from the cemetery of St. Salsa in Tipaza (Tipasa). The last-named work anticipates the mosaic design that was to be widely diffused in Palestine during the next century, for example, as seen in the mosaics of the Beth Alpha synagogue (VIII, PL. 337).

The importance of the Calendar of 354 has already been mentioned. Also from the second half of the 4th century is the Quedlinburg *Itala* (Berlin, Staatsbib., Ms. theol. lat. fol. 485), an original codex usually attributed to the Roman sphere, though it cannot with any certainty be included in the stylistic circle of Filocalus. Either Roman or Alexandrian in origin and of high quality, the manuscript must have been the prototype for the early-5th-century mosaics of S. Maria Maggiore in Rome. The papyrus with the rape of Briseis (Munich, Staatsbib., Pap. gr. 128), of uncertain origin, with its robust and powerful drawing, seems related to the more modest and simple paintings of the Tetrarchic sacellum in Luxor. One series of illustrations in the Ambrosian *Iliad* of Milan (R. Bianchi Bandinelli's "group D") may also hark back to Egyptian — or, more precisely, to Alexandrian — prototypes; this likelihood has given rise to a theory that the whole manuscript was of Alexandrian provenance. The archetypes for the numerous Eusebian Canon Tables, so widely diffused by Constantine himself, also originated in Eastern scriptoria. Finally, there should not be omitted from the list the curious pictorialism of the *technopaignion*, or calligram, a poem written so that its lines fill the shape of a relevant figure or object. The leading practitioner of this style was Constantine's court poet Publilius Optatianus Porfyrius.

f. Other European centers. The 4th-century mosaics with hunting scenes found at the Roman castrum of Gamzigrad in Yugoslavia mark one of the advance points in the spread of artistic tendencies from the Near East to northern and western Europe. This cultural development then progressed to the Po plain, where it left another significant marker in the mosaic of the wild-boar hunt in Vicenza (Mus. Civ.). From these regions the Eastern mosaic workshops carried their activities and influence not to the Danube territories, which were permeated with Roman influence, but instead toward the Rhine, northern Gaul, and even Brittany.

The 3d-century date usually given for the *Philosopher* mosaic from Cologne does not seem justified, since even in the East the treatment of the background as a scale pattern did not occur before the end of the 4th century. This mosaic has definite connections with the *Philosopher* mosaic at Shahba (Syria), not only in subject but also in iconographic details. Moreover, it is known that Syrian craftsmen were active in Cologne glassworks at this time. The Dionysian mosaic in Cologne may be assigned a similarly late date for much the same reason, and because it was laid down over an earlier pavement. The atmospheric scaly background is rendered in light and delicate colors, in which the contours of the figures lose some degree of sharpness. But the provincial rigidity of the figure style is in strong contrast to the continuous flow of light among figures and objects. For much the same reasons, a 4th-century date should be assigned to a mosaic found in Trier (Rheinisches Landesmus.; Süd-Allee, Schaab R.10), though more precise dating remains impossible. Undoubtedly of Eastern inspiration, it is a design composed of four sea shells joined in the shape of a four-leaf clover, a form to be remembered in connection with Byzantine mosaics. The late date for this mosaic is supported by the knowledge that the house in which it was found underwent alterations during the 4th century.

Because of its rarity, it is difficult to fix the date and source of the mosaic found at No. 21 Werberbachstrasse, Trier. At its center is a hexagon with a linear and stylized Medusa head, and this panel is surrounded by a series of hexagonal bands filled with fishes, birds, and plants. The outline curves seem to be inscribed with a compass, a drawing style for which there is no basis for comparison — though this simplicity of line may be partly due to extensive restorations. Only the *Rape of Europa* mosaic in the Lullingstone villa (Kent, Eng.) can be cited as in any way similar, both for its linearity and for its sea-monster motif. The emphasis on strong outlines and the peculiar colors that are somewhat like African mosaics of the period after the Vandal invasions suggest a late date, but for historical reasons no later than the end of the 4th century. The *Mysteries* mosaic in Trier, found in 1950 in what was presumably a collegium (No. 7 Johann-Philipstrasse), is to be dated about 370. Its essentially popular style is not without vitality, but artistic considerations are consistently subordinated to the narrative. Possible influences from northern Italy should be considered.

In Gaul, too, Eastern influences were generally tempered by elements derived from northern Italy. This is evident in a mosaic from Blanzy-les-Fismes (Aisne; Bib. de Laon, Inv. 77A), with a large panel depicting Orpheus surrounded by wild beasts. The *Diana and Callisto* mosaic from Villelaure and the *Apollo and Daphne* of Lillebonne should be assigned to the Constantinian era, because the compositions are divided in a manner reminiscent of those from the Constantinian villa in Antioch. That they appear more rigid and schematic may be either because they are provincial works or because they represent an actual cultural lag; in the latter case, they would be dated a few decades later. A mosaic from Sainte-Colombe (near Vienne) showing the punishment of Lycurgus is contemporaneous with the two just mentioned; whereas the *Battle of Eros and Pan* in Lyons (Mus. B. A.) should be dated much later. Though the subject of the last-named brings the Piazza Armerina mosaics to mind, it is quite different in execution.

The farthest outpost of these artistic currents emanating from the East was Britain. The mosaics of the Lullingstone villa mentioned above are good examples. Mosaics with Eastern subjects are often found, such as that of *Orpheus*, with the peculiar circular iconographic schemes that could only have been based on Eastern prototypes. An excellent example of the latter motif is the pavement at Horkstow (Lincolnshire). The walls of the very early Christian chapel (mid-4th cent.) on the upper floor of the Lullingstone villa were painted with a row of frontal orants, posed with arms upraised; in their attitudes and placement they recall the figures of the Catacomb of Thraso. Their repetitive deployment foreshadows the rhythmic files of figures that were to become typical of Byzantine art. Their painting style — as far as one can judge from the few fragments recovered — also seems to reflect a typically Eastern taste.

Developments in northern Italy require separate discussion (although little has survived there from this period), since the fusion of varied artistic tendencies seems to have been more common and to have had a richer outcome here than elsewhere. The secular mosaics at Aquileia (first half of 4th cent.), those from Oderzo (Treviso; anc. Opitergium), made a few decades later, and those of the villa at Desenzano del Garda (end of 4th cent.) constitute a group that, while it does not resolve stylistic problems, does pose many questions. Many Italic artisans contributed to these works, and influences from Rome and (via Rome) from North Africa are evident. A tendency toward the schematic in composition and a certain concern with volume, sometimes manifested in hardness and woodenness of features, are not necessarily the result of the artist's lack of experience but may sometimes reflect the ambient in which he was trained. Thus, the rigidity of the Dea Roma from the sacellum of Via della Consolazione, mentioned above, may clarify somewhat the mosaic style at Aquileia, where certain popularizing elements are probably the result of a craftsman having absorbed only the surface mannerisms of the official court painting without having grasped its deeper intent.

The North African element is very apparent in the hunt mosaic of Oderzo (Mus. Civ.). This quality is expressed in the richness and modulation of color, in a tendency toward

irridescence that blurs the unemphasized outlines, and in compositional refinements which surpass the usual local standards and which can be associated with a specific place of origin — Carthage. The Desenzano mosaics can also be linked with this strain, although the possibility of some Eastern contribution must be kept in mind.

At least some manifestations of Eastern taste can be explained by the fact that in Italy at this time many Eastern artisans were active, particularly in producing silverwork. Such related crafts, if not the Syrian and other Near Eastern mosaicists themselves, may have brought about the introduction of these elements, which in the course of the 4th century entered increasingly into the production of the Po Valley. Artisans from the mosaic workshops of the Po Valley also crossed the Alps, and evidence of their work is clearly recognizable along the Danube and the Rhine.

From Theodosius II to Justinian I (408–565). The development of the cultural koine that had emerged from the period immediately preceding was intensified during the 5th century. This was the result of two complementary factors: on the one hand, the person of the emperor, his family, and court were imposed upon every aspect of public life, either as patrons or as ideal models; on the other, the Church, growing steadily in influence, gradually came in the West to a position equivalent to that of imperial authority, and secular as well as religious art was permeated with its standards. A constant interaction between these poles — Empire and Christianity — developed, so that the iconography of Christian themes was often inspired by court protocol, and conversely, representations of the emperor tended to assume the gestures and vestments identified with Christ. As a result, most works of art were associated with imperial palaces, official buildings, or the Church. Some of the last-mentioned have survived, but almost all the others have been destroyed.

From the end of the 5th century and throughout the 6th the production in this koine had a particular stamp reminiscent of Hellenistic art, and it can have had only one source: Constantinople. There, in the century and a half since its foundation as capital, artists, scholars, poets, and philosophers had come together from all over that world which had once been Roman, and they came into contact with others from Armenia, Persia, and even more distant places. The Hellenistic civilization of the Near East, the Syro-Mesopotamian civilization, the Alexandrian-Carthaginian civilization, and that evolved in Rome all found a particularly fertile soil in which new life could take root and spread. The resulting civilization — the Byzantine — had nothing eclectic about it, however, nothing of the mixed, but was distinct, independent, and brilliant.

a. Rome and Italy in the 5th century. In S. Sabina, Rome (422), important stone-inlay decorations have been preserved, and of the mosaics there remains the large panel with an inscription flanked by figures representing the early branches of Christianity — the Jewish and the Gentile (III, PL. 314). These static figures, solemn and regal, but not hieratic, have much in common with the same symbolic figures in S. Pudenziana in the continuation of the Roman tradition of sensitivity to volumes and their relation to space. The blue background, against which the figures are set on either side of a luminous gold inscription, is a well-composed space that has a consistency of its own. The same thoughtful composition is evident in the mosaic cycle in S. Maria Maggiore, Rome (II, PL. 283). Here there can be no doubt that the scenes are based upon a manuscript, but they are realized in an independent and original manner that makes them an outstanding artistic creation. The figures in the panels in the nave have rhythm even when they are compressed into large groups, and the rows of red or black tesserae outlining the most important parts of the composition serve to accentuate the design. Coherence is given to the lively color scheme by alternating repetition, and gold is used extensively, often to emphasize certain figures and groups. The space is conceived as a shallow area in which the figures move between the background and the frontal plane. In the scenes on the triumphal arch gold serves as a rich framework for the enlarged miniatures, which, because the transposition was so skillful, have retained the punctilious attention to detail of the originals. These mosaics are an example of a transposition of one art form into another, resulting in an outstanding work in its own right.

The mosaics in the two small apses of S. Costanza, dating from about the end of the 4th and the beginning of the 5th century, also are obviously of Roman workmanship. Finally, the mosaics of the Lateran Baptistery, from the time of Sixtus III (432–40), and especially the large acanthus scrolls on a blue background, are of interest in that they anticipate mosaics made a century later under Justinian for Hagia Sophia in Constantinople.

Contemporaneous painting in Campania, at least that still to be seen, is closely linked to the Roman school, though it is often decidedly popular in manner, as in several catacombs in Naples: the arcosolium of S. Severus in the Catacomb of S. Severus, datable to 408, the slightly later one depicting Theotecnus, Ilaria, and Nonnosa, and the one of Cominia and Nicatiola in the Catacomb of St. Januarius (III, PL. 99), and that of Pascentius in the Catacomb of St. Gaudiosus. The mosaics in the Chapel of Matrona in S. Prisco, not far from Santa Maria Capua Vetere, dating possibly from some decades earlier, have similar characteristics. The tomb of St. Gaudiosus, in the cemetery in Naples named for him, is noteworthy because of its mosaics, though unfortunately they are badly damaged. The clipeus with a portrait bust of Eleusinus in the Catacomb of St. Januarius is close in time and style. The two last-mentioned works evince Eastern influences that relate them to contemporaneous work in Ravenna. It is to be regretted that most of the mosaic decorations produced in Campania at this time — for example, those in the Basilica of Cimitile and of SS. Severino e Sosio in Naples — have been totally lost. The paintings in S. Gennaro extra Moenia, Naples, also belong to the 5th century. The date of the mosaics in the Baptistery at Naples is disputed. These softly modeled mosaics are clearly differentiated from Roman works by the fluid handling of robes. The uncertainty of the date is here accompanied by difficulties in determining the stylistic milieu, even though some contributions from the East, and particularly from Greece, are certain, as was true of the early work in Ravenna.

Similar influences, presumably, also Eastern, are evident in the right apse of S. Aquilino in Milan, in the mosaic of Christ enthroned amid the apostles. This subject, very popular in catacomb painting, is here distinguished by the fluid rhythm of the group, with each white figure of an apostle, alternately set in two different planes, accented against a gold background. The more rigid and sketchy small Biblical scenes recall some of the provincial mosaics in Antioch. The mosaics almost suggest a manuscript prototype, perhaps from Salonika, Asia Minor, or Syria, especially when one notes the differences between the Milanese and the Roman mosaics.

The earliest of the Ravenna monuments, the so-called "Mausoleum of Galla Placidia," identified by some as the Church of S. Lorenzo, was built between 425 and 450. Here a noticeable Hellenistic influence of the type evolved in Asia Minor — by this time perhaps transmitted through Greece — is evident, especially in the mosaic depicting the Good Shepherd, who is shown in a three-quarter view typical of Pergamene representations. Elements of Pergamene Hellenism also appear in the pastoral scenes in S. Aquilino in Milan, where, however, the poses are stiffer and the space more attenuated. Such elements recur later in the Paris Psalter (II, PL. 480), in which they were translated into the brilliant, vigorous idiom of the miniaturist. There are precise similarities between the apostles in the "Galla Placidia" monument and the saints in S. Vittore in Ciel d'Oro, Milan; and for neither can a Roman — or more generally, Western — descent be absolutely excluded. Thus Ravenna, for all its Eastern foundations, did not ignore or abjure certain fundamental Western modes, even in its earliest period.

The degree of traditional derivation in the iconography of the Baptistery of the Orthodox, or Cathedral Baptistery (PLS. 45, 66, 72; X, PL. 441), in Ravenna is a complicated question that would be of only superficial interest in defining the artistic environment. What is relevant in this respect is the intensity with

which the motifs are handled; the clear separation between iconic and aniconic themes; the insistent rhythm imposed on disparate elements; and the narrative continuity without beginning or end, which demonstrates the particular value of a central plan in the interrelation of the structure and its pictorial decoration. The lesson transmitted from the rotunda of the Church of St. George in Salonika (PL. 44) could not be more explicit, and affinities with the modes of form and description of the figures in the small apses in S. Costanza were surely not accidental. Thus, here too the Western element is operative because of its contact with a vital contemporary current that had found expression in Greece.

b. The East during the 5th century. In this period Greece in general, and Salonika in particular, again rose to a position in mosaic art that seems not to have been fully appreciated. An imposing work of the period is Hosios David (Salonika), with its Majestas Domini, datable toward the middle of the century, which partakes of traditions from Pergamon and Asia Minor in the broad, seated figures and the symbolic animals, as well as of a tendency toward chromatic surfaces adapted from contemporary textiles, particularly from those from Syria. A new visual idiom grows out of this fusion, but its ties with Constantinople have not as yet been clarified and cannot be until other finds are added to the mosaics of the Great Palace (VII, PL. 372). It is possible that the Vandal invasions of Africa caused many inhabitants of the region to emigrate, and that the artisans among them chose to go to leading centers with an extensive building activity.

The large area between the sea and Mesopotamia at this time had close ties with Greece, but though it may seem that the stimulus came from Constantinople, this has not yet been demonstrated. The mosaic of the basilica of Shavei Zion (Palestine), which for historical reasons cannot be later than 427, shows a large cross set on Mount Golgotha, pomegranates, and fish; the whole composition exemplifies new representational modes (most pronounced in the handling of the pomegranate and fish motifs), which also appeared in Greece (e.g., church at Klausion). The same may be said of the pavement mosaics found in the Synagogue at Maon (Nirim). Elsewhere, however, typically Hellenistic motifs and representational means are employed — animals and plants that are clearly derived from Alexandria in their modeling and in their subtle and varied colors. A case in point is the Church of the Multiplication of the Loaves and Fishes, in Heptapegon (Tabgha).

A nonfigural trend (i.e, one with purely ornamental motifs) asserts itself toward and after the middle of the 5th century throughout the Greek-Mediterranean and the Syro-Palestinian world and Asia Minor. Good examples of mosaics are those from a house and from the basilica at Epidauros, from the basilica at Lefkadia Nausis, from several basilicas in Kos and one in Samos, from the baths at Serjilla (473), those of the so-called "Glass Court" at Jerash, and those in Casaranello. The broad repertory of decorative geometric patterns, the variety of colors, and the effect of iridescence obtained by juxtaposing colors in narrow rows of tesserae placed so that only the corners touch — these are the characteristics of this production, which had an enormous diffusion.

In Antioch, mosaics in private houses became more common, even though the city seems steadily and progressively to have become more provincial, a sign that other centers were becoming culturally more important. However, the devitalization of schemata and the fossilization of certain types of representations were accompanied by a series of innovations, the value of which cannot be denied. To the first group belongs the House of the Masks (400–25). The mosaic of the Amazons in the House of the Amazonomachy (400–25), however, shows that a work in *opus sectile* (stone inlays) was translated into mosaic. That this was the inspiration of the artist in composing his picture is confirmed by the fact that he seems to have cut up fragments of mosaic of the same color, only to lay them side by side. The scene is thus intentionally and forcibly reduced to two dimensions, without suggesting a derivation from manuscript illustrations or from textiles. The House of the Green Carpet (ca. 450) has one of those monumental allegorical compositions that show how slowly classical sources dried up. In the Hall of Philia mosaics (Baltimore, Mus. of Art.), as well as in the House of the Rams' Heads (450–60), the Eastern world, with its predilection for heraldically affronted animals, is once more interjected into the Western sphere. Especially in the Hall of Philia, the Hellenistic representational tradition absorbs such sources to an exceptional degree into images that are thoroughly descriptive and anything but symbolic. The varied mosaic decoration of the Yakto complex (ca. 460), especially the composition known as the "Megalopsychia," shows a hunt in which the plants, animals, and hunter-heroes are disposed according to a composition synthesized from the schemata of the distant Constantinian era, with divisions along the axes and bisections of angles. The figures are set against a white, scale-patterned background that emphasizes the fragmental and isolated character of each scene. The topographical border is a valuable indication of a continued taste for representations of buildings, cities, and regions. Here, too, the scenes are broken up into a series of many episodes all disposed on the same plane in a "continuous narrative," inevitably recalling the use of this scheme on the columns of Theodosius and Arcadius in Constantinople. The strong preference for long-established iconographic and representational means is balanced by a frank and easy style: one punctuated by incandescent light marking time segments and situations, which cannot be traced farther back than the middle of the century.

The animal frieze in the "martyrium" at Seleucia Pieria, of the Justinian period, has animals scattered on a white, scale-patterned, background — almost as though they were decorative geometrical and floral elements on a rug. The relationship of rug and mosaic is also revealed in such contemporary compositions as the mosaic of the *Striding Lion* (Baltimore, Mus. of Art), or of those in the House of the Phoenix, and in the mosaic of the *Beribboned Parrots* (PL. 76). In contrast, the style that was reintroduced into North Africa after the departure of the Vandals is clearly revealed in the mosaics in Room 2 of the House of Ktisis (500–525). The hunt mosaics in Worcester, Mass. (Art Mus.), and Washington, D. C. (Dumbarton Oaks Coll.), in which the monumental figures of hunters are immersed in the scale-patterned background, mark the exact point at which the late-antique and Byzantine worlds meet. In these two mosaics the influence of Constantinople is decisive.

Apart from the mosaics of Antioch, certain others should be noted: the mosaic of mythological scenes found in a house at Epidaurus, the mosaics of the Palace at Stobi, and those of the House with the Double Apse, also at Stobi, all of the early 5th century. The mosaic at Low Ham (England), with Homeric subjects that undoubtedly derived from the Hellenistic iconography of Asia Minor, is from the middle of the century. Such works are not extensive, probably because the barbarian incursions put an end to such expensive artistic enterprises.

c. Constantinople from Zeno the Isaurian to Justinian the Great. The chief characteristic of paintings and mosaics of this period is the absence of any system of perspective. Since the background (whether gold, blue, or white) indicates atmosphere, the figures are each conceived independently and without a point of reference that postulates a general perspective. Concomitantly, the sense of time is lost and, with it, continuous narrative. As a result, even where scenes could be given narrative treatment, they are scattered about the surface without any representational link. The typical example is the mosaics of the Great Palace of the Emperors in Constantinople (II, PL. 372), variously dated to the reigns of Theodosius I or Justinian, but now generally assigned to the latter period. Groups and figures are scattered in calculated eurythmy on a scale-patterned background that is only rarely interrupted by indications of landscape. The mixing of real and imaginary animals emphasizes the nonrealistic character of the whole, which thus exists outside any logical dimensions (II, PL. 437). There is no perspective, but all the figures are seen in a three-quarter view or in a spiral attitude that makes them seem to rotate on an axis, so that they appear to be enveloped in deep space. The lights and shadows that articulate the figures are given

the greatest emphasis, but in the plants the more pronounced lights and shadows are transformed into decorative motifs by means of a repetitive alternation of tesserae in orderly arrangements. The contours of each image are fluid, rapid, and only very rarely rendered in one strong line, but emerge from the fluctuations of color that describe the figure. The different sources are easily distinguished: the Hellenistic culture of Asia Minor, more specifically Pergamene, in the arrangement and pose of the figures; North African influence in the mosaic technique and in a certain exuberance in the use of color; Persian contributions, coming by way of Syria, in some iconographic motifs, especially in the wide borders with clusters of foliage and human faces. All these elements are enriched and transformed by the great anonymous artist who seems to dominate the Constantinople of Justinian, from which few other mosaics have survived the ravages of time. All that remains of the magnificence of Justinian's Hagia Sophia are a few floral scrolls and some fragments in the narthex, where the gold crosses on a gold ground look almost like intarsia work.

The way in which some of the figures of the mosaic in the Great Palace are drawn points up their connection with two well-known paintings, the icon of St. Peter from Sinai, and the *Madonna della Clemenza* in S. Maria in Trastevere, Rome (XII, PL. 142). The common ancestry of all three lies in the Hellenistic suggestion of mass in a space that has no dimensions, for neither the tympanum above the figure of St. Peter nor the enclosing frame of the Roman painting creates a limitation of space. In the former, the heavy frontality of the saint has something archaic about it in comparison with the mosaics in Constantinople. In the *Madonna della Clemenza* the forward thrust of the angels emerging at the sides of the throne and encircling the central figure (which is the pivot of the composition), in two spiraling movements, repeats a motif frequently used in the mosaics of the Great Palace. Whereas the 6th-century date assigned to the Sinai icon is acceptable, the 8th-century date given the *Madonna della Clemenza* — because it is the date of the frame and inscription — may not be justified, for the frame may well be a later replacement.

The most important group of Byzantine works in the west is in Ravenna. The series includes: Baptistery of the Arians, between 493 and 526; the chapel of the archiepiscopal palace, between 491 and 519; S. Apollinare Nuovo, between 493 and 525; S. Vitale, between 521 and 534; and S. Apollinare in Classe, before 549 (see BYZANTINE ART).

The Italo-Roman tradition, which set the pattern for the works in Campania and Lombardy, as well as in Rome, here manifests itself in the Christological cycle in S. Apollinare Nuovo. This cycle seems to postulate as model an illustrated text that was close in its cultural origins to the one that served as the prototype for the mosaics in the nave of S. Maria Maggiore, Rome, even though the corporal solidity of the figure of Christ seems to be diminished in the less definite modeling that is apparent in all Ravenna mosaics. The same Egyptian currents that had produced the Cotton Genesis (Br. Mus., Cotton Otho. B.vi), the manuscript with the illustration of charioteers (Oxford), and the drawing of Christ and the apostles on the Sea of Tiberias also influenced the scenes of the sacrifice of Abraham and the sacrifice of Melchizedek in S. Vitale (XI, PL. 86), where the setting is clearly reminiscent of the Alexandrian style; the same is true of the Biblical scenes with Jeremiah and Moses and of the four panels with the Evangelists (all in S. Vitale). In the eagle of St. John and in the figure of Christ in the apse there is a chromatic dissolution or fragmentation of surfaces, which supports the theory of an Eastern prototype, thus also explaining that mixture of tendencies that is common to so much of the production of Ravenna. Some of the richness of Constantinople erupts in the use of gold on gold in the halos of the saints in S. Apollinare Nuovo, in the rhythmic disposition of the long rows of saints, in the disregard for the modeling of the body, and in the bright colors of the robes. The taste of Constantinople is most pronounced in the two panels in S. Vitale showing Justinian and Theodora (II, PLS. 440, 446; IV, PL. 18). However, these are part of a traditional development that derives from the reliefs on the base of the Obelisk of Theodosius, and that, in Constantinople at this time, seems to have been superseded by the style represented by the mosaics of the Great Palace. Perhaps this archaism in Ravenna can be justified by the close relation to manuscript illumination.

All these mosaics have one thing in common — a definition of space that is neither incorporeal nor merely atmospheric but presents a shallow space in which the figures are forced to move within the narrow area between the surface and the background.

In Rome a similar but somewhat more Western development may be observed in the apse mosaic in SS. Cosma e Damiano (526–30), in which spatial breadth gives monumentality to the clouds dominated by the figure of Christ (PL. 75; III, PL. 305; X, PL. 178). In contrast, the earliest Annunciation, in S. Maria Antiqua, faithfully echoes the manner of Constantinople, but also conforms to the inevitable Roman monumentality; this preference for architecturally conceived structure underlies such works as the *Madonna and Child with the Donatrix Turtura*, in the crypt of SS. Felix and Adauctus in the Catacomb of Commodilla.

The trends in the East were very different. One reveals a predilection for decoration consisting of ornamental motifs with dense and intensely chromatic designs similar to those of textiles. This may be seen in the mosaic pavement of the court joining the churches of St. John, SS. Cosmas and Damian, and St. George, in Jerash (ancient Gerasa), all from the end of the third decade of the 6th century, as well as in the Church of St. John in Ephesus and in the church at Machouk, near Antioch.

Another tendency was an emphatic outlining of forms. This reaches an almost classical equilibrium in the rich and varied decoration of the sumptuous late-antique house at Agros (Greece), from the beginning of the 6th century. The same quality may be seen in the contemporaneous pavements of the Beth Guvrin Villa (Israel), but in Palestine the manner is accentuated to the extreme, as in the Beth Alpha Synagogue. The same preference for outlines is evident in some of the topographical mosaics with cities, such as those in the Church of SS. Peter and Paul in Jerash, which may be thought of as antecedents for the later, large "geographical" mosaics, such as the one in the Church of St. John at Madaba (III, PL. 494).

The style of Constantinople, translated into popular idiom, or rather transmitted by provincial centers (as Antioch was by then), was reintroduced into Africa after the Byzantine reconquest. The resultant works, such as the mosaics in the Baptistery of Kélibia, represent an attempt to assimilate the new culture. Other works are provincial echoes of Constantinople, for example, the mosaics in Gasr-el-Libia (ancient Theodorias) and of the Cathedral of Cyrene (Libya).

The great mosaics of the Justinianic period were also an inspiration to the Arabs, and the mosaics in the Great Mosque, Damascus (II, PL. 441; VII, PL. 407; VIII, PL. 145), and in the Dome of the Rock, Jerusalem (VIII, PL. 146), built during the Ommiad rule, derive from them. The Arabs took those schemata with them to Spain, where the effects survived even into the 9th century, for example, in the Church of Santullo, Asturias.

d. Manuscripts. It has been shown that illustrated manuscripts played a major and determining role in the development of contemporaneous mosaics. Fortunately, from the 5th century onward, original codices have survived that are of high enough quality to permit detailed stylistic analysis. The most important are the Vatican Virgil (Vergilius Vaticanus; PL. 78) and the "Roman" Virgil (Virgilius Romanus; Vat. lat. 3867), both dating from the end of the first quarter of the 5th century, and the Terence (Vat. lat. 3868) from the middle of the 5th century. The *Iliad* (Milan, Bib. Ambrosiana, Ms. F.205 inf.), which some date to the Justinianic age, should be dated to the end of the century. The fragment of a poem with the illustration of charioteers from Antinoë (Oxford, Johnson Coll.) can be dated about 500 on paleographic evidence, and the same is true of the scroll with the illustration of Christ and the

apostles on the Sea of Tiberias (Florence, Bib. Laurenziana), which has the same origins. Important manuscripts of the Justinianic age are the Dioscorides in Vienna (ca. 512; Cod. vindob. med. gr. 1) and in Naples (Cod. suppl. gr. 28), the Cotton Genesis (Br. Mus., Cotton Otho. B.vi), and the Vienna Genesis (PL. 79). The Rossano Codex (Rossano, Mus. Arcivescovile), the Sinope fragment (Paris, Bib. Nat., Suppl. gr. 1286), and the *Christian Topography* of Cosmas Indicopleustes (Ms. Vat. gr. 699) are all from the 6th century.

The Vatican Virgil, which stands out even among these superior works, is attributed to the pagan Roman milieu around the Nicomachi and Symmachi (see below, MINOR ARTS). The style is compact and consistent and the compositions well balanced, qualities usually considered the hallmarks of the Alexandrian school. The Terence is also from Rome or Latium and belongs to a highly cultured milieu, whereas the style of the "Roman" Virgil is more popular. The origins of the Ambrosian *Iliad* are as uncertain as its date. In some respects it seems Eastern and in others more Western, in the line of descent from the Vatican Virgil. The attribution of the Cotton Genesis to Alexandria is certain. The fragments — the one with the charioteers in Oxford and the one in Florence — are both works of considerable quality and indicate how great an influence manuscripts could exercise on mosaics and wall painting. There are also well-founded reasons for assigning the Cosmas Indicopleustes to Alexandria. Constantinople was almost certainly the home of the Vienna Dioscorides. This manuscript was dedicated to Juliana Anicia, and even its dedicatory miniature has decidedly Eastern characteristics.

Michelangelo CAGIANO DE AZEVEDO

MINOR ARTS. Late-antique minor arts were predominantly — there were notable exceptions — the reflection of imperial patronage. Not only coins and medallions, which were as a matter of course regarded as imperial propaganda, but cameos, gems, silver dishes, carvings in ivory, glass, and, no doubt, textiles, all bore the imperial image or witnessed imperial benevolence. Although the surviving evidence suggests that Christian forms of art were established rapidly after the rise of the religion (for example, in Dura-Europos and Palmyra), and although it is known that from the beginning members of all classes of society had been attracted to the new faith, it is clear that, in order to raise the status of a creed so recently regarded as seditious, the driving force of imperial recognition was necessary. Only with the 4th century is it possible to begin to chart with any consistency the effect of aristocratic patronage on Christian sarcophagi, to note the intensive (and therefore undoubtedly imperial) building enterprises that entailed a proliferation of church decoration and furniture, and to see open devotion demanding icons, carvings in ivory, and Christian silver marriage caskets. The sign of the new era had appeared in the vision of Constantine before the Battle of Milvian Bridge (312), and the seal was set by his mother Helena's finding of the True Cross (ca. 327). Christianity was to confirm that which the imperial cult had predicated: the proper subject for art was not the precise notation of matter nor a summary evocation of the ideal, but a deliberate statement of the Intelligible Being — either as God in the human form of Christ, or as the Vicar of God in the person of the emperor. There were, of course, artifacts on different levels; and works of art executed for the pagan aristocracy in Rome were of comparable quality with those commissioned by the Christian court. In the late 4th century, however, pagan allegories and mythological subjects began to look academic and uninspired.

Coins and medals. The seeds of the style called "late-antique" are already to be seen in the coinage of the late 3d and early 4th centuries. The medallion equivalent of five *aurei* with a representation of Diocletian and Maximian, dating possibly from the year 287 (Berlin, Staat. Mus., Münzkabinett; Schlunk, 1939, pl. 1, no. 1), reveals that classical standards of proportion were being abandoned. Although the heads are depicted with the intention of verisimilitude, shoulders and hands have shrunk to a degree that would have been considered barbaric by a Hadrianic or Antonine connoisseur. From this time begins the gradual disintegration of the ideal forms postulated by the Greeks and the moderately precise statement of fact demanded by the Romans. Generally speaking, the heads on the Tetrarchic coinage still preserve this Roman interest in realistic representation. Diocletian (PL. 90), of lowly Dalmatian stock, Maximian, a Pannonian peasant, and Galerius, the son of a shepherd, are in no sense idealized. Their rugged features, closely cropped hair, and stubbly beards are presented factually and contrast forcibly with heads on some of the coins of Constantine, such as those, struck possibly in about 326, based on a portrait of Alexander the Great (Schlunk, 1939, pl. 1, no. 4), and with some of the coins of Constantius II (Toynbee, 1944, pls. II, 15; VI, 3; XX, 2; XXXIV, 1, 2; XXXV, 3). From the time of Constantine, realistic portraits are rare. Although it is possible to detect differences of physiognomy in the sequences of imperial coins, the image is usually depicted with an exaggeratedly youthful face and with hair curling over the nape of the neck and combed over the brow; rank is denoted by the imperial diadem and various attributes of power. Julian the Apostate (361–63) and, later, Eugenius were represented with beards, but, in spite of the Emperor Julian's retrograde tendencies, there was no attempt to return stylistically to the standards of the Antonines or of Augustus. A small gilt bronze bust of Valentinian II (375–92) or of Gratian (H. Peirce and R. Tyler, 1932–34, I, pl. 50a), from a private collection at Pécs (where after 375 Roman domination was weak) and now in the National Museum, Budapest, shows the continuity of the Constantinian models. But to return to the coins, it must be emphasized that quality does not necessarily vary with the metropolitan position of the mint. Coins struck in Antioch may be better than those from Constantinople; and even as late as the reign of Leo I (457–74), the coins minted at Salonika were superior to those of the new Rome on the Bosporus.

In spite of the disintegration of classical canons, there can be no denying the beauty of the majority of late-antique coins and medallions, such as that issued by Constantius II at Constantinople between 333 and 335, now in Vienna (Gnecchi, 1912, I, p. 30, no. 10); the medallion of the same emperor in a fragment of a gold girdle, dating possibly from the 5th century (Baltimore, Walters Art Gall., 1947, no. 421); the *aureus* of Valentinian I, issued at Constantinople between 364 and 375 (London, Br. Mus.); the medallion of Theodosius I (Washington, D.C., Freer Gall.; Toynbee, 1944, pl. XXXVI); and a medallion of Galla Placidia, from about 420 (Paris, Cab. Méd.; Peirce and Tyler, I, pl. 88b). Medallions and coins such as these were regarded at the time as works of art and were frequently mounted in gold to make bracelets, collars, and girdles. They served as models for the jewelry of the aristocracy, for example, the early-5th-century wedding ring of Aristophanes and Vigilantia from Rome (Washington, D.C., Dumbarton Oaks Coll.; *Handbook*, no. 166). But after Arcadius (395–408) the decline was rapid. Coins were badly designed and indifferently struck — although the image of the Empress Licinia Eudoxia is not without barbaric charm (cf. Delbrück, 1933, pl. 24, nos. 4–6) — and in spite of the great medallion of Justinian (lost) issued to celebrate the victory of Belisarius in 535 (Toynbee, 1944, pl. XLIV), the later sequences amount to little more than pictographs of imperial power.

Contorniates — coinlike pieces not issued to circulate as currency — were probably used in Rome as games counters. Of indifferent quality, struck with pagan legends or with portraits of emperors noted for their interest in the circus, such as Nero and Hadrian, these medals were produced for persons lacking in culture or refined taste. Nevertheless, an attempt has been made to establish such artifacts, ranging from the 4th into the 5th century, as pagan propaganda distributed during the New Year games by a group of Roman aristocratic families obstinately clinging to the old gods. But references to the New Year are scanty on the contorniates; and the illiterate inscriptions, slipshod technique, and rough facture make it unlikely that pagan families such as the Nicomachi or the Symmachi would have sponsored such an enterprise. Nor is

there any real evidence that the contorniates represent deliberate anti-Christian propaganda.

Jewelry. Jewelry, even when it was not made up from coins and medallions, was likely to bear the imperial portrait or to stress rank. Thus, a gold brooch with three small pendent crosses (found at Ténès, Algeria) bears a frontal portrait of an empress, identified with Galla Placidia, and dates probably from the first quarter of the 5th century. The cruciform fibulas, all gold, from the same treasure (Heurgon, 1958, pl. II) were used to pin the chlamys at the right shoulder; they represent part of the uniform of the higher ranks of the army and of the imperial bureaucracy. It is known that there were strict rules governing the type of fibula worn: those decorated with precious stones were reserved for the use of the emperor, and the pinning of the fibula to the chlamys by the emperor became an important act of investiture. Belt ornaments, buckles, and bracelets, as represented in the Ténès treasure, suggest that by the early 5th century jewelry worked in an *à jour* technique had become fashionable. The gold is pierced to show patterns of interlace, small birds in vine-scrolls, or more complex figural scenes, as in a gold buckle, found at Coudray (Oise), which is in the Collection B. de Montesquiou-Fezensac (Heurgon, 1958, pl. XIX). On the other hand, bracelets and collars may consist of simple twisted strands of gold, ending in knobs or filigree. Earrings may combine many techniques — *à jour* work, filigree, plaited strands of gold, with or without precious stones; but typical of the period are those decorated with jewels or pearls suspended at the ends of gold strands, varying in number between three and five (for necklaces of this type, cf. Schlunk, 1939, pl. 15, no. 73; pl. 24, nos. 97 and 98).

Glyptics. Late-antique cameos and gems may be regarded as expressions of the personal taste of the emperor. Constantine the Great was particularly fond of giving them as presents, and the majority of surviving late-antique cameos were made for him or for his family (cf. Delbrück, 1933, pl. 73). The sequence begins, however, with a beautiful chalcedony cameo carved with the busts of Diocletian (284–305) and Maximianus Herculius (286–305), in the Dumbarton Oaks Collection (*Handbook*, no. 210). The most famous, the Rothschild chalcedony cameo (VI, PL. 40), has been identified as either the portrait of the emperor Honorius and the empress Maria or that of Constantius II and his empress and has been attributed to a Constantinopolitan workshop of about 335. Apart from imperial portraits and scenes of apotheosis, there may be represented battle scenes, as on the superb fragment in the National Museum in Belgrade (G. Bruns, 1948, p. 19, fig. 14), and Christian subjects such as the Good Shepherd (Schlunk, 1939, pl. 18, no. 180).

The carving of gems, largely confined to the imperial portrait in choice of subject (PL. 90), follows closely the style of the coins, as in the fine amethyst intaglio engraved with a bust of Constantius II in the British Museum (H. B. Watters, 1926, no. 2032; Delbrück, 1933, pl. 74, 2). A sapphire intaglio in the Trivulzio Collection in the Castello Sforzesco, Milan, depicting Constantius II spearing a boar (*ibid.*, pl. 74, 1), should be compared with gems bearing his portrait in Boston and Leipzig. A jasper intaglio with a representation of Mars and Venus, in the Cathedral Treasury at Cologne (Peirce and Tyler, 1932–34, I, pl. 9), may be slightly earlier in date than the gems engraved for the Constantinian house. An engraved sardonyx of Romulus (Leningrad, The Hermitage), which represents the emperor Honorius investing the young Valentinian III as Caesar in the presence of his father Constantius III, may be dated about 423 (Delbrück, 1933, fig. 73, and pl. 111, 1). The style of this gem is a great deal coarser and more summary than those of the 4th century.

Carvings in rock crystal, almost certainly executed in Egypt, are extremely rare. A series of bowls, fish, and a miniature temple in this technique are in the collection of Mrs. W. H. Moore, New York (Baltimore, Walters Art Gall., *Catalogue of Early Christian and Byzantine Art*, nos. 536–40); but the finest of the rock-crystal carvings is a statuette of Hercules and the Erymanthian boar (PL. 89), dating probably from the early 4th century (*ibid*, no. 534). A statuette of a lady of the imperial house — represented without a diadem, however — in the Freer Gallery, Washington, D.C. (Dennison, pls. LIII, LIV), is coarser in quality. A fragment of an armored torso in the Louvre (Pierce and Tyler, 1932–34, I, pl. 7) and the head of a lion in the Musée de Cluny, Paris (*ibid*, I, pl. 17), would seem to date from the early 4th century.

Among carvings in agate, also very rare, the magnificent "Rubens Vase" (PL. 88), decorated with large vine leaves, grapes, and two heads of satyrs, has been assigned to Constantinople and dated about 400 (Baltimore, Walters Art Gall., *op. cit.*, no. 543). It should be compared with the Waddesdon Vase, carved in agate with spreading vine-scrolls, acanthus leaves, and heads of Pan, which is in the British Museum (C. H. Read, *The Waddesdon Bequest*, 1902, p. 32, no. 68, pl. 17); the "Rubens" may be slightly earlier in date.

Silverwork. The great sequence of silver dishes and other vessels of the late-antique period start with Constantius II. Two dishes found at Kerch (Leningrad, The Hermitage) refer to an anniversary of Constantius in 343. The style of these dishes and that of a third, with a representation of a mounted emperor preceded by a Victory and followed by a soldier, is provincial. Scholars have hesitated to assign them either to Constantinople or to Rome; a workshop in the Black Sea area has been suggested (cf. Matzulewitsch, 1929, pls. 23–25). Constantius celebrated his anniversary in his favorite city, Antioch; but if the standards of its mint are considered, it would seem unlikely that Antioch was the source of the dishes. Works in a provincial style are not unknown in Constantinople during the period from the founding of the city until the outbreak of iconoclasm (726), and it may be that these *largitio* dishes were made there. The imperial sequence continues with the silver dish of Valentinian I (364–75), found in the river Arve near Geneva (Mus. d'Art et d'Histoire; Delbrück, 1933, pl. 79). On the dish the emperor is represented standing; a Victory flies toward him from the left, and he is accompanied by six soldiers. The silver is badly rubbed, and the face of the emperor has at some time been covered. It seems reasonable to suppose that this dish was made in Rome. The third, and most splendid, piece of this type is the Missorium of Theodosius I (II, PL. 487), which celebrates the Decennalia (388); found in Estremadura, it is in the Real Academia de la Historia, Madrid. One of the key pieces of late-antique style, it was to be copied by Byzantine silversmiths in the early 7th century. Scholars differ over the situation of the workshop: Rome, Constantinople, and Salonika have all been mooted. The missorium shows the emperor Theodosius I seated before an arcaded screen between his nephew Valentinian II and his son Arcadius. The imperial family is flanked by bodyguards, and the emperor is in the act of presenting a diploma to an official. In the lower field a reclining figure of Earth, or Abundance, holds a cornucopia, and five Erotes lift the fruits of the earth toward the emperor. The supernatural aspect of the emperor is emphasized by depicting him twice the size of his guards and of the official receiving the diploma. The soft contours of the imperial face seem embalmed in eternal youth; the slim figure leans forward out of the plane in which his nephew, son, and guards are set, seemingly to hypnotize the beholder. The seated Augusti no longer appear to sit; they float above their stools and hover delicately in space. Their robes ripple over softly defined forms. There is no longer a precise statement of function: hands no longer grip, and the manner in which Earth holds the cornucopia is ill-defined. The intent is to portray not so much a historical event — the bestowal of a diploma at the time of the Decennalia — but a vision of imperium not wholly of this world, an epiphany of the Vicar of God.

Late-antique art constantly expressed a fusion of authorities and traditions — scholarly meditation on the antique, the stressing of imperial might, the perception of a new religious scheme. The change in esthetic vision had already been proposed by Plotinus: art should be a point of departure for metaphysical

experience. Theories such as these favored Christianity, but for some time the old pagan cults were ranged beside the new faith. The Corbridge Lanx, from the Collection of the Duke of Northumberland (on loan to Br. Mus.), presents Ortygia-Delos as a cult center of the gods Apollo, Artemis, Athena, Leto, and Leto's sister, the local goddess Asteria. The last known official sacrifice to Apollo at Delos was made by Julian the Apostate before his unfortunate Persian war, which began in 363, and the Corbridge Lanx dates very likely from about 360. Also probably to be related to Julian the Apostate, from about 360, is the remarkable octagonal silver-gilt dish with scenes from the youth of Achilles, made by Pansylyppos in Thessalonika and found with a large hoard buried at Augst, once the fort Augusta Raurica and also once a base for operations against the Alamanni by Constantine II and Julian (354–61). In addition to 168 silver coins (Diocletian, Constantine I, Constantine II), 17 large medallions (Constantine I, Constans, Constantine II), and 3 silver ingots bearing the stamp of the Gallic usurper Magentius (350–53), the hoard contained a circular silver-gilt and niello dish showing Erotes fishing in front of a walled town; a rectangular silver-gilt and niello tray with Dionysos, Ariadne, and a satyr and a similar dish with the mark "Euticius Naisi" (of Niš, or Nish); a silver candelabrum; a statuette of Venus; dishes, bowls, cups, spoons, and one small eating implement with the "Chi-Rho" monogram. Among the silver vessels dating from the third quarter of the 4th century and into the 5th, there is a remarkable sequence of pagan and Christian subjects: the marriage casket of the Christians Projecta and Secondus (PL. 86), the Venus trulla, and four silver statuettes that personify Rome, Constantinople, Alexandria, and Antioch (all part of the Esquiline Treasure, Br. Mus.); the Parabiago dish (Castello Sforzesco, Milan), showing Cybele and Attis, in a chariot drawn by four lions, and their cortege; the reliquary casket in the Church of S. Nazaro Maggiore, Milan (PL. 81); the so-called "Personification of India" (Istanbul, Archaeol. Mus.); and a dish with Artemis and a stag (Berlin, Staat. Mus.). Included in this group is the treasure of Traprain Law (Edinburgh, Nat. Mus. of Antiquities of Scotland), with a dish showing a Nereid riding a sea monster; a flagon with Dionysiac scenes; and another depicting the Fall of Man, Moses Striking the Rock, the Adoration of the Magi, and what appears to be the Betrayal in the Garden. The magnificent Oceanus dish and two Dionysiac platters from Mildenhall (Br. Mus.) and the Cesena dish, found with a Gothic coin of Theodoric (454–526), are further examples. It seems probable that most of this silver was made in Rome.

A silver vase with Bacchic scenes and other vessels found in Syria (Cleve. Mus.), have been described as "Byzantine" and assigned to the 4th century. It is probable that an amphora, decorated with an Amazonomachy, hunting scenes, and Nereids on sea monsters, found at Concesti (Leningrad, The Hermitage), was also made at Constantinople in the early 5th century. By this century some Byzantine silver was stamped. A vase with mythological reliefs (Moscow, the Kremlin, Hall of Arms), dating from the 5th century, is stamped with the tyche of Constantinople. A series of vessels bears the control stamps of the emperor Anastasius I (491–518): a trulla with Nilotic scenes and the dish of Bishop Paternus (ca. 518), with alterations made at Tomi (both Leningrad, The Hermitage); a plate from Sutton Hoo (Br. Mus.); and a plate with a niello cross (Bulgaria, Razgrad Mus.).

Other centers are known to have produced silver vessels in the late-antique period. Probably among such local production was the Carthage Treasure (Br. Mus.), some of which is decorated with pastoral and animal scenes, including a dish bearing an inscription referring to the Cresconii, a well-known North African family. A silver ampulla found at Ténès, Algeria, decorated with the Christian monogram framed by a garland of laurel leaves, is probably a Carthaginian work dating from the first half of the 5th century. The silver dish of Aspar Ardabur (PL. 87), dated 434, and the "Capsella Africana" (Vat. Mus.) bear Carthaginian control stamps; and in the 6th century this series was continued with a silver plate decorated with a Nereid riding a sea lion (Turin, Gall. Sabauda; 534–542, or 557), and the "Shield of Gelimer," the Vandal king who was overcome by Belisarius in 533, and the "Shield of Hannibal" (both Paris, Cab. Méd.). A series of silver dishes containing medallions with scenes from the story of Ino and Melikertes (Athens, Benaki Mus.) may be representative of Alexandrian work, since they are presumed to have been acquired in Egypt. These include the Berlin dish, found at Thebes, with a shepherdess carrying a child on her back and holding a basket of fruit (Schlunk, 1939, no. 108), and a silver plate from the tombs of Ballana and Qustul (dated by coins from 364–640). Two pyxides with Christian subjects (Grado, Italy, Cathedral Treasury) have been assigned to the 5th century, but it is more likely that they are of the 6th century and were made in Ravenna. It is generally agreed that some part of the silver, of inferior quality, found at Mildenhall, Traprain Law, and other sites in northern Europe was made in Gaul; examples include a fragment of a vase with bacchanalian scenes and a Hercules dish, both from Traprain Law; the Risley Lanx and four bowls, with mythological heads on the base and hunting scenes on the rim, from the Mildenhall Treasure. Some of the less accomplished pieces found at Mildenhall may have been made in Britain.

Ivories. By a curious chance, one of the earliest Western carvings in ivory of the late-antique period is Christian. Most scholars agree that the date of the Brescia Casket (VIII, PL. 240) lies within the third quarter of the 4th century, although an attempt has been made to place it as early as the second quarter. Scenes from the Old and New Testaments are carved in a cold replica of many 4th-century sarcophagus reliefs, but the precise statement of form and the use of space suggest that the patron or artist was thinking in terms of past esthetic standards. There seems to be no doubt that toward the end of the 4th century there was in Rome an atmosphere of classic revival, partly as a result of patrician patronage. One of the most beautiful of all late-antique carvings in ivory, the Nicomachi-Symmachi diptych (I, PL. 301), was produced probably to celebrate the profession of a priestess — the two families, closely related, represented the hard core of paganism in Rome — but a marriage between the two houses, in 401, has also been suggested. This diptych and that (in Berlin) of Probianus, Vicar of Rome about 400, serve as the prime examples around which a number of distinguished carvings in ivory may be assembled: the Asklepios and Hygieia diptych (VIII, PL. 240); a small casket in Paris (Bib. de l'Arsenal); the Trivulzio relief with the Marys at the Sepulcher (VIII, PL. 240); the Ascension relief (Munich, Bayerisches Nationalmus.); and, somewhere within this ambiance, the Adam in Paradise and St. Paul diptych (Florence, Mus. Naz.), and the Querini diptych (Brescia, Mus. Cristiano), with representations of Hippolytus and Phaedra and, possibly, of Artemis and Endymion. It can be seen that, in spite of tenacious paganism in certain Roman circles, the workshops served both the old and the new religions. Slightly below the quality of the above-mentioned reliefs, the so-called diptych of "Stilicho and Serena" (PL. 84), may conceivably have been carved in Milan; and it is possible that the diptych of Probus (Aosta, Cathedral), with a representation of the emperor Honorius is also Milanese — though, stylistically, a Roman origin seems more likely.

Probably of slightly later date, but closely allied to the Probianus diptych, are the panels in the British Museum with scenes of the Passion and Resurrection of Christ. They may not be far removed in time from the diptych of the Lampadii (Brescia, Mus. Cristiano), probably from about 410. The diptych of Constantius III (Halberstadt, Cathedral Treasury), may perhaps be dated to 417, the diptych, so-called of "Patricius" (Novara, Bib. Capitolare) to 422, and that of Felix (Paris, Cab. Méd.) to 428. Assigned to the decade between 430 and 440 are the Berlin (Staat. Mus.), Paris (Louvre), and Nevers (Mus. Municipal) panels with scenes from the life of Christ; the Moses, St. Peter, and St. Thecla panels (Br. Mus.); and the Pola Casket (Pulj, Yugoslavia, Archaeol. Mus.), also with Christian subjects. This group should be compared stylistically with the wooden doors of S. Sabina (PL. 83) in

Rome, carved about 430. In the third quarter of the 5th century appear two superb panels with circus combats: the *venatio* panels in Liverpool and in Leningrad. Of approximately the same date are a Bellerophon panel (PL. 85), and another bearing an apotheosis, possibly commemorating the tercentenary (463) of the *consecratio* of Antoninus Pius (Br. Mus.); the Dionysus-Selene diptych (Sens, Cathedral Treasury); and the "Andrews Diptych" (PL. 85), with scenes depicting the Miracles of Christ. After the capitulation of the young emperor Romulus Augustulus to Odoacer, four authentic consular diptychs are known: that of Basilius (480), divided between Florence (Mus. Naz.) and Milan (Cathedral Treasury); that of Boethius (487), in Brescia; that of Sividius (488), in the Cabinet des Médailles, Paris — all showing a marked decline in quality; and lastly, that of Rufus Gennadius Probus Orestes (530), in London (Vict. and Alb. Mus.), which is a coarse copy of the Constantinopolitan diptych of Clementinus (513).

The ivory diptychs issued by consuls holding office in Constantinople as a rule reveal the consul as presiding over the games. They include those of Areobindus (506), who was responsible for the several versions in Zürich (Landesmus.), Besançon (Mus. B. A.), Paris (Mus. de Cluny, Louvre, and a private coll.), Leningrad (The Hermitage), and Lucca (Bib. Capitolare) and also that of Justinus (540) in Berlin (Staat. Mus.). The diptych of Clementinus (513) is in Liverpool (Public Mus.); that of Anthemius (515), which was in Limoges, is lost; some of those of Anastasius (517) are divided between Berlin (Staat. Mus.) and London (Vict. and Alb. Mus.), and some are in Leningrad (The Hermitage), in Verona (Bib. Capitolare), in Paris (Cab. Méd.), and in Rome (Mus. Vat.); the supposed diptych of Magnus, dated 518 (PL. 84), is divided between the Castello Sforzesco, Milan, and the Cabinet des Médailles, Paris. Diptychs issued by Justinian (521) are in the last two collections, and a third is in the Metropolitan Museum, New York; those issued by Philoxenus (525) are in the Cabinet des Médailles, Paris, and in the Dumbarton Oaks Collection, Washington, D.C.; that of Apion (539) is in the Cámara Santa of the Cathedral in Oviedo. In addition, a number of imperial diptychs appear to have been issued at Constantinople: the panels depicting an empress, probably Ariadne (d. 515), in the Museo Nazionale in Florence, and in the Kunsthistorisches Museum, Vienna; sections of a diptych, according to one scholar datable only to the years of the reign of Anastasius (491–518), in the Castello Sforzesco, Milan; and the much debated "Barberini Diptych" (PL. 85), variously assigned to Zeno (474–491), Anastasius, and Justinian (527–565).

Closely related to these ivory reliefs carved for officials in Constantinople in the first half of the 6th century, but strictly speaking outside the late-antique period, is the superb leaf of a diptych with a Greek inscription and a representation of the Archangel Michael (Br. Mus.); this has been tentatively identified as a commemoration of the reunion of Rome and Constantinople in the presence of the papal delegates in 519. The serene diptych with representations of Christ enthroned between SS. Peter and Paul and of the Virgin and Child between two angels, now in Berlin (Staat. Mus.), and the so-called "throne of Maximian" (V, PLS. 340, 432), dating probably from the middle of the 6th century and variously assigned to Constantinople, Alexandria, and Ravenna, seem to represent aspects of the Justinianic "renovatio," which should be seen as the first phase of Byzantine art. To this phase, also, should be assigned the Poet and the Muse diptych (Monza, Italy, Cathedral Treasury), dated in the past to the 4th, 5th, and 6th centuries, which, because of its similarity to Justinianic silver, should be assigned to Constantinople. The diptych now serving as a book cover in the Treasury of the Cathedral in Milan, with Christian scenes and embellished with enamels, is Italian work dating from the middle of the 6th century.

In addition to these reasonably datable carvings in ivory, there is a large group of reliefs and pyxides which has been ascribed to first one part of the Mediterranean world and then another, and which has been shifted from date to date. It is probable that most of the debatable pieces fall outside the late-antique period and must be looked upon as provincial artifacts. But there is a sequence of rather coarse, largely pagan carvings in bone and ivory, found on the outskirts of Alexandria and in Egyptian rubbish heaps, which would seem to be Egyptian work dating from the late 3d century to the 6th century. In quality some of the finest are a small ivory fragment of a Bacchic procession, found at Oxyrhynchus (Bahnasa), now in the Victoria and Albert Museum, London (Longhurst, *Catalogue*, I, p. 21, fig. 1); a statuette of Mars (?) and an ivory box with a representation of Dionysus with a maenad, a satyr, a Tyche, and an Eros — both in the Dumbarton Oaks Collection, Washington, D.C. (*Handbook*, nos. 223, 224); and, by analogy, some boxes with representations of Asklepios and Hygieia. A relief representing Apollo and Daphne (Ravenna, Mus. Naz.) and the figure of a naked girl (Baltimore, Walters Art Gall.; *op. cit.*, no. 177) suggest by comparison with Coptic sculpture in Herakleopolis Magna (Ahnas) an Egyptian provenance dating from the late 5th century. It may be that a carved ivory panel with the figure of a bearded saint in the Monastery of Kikko, Cyprus, is also Egyptian, but of the 6th century.

The assigning of groups of ivory carvings with certainty to other centers is difficult, but there seems no reason to doubt that carvings in ivory were made in various parts of the Empire. The cautious student will prefer, however, concrete evidence in the form of inscriptions or other unassailable archaeological detail to personal theories about Antiochian, Alexandrian, north Italian, and Gaulish styles or groups based on tendentious iconographical speculation.

Textiles. The problems set by late-antique textiles are in some respects less complex and in others more so. The majority of the textiles — they number many thousands — of this period have been found in Egyptian burial grounds; and although finds at Dura-Europos, which were produced presumably before 256, and at Palmyra, before 273, led to speculation on technical grounds that sequences of fragments found in Egypt were imported from elsewhere, the general conclusion, on both stylistic and technical evidence, must be that textiles found in Egypt were, on the whole, made in Egypt. As a result of prolonged Greek and Roman occupation, however, the patterns reflect Hellenistic and Roman influences, and may with reason be regarded as echoing Western fashion. Problems of workshop differentiation in Egypt, on the other hand, and problems of dating both stylistic and technical innovations are more difficult to resolve. The greater part of the textiles found in Egypt were almost certainly woven not in factories but in the home; and production of this sort is apt to resist any rigid attempt at classification. The main sequences have always been assumed to have begun in the second half of the 3d century, when mummification ceased to be a general practice, but there are few textiles which may be assigned with confidence to this early date. A roundel tapestry woven in purple wool and undyed linen thread, found at Hawara, is dated by coins to about A.D. 340, and this type of ornament is paralleled by the textile patterns of costumes depicted in the mosaic floors of the Tetrarchic villa in Piazza Armerina (X, PL. 178), believed to date from the early 4th century. But it is equally clear that such patterns continued to be used over a considerable period of time: they are reflected in the Missorium of Theodosius I and in 6th-century mosaics at Ravenna (II, PLS. 440, 446; IV, PL. 18). In general, when reviewing Egyptian textiles, the student must rely on broad principles of stylistic development, the application of which is apt to be subjective. From the technical point of view, one of the major developments of the craft was the invention of the drawloom, but the date and place of this discovery are still shrouded in mystery. Patterns on the chlamys worn by "Stilicho," represented on the ivory diptych in the Cathedral Treasury in Monza, suggest that this is a drawloom-woven fabric; thus it is probable that the invention had been made before the end of the 4th century. In the late-antique period the majority of textiles found in Egypt were made on a simple tapestry loom. The materials used were, for the most part, linen and wool. Gold thread was probably much more extensively used, both in tapestries and embroideries, than the surviving examples suggest. Although Chinese silks were found

at Palmyra and cotton has been found in Syria and Nubia, examples of silk and cotton from the 4th and 5th centuries are extremely rare.

It is reasonable to assume that large-scale historiated hangings existed from early times, but few have survived. The fragment of a large woolen tapestry with a mask and a duck set in a network of jeweled bands, in the Dumbarton Oaks Collection (*Handbook*, no. 297), has been assigned to the 4th or 5th century, and there is a similar tapestry in the Textile Museum, Washington, D.C. The superb woolen tapestry woven with Nereids riding on sea monsters, also at Dumbarton Oaks (*Handbook*, no. 298; Peirce and Tyler 1932–34, I, pl. 141), has been assigned to the same period, but a late date is not unlikely. A fragment of a weft-loop woolen rug with geometrical ornament (Met. Mus.) may date from the 4th or 5th century. There seems no reason to doubt that a sizable weft-loop woolen panel with Erotes fishing from a boat (Br. Mus.) dates from the 4th century. But, generally speaking, curtains and other household fabrics have grounds of undyed linen decorated with occasional scattered ornament — roundels, squares containing mythological subjects, flowers, birds, rabbits, and other animals — woven at random intervals. The decoration of tunics at this time consists of shoulder bands that continued from shoulder to hem or end in a pendant ornament halfway down; roundels or squares at about knee level and on the shoulders; cuff bands, and sometimes neck and hem borders. Within these bands, roundels, squares, and borders may be depicted pastoral scenes, such as the elegant late-4th-century fragment (London, Vict. and Alb. Mus., no. 1028–1901); hunting scenes, warriors, heads of gods and allegorical figures, such as the beautiful Dionysiac head (Washington, D.C., Textile Mus. no. 71.106), or the Nile and the Earth (Leningrad, The Hermitage; Moscow, Mus. of Fine Arts); and Nereids, Tritons, and Erotes, as in the silk, gold, and wool tapestry (Boston, Mus. of Fine Arts, no. 46. 401), dating probably from the middle of the 5th century. The fashion for historiated scenes on clothing seems to have developed during the second half of the 4th century. Asterius, Bishop of Amasia in Pontus (d. 410), in a homily described with some indignation people wearing pictured garments and looking like painted walls; some even wore sacred scenes, such as Christ with the apostles or the Miracles of Christ. Surviving textiles decorated with Christian scenes attributable to the late-antique period are rare, and it is possible that they did not become common until the 6th century. A well-known tapestry fragment in linen and wool with the figure of a Victory holding a garlanded Cross (Vict. and Alb., no. 349–1887) has been assigned in the past to the 5th century, but on stylistic grounds a later date seems preferable. There can be no doubt that sequences of debased late-antique patterns continued into the early Islamic period.

Groups of drawloom-woven fabrics in wool, found in Egypt, have been assigned to the 3d century — for example, a fragment of compound tabby (Philadelphia, Mus. of Art), decorated with a hunting scene (Weibel, 1952, no. 37) — but it is unlikely that any group in this debased style existed before the 6th century. Drawloom-woven silks, either compound tabby or compound twill, assignable with any certainty to the 5th century are exceedingly rare. It is probable that the majority of those given in the past to the 5th century should be dated later. Likely candidates for the earliest "Western" silks are a compound tabby and a compound twill woven with a scenes from the life of Joseph, a maenad hunting twill and a goatherd twill, a series of twills with birds framed by acanthus leaves, and a series of allover lozenge patterns containing palmettes and small leafy sprays (all, Sens, Cathedral Treasury), a pastoral scene (Boston, Mus. of Fine Arts, no. 11.90); a Nereid silk divided between the Cathedral Treasury of Sion (Sitten), Berlin (Staat. Mus.), and Zürich; a pastoral scene with horses drinking from a trough and men plucking fruit (?) from a tree, in the Treasury of the Abbey of St-Maurice d'Agaune; an early twill-damask with a hunting scene, in the Basilica of S. Ambrogio, Milan; and a fragmentary silk twill with a representation of Daniel in the lions' den (Vict. and Alb. no. T.93-1937). The provenance of all these is uncertain, but Constantinople, Antioch, and Alexandria have all been suggested, and it is known that there was a factory at Carthage. A twill fragment decorated with parrots (Vict. and Alb., no. T.104-1949), a silk with peacocks, ducks, and parrots (New York, Cooper Union Mus., no. 1902-1-210), and a silk with griffins, ducks, and leafy sprays (Sens, Cathedral Treasury) approach the court dresses represented in the imperial mosaics in S. Vitale in Ravenna and thus may be of 6th-century date; but, if this is so, some of the silks previously mentioned should be dated about the same time.

Glassware. Glassware has survived in considerable quantities from various parts of the Empire, and it is probable that almost all the big cities of the ancient world had factories. Glass was made in Syria and North Africa; it is probable that there were factories in the Danube basin, in Greece and the Balkans, and in Asia Minor. Fine examples of glass were produced in Italy and in the Rhine-Moselle area, where Cologne was an important center.

Glass from Syria, ranging in date from the 3d to the 6th century, tends to be unfigured and is characterized by simple shapes decorated with fantastic whorls and spirals of drawn solid threads. Time and oxidization have formed a patina to which only the most rigid purist would object, and the colors range from murky white to iridescent greens and bronzed blues. Similar glass was made in the Rhineland. Flasks in the shape of human heads were made both in Syria and in the West. A fragment of enameled glass dating from the 3d century was found at Dura-Europos, and a group of painted glasses, typified by the Daphne Vase (found in the Crimea) and the Judgment of Paris dish (found near Damascus), both now in the Ray Winfield Smith Collection (Corning Glass Center, *Glass from the Ancient World*, 1957, nos. 341, 342), has been assigned to Antioch. Although a considerable amount of glass has been excavated at Karanis, and other finds have passed through the hands of dealers in Cairo, the general standard of production suggests that the importance of Alexandria as a glass-producing center had diminished before the late-antique period.

From an esthetic point of view, a series of cut and engraved glasses from a variety of finds are the most distinguished of the period. The series may be divided into various categories, and it is clear that the varied groups were made in factories in different parts of the Empire. The group known as *diatreta*, or "cage-cups," is of superb quality. The cage-cup was made by cutting and grinding openwork decoration out of a thick blank of cast or blown glass, the decoration being attached to the wall of the inner portion by small shanks or bridges left for this purpose by the glass cutter. Perhaps the finest example is the cup with a representation of Lycurgus (PL. 88), probably Roman work of the second half of the 4th century. It has been related to the Cagnola cup (Varese, Mus. Civ.); to a situla with a hunting scene (VI, PL. 221); to a fragmentary cup decorated with the Pharos of Alexandria, found in Begram in Afghanistan (Kabul Mus.), for which external evidence may demand a closing date in the middle of the 3d century; and to a cup with fish and snails, found in Szekszárd, in the Budapest Historical Museum. The presence of the Pharos of Alexandria suggests that Alexandria may also have been a center for this type of work, but it seems reasonable to suppose that many of the finds in the West are Roman. A Roman workshop has also been claimed for a fine, deeply engraved situla with Dionysiac scenes (PL. 88).

On the other hand, a group of glasses engraved with a type of hard-stone point (it is not known whether a diamond point was available at this period) would seem to have been made in Cologne in the 4th and 5th centuries. This sequence includes the Wint Hill hunting bowl (Oxford, Ashmolean Mus.); a bowl, found at Homblières (Aisne) and now in the Louvre, dating from about 400 and decorated with the sacred monogram and Biblical scenes; a cup engraved with the Raising of Lazarus (New York, Mrs. W. H. Moore Coll.), dating from the 4th century (Baltimore, Walters Art Gall., *op. cit.*, no. 625); and a goblet, found in Cologne, engraved with Adam and Eve, Moses Striking the Rock, and the Raising of Lazarus (Br. Mus. *Guide to Early Christian and Byzantine Antiquities*, 1921, p. 172). The list may be extended by a number of pieces found in or

near Cologne, with representations of Susanna and the Elders, Poseidon, and scenes from the Old and New Testaments, all in Berlin (Staat. Mus.; cf. Schlunk, 1939, nos. 193–98).

Some glasses, dating apparently from the 3d to the 5th century, have rather rough designs executed with a wheel tracing lightly over the surface. There may have been both Eastern and Western schools producing this type of glass. The Highdown Hill (Worthing Mus.) goblet has been assigned to an Egyptian workshop, and a considerable number have been found in Egypt at Hawara, Karanis, and Oxyrhynchus. It is possible to argue that the examples found in the West are all imports, but it would be rash to be dogmatic. Painted glasses, found mainly in Scandinavia and Britain and dating from the 3d to the 4th century, are decorated with various kinds of animals and birds; these are believed to have been made in Cologne and other factories in the Rhine-Moselle area.

Rome would seem to have been the chief source of an extensive sequence of gilded glass. Large quantities, ranging in date from the 3d to the 5th century, have been found in Roman catacombs, with many examples bearing Christian subjects. Sometimes glass medallions, such as portrait miniatures, were made for their own sake; but as a rule they formed the bottoms of cups or plates or were fused into the sides of glass vessels. The majority were made for domestic use and, as the inscriptions show, were given as gifts on the occasion of weddings, birthdays, and various anniversaries. They were often used, too, as a seal in the mortar that closed a tomb. It has been suggested that, since the labels on the earliest of these glasses — for example, the family portrait in the Museo Cristiano, Brescia (VI, PL. 226) — show Egyptian and Greek peculiarities, and since there are iconographical similarities to the Fayum mummy portraits, a case can be made for Alexandrian influence and craftsmen at work in Italy. The Ficoroni medallion (Met. Mus.), bearing a portrait of a lady and her son, has been assigned to Alexandria in the second half of the 3d or the early 4th century. But family portraits in diverse media are common enough in Rome; and, since there is no doubt that Greek was written in the metropolis, the main sequences suggest indigenous patronage and workmanship. At the same time, there is every reason to believe that this type of work was produced in other centers, notably Cologne. It is probable that a dish with portraits of the sons of Constantine I, found in Cologne (Delbrück, 1933, pl. 45), and a gilded glass dish with scenes from the Old and New Testaments, also found in Cologne (Br. Mus., *Guide to the Early Christian and Byzantine Antiquities*, 1921, p. 141, fig. 91), among a number of examples found in northern France and the Rhineland, were made locally. Although undoubtedly the most beautiful are the stern, melancholy portraits of individuals or family groups (PL. 80), the later sequences with their mixtures of pagan, Jewish, and Christian symbolism reflect the popular taste of cosmopolitan but declining Rome. The mythological scenes, as on the contorniates, are coarse and stereotyped; the Jewish emblems are presented with considerable broadness of effect; and the Christan examples, although iconographically interesting, make it plain that the art of the common body of the faithful was seldom governed by high esthetic standards.

A study of other sequences of ceramics, terra cottas, and urns, and of household artifacts such as bronze lamps, candlesticks, and other furniture suggests that outside the court or the patronage of the great patricians, standards were low. Bronze counterpoise weights were still fashioned in the likeness of imperial busts, but they bear no comparison to the Missorium of Theodosius I or the ivory diptych of Probianus.

LA TOUR, GEORGES DE. French painter (b. Vic, 1593; d. Lunéville, 1652). Sometime after his marriage in 1617, La Tour moved from Vic, the small capital of the bishopric of Metz in the duchy of Lorraine, to Lunéville, where by 1620 he appears to have had an active studio. Lunéville was the summer residence of the Duke of Lorraine, who commissioned from the artist a painting of St. Peter. In 1633 the duchy was occupied by the French. In that same year La Tour offered a painting of St. Sebastian to Louis XIII. In 1638 Lunéville was burned and sacked as it changed hands between the French and local partisans; during this period La Tour went to Nancy and perhaps to Vic and to Paris. He reappeared in Lunéville in 1641 as a rich court painter, detested by the people but protected by the royal governor of Nancy, who had Lunéville present him with some of La Tour's paintings, paid for by taxes.

The complexity of the artistic influences upon La Tour seems in part to explain the enigma of his genius. Although somewhat behind the times, the visual arts of Lorraine nevertheless influenced his style to some extent, for his religious night scenes follow an old Lorrainese tradition. The chiaroscuro paintings — of beggars with elongated faces and tapering fingers — by the mannerist Jacques Bellange, who dominated the court of Nancy from 1600 to 1617, also left their mark on La Tour.

From 1614 to 1616 La Tour was probably in Italy. His work, like that of Jean Jacques Tournier and Jean Tassel, is generally considered to be Caravaggesque, but the most obvious points of similarity between his style and the art of Caravaggio — interest in chiaroscuro and the popular pseudorealism of his religious scenes, secularized in order to make the holy figures more accessible to the faithful — are only superficial; La Tour's forms and colors are used for other ends (A. Malraux, 1953). Decidedly different from the *tenebrosi* — the somber painters — La Tour comes closer to the artists who blended some elements from the art of Caravaggio with others from that of Jacopo Bassano and of such painters of the school of Brescia as Carlo Saraceni and Paolo Piazza. The presumed influence of Luca Cambiaso — the mannerist who antedated Caravaggio — on La Tour during his supposed visit to Genoa is not substantiated by the few analogies to that artist's work found in La Tour's paintings; likewise, the nocturnal *Nativity* of J. Sánchez Cotán was an antecedent of, but not a source for, La Tour. The phrase "La Tour lorrain, élève de Guide," which appears in the chronicle of the monastery of Saint-Antoine-en-Viennois, is a more important clue, inasmuch as the monastery possessed original paintings by La Tour (e.g., *St. Jerome*; Grenoble, Mus. de Peinture et Sculpture); Guido Reni's influence on La Tour seems to have encompassed flawless technique, precise drawing, nobility and sweetness of expression, and balance in design.

The types of faces and figures, the lighting effects, and the subject matter in La Tour's paintings all reveal the influence of Dutch Caravaggesque painters, whose works La Tour may have known and with whom he might even have had direct contact. According to Blunt (1954), two trips made by La Tour determined the evolution of his art. The first (1620–30) exposed him to the school of Utrecht, which inspired him to paint realistic daylight scenes that reflect the influence of Terbrugghen's *The Four Evangelists* (1621; Deventer, Stadhuis) or even later works by the Dutch master. Blunt believes that La Tour subsequently painted nocturnes in which the source of light remained concealed, and that only after a second trip, in about 1640, did he begin to expose the source of light, in the manner of Gerrit van Honthorst (q.v.). It is also possible that La Tour painted both day and night scenes all along.

There was a marked Italian current in Lorraine. La Tour met both Jacques Callot (q.v.), who had formerly worked at the Medici court in Florence, and the disciple of Saraceni, Jean Le Clerc, who was no genius but had an inquiring mind and may have impelled Callot and La Tour to paint night scenes. Shortly before his death in 1632, Le Clerc engraved four night scenes, one of his own invention and three after works of La Tour, which helped to make La Tour's work known. Between 1631 and 1640 La Tour may have gone to Paris. In any case, he was aware of several of the currents in Parisian art, perhaps only because of his acquaintance with Callot, Israël Henriet, and the French artists active in Lorraine; he knew the work of the popular realists and of the Italianate religious painters, and he was responsive to the movement toward a classical style.

These Dutch, Italian, and French elements appear in each of La Tour's paintings in different combinations, which explains the tenuous classifications and contradictory interpretations characteristic of studies up to the present time. There are only two dated works by La Tour. Many are signed, but some of the signatures seem questionable. Frequent recurrence of themes and motifs and the problem of separating originals from studio replicas add to the confusion. The only connecting links are his technique, the manner in which he rendered forms colored by light, and the engravings that were made after his works.

Much uncertainty remains as to La Tour's earliest work; *The Peasant Family* (San Francisco, M. H. de Young Memorial Mus.) must be excluded, as well as the *Pièta* (Chancelade, Dordogne, parish church; copy in Amsterdam, Rijksmus.) and such other works as *The Young Girl with a Lamp* (San Francisco, Calif. Palace of the Legion of Honor).

The Cheat (or *The Sharper*) can be firmly dated about 1625 (Paris, Coll. Landry; copy in Geneva, Coll. Marie Pictet). It is a daylight scene, evidently influenced by Terbrugghen, but with a certain harshness; the palette is clear and varied, and the composition has been executed with patient precision. The scene is apparently an innocent one, but with latent drama. *The Fortune Teller* (New York, Met. Mus.) is of slightly earlier date, according to Sterling; this painting is signed, and Lunéville is mentioned in the inscription. It too is a daylight scene, related to *The Cheat* and to the paintings of Terbrugghen. In the development of La Tour's style, *The Fortune Teller* leads to his *Servant with the Flea* (PL. 95), discovered in 1954, which is similar in certain details but shows the attempt to build up masses in a haze of nocturnal light. The servant girl is shown crushing the flea with such concentration that the Honthorstian theme is completely transformed.

The Newborn or *The Nativity* (PL. 93) — painted no later than about 1630 — is a family scene but at the same time a devout work, enchanting in its melancholy tenderness and its luminous effects of blended reds and mauves. It approaches his composition *The Old Women*, which was engraved by Le Clerc before 1632 and to which a *St. Anne* (U.S.A., private coll.) may also be related. To a second engraving by Le Clerc, *St. Francis in Ecstasy* — a night scene, with striking contrasts in lighting, showing the saint with another monk in a cell — may be connected a fragment of a similar composition (Hartford, Conn., Wadsworth Atheneum) attributed to La Tour,

as well as his *Two Monks* (Le Mans, Mus. B. A.), depicting a saint in ecstasy; the latter, having been repainted in part, is an uneven painting that has been much discussed and is later in date than the engraving. A third engraving by Le Clerc is of another candlelit scene with a half-length figure of Mary Magdalene; on a table a skull seen against the light is reflected in a mirror. Two copies of this work are known (Besançon, Mus. B. A.; private coll.), and there are subsequent interpretations by La Tour of the same theme.

His *Adoration of the Shepherds* (Paris, Louvre; copy in Albi) is a nocturne with as vibrant an atmosphere as that of *The Nativity*, but some of its characteristics — fuller composition, less emphasis on realistic detail, more concise yet lighter and freer execution — place it between 1630 and 1635. The painting of St. Sebastian which La Tour presented to Louis XIII in 1633 (preserved only in eight replicas, among them those located in: Orléans, Mus. B. A.; Rouen, Mus. B. A.; Detroit, Inst. of Arts) is an authoritative composition, organized in planes that are emphasized more than in earlier works, its realism underlined by the lantern and by the figure of St. Irene in contemporary middle-class dress.

After 1633 La Tour became more of a realist. For a lay clientele, which was in part French, he painted the *Souffleurs*: a young girl at the brazier — mysterious, tinted red by the light (three versions of this composition are known; signed one in Paris, Coll. Neger) — and a smoker with firebrand (also in several versions). Also in this category are some compositions known only through replicas or copies: *The Boy with the Cap*, *The Lute Player*, and *The Drinker*. Among his religious paintings are some strongly realistic daylight scenes: half-length representations of apostles dressed as peasants or as militiamen; one of these, a signed painting (private coll.), is a bold work with silver, green, and brown tonalities. To these works should be added a series of paintings of Christ and the apostles (Albi, Mus.; originally painted for the Capuchins), two of which are quite beautiful and may be originals, the others being surely replicas or copies. There are also a *St. Andrew* (Paris, private coll.) that appears to be an original and a replica of *The Brawl between Beggars and Strolling Musicians* (Chambéry, Mus. d'H. et d'Archéol.), which exaggerates the style of this period, confirming analogies with the French realists and the continuing influence of Dutch art, and revealing La Tour's austere irony.

These paintings prefigure La Tour's masterly daylight scenes with full-length figures of the period 1635–40. *The Hurdy-gurdy Player* (PL. 94) was at one time attributed to the Spanish school, but it is typically French in its realism, which is reminiscent of Callot, a realism that is sometimes extreme but not homogeneously applied. There are inert areas in the painting, as well as scumbling, occasional calligraphic drawing, and vivid colors. Connected with it are replicas of other compositions of the same subject (Bergues, Mus. Municipal; Nancy, Mus. Historique Lorrain; signed fragment of a painting of two or three figures, Brussels, Mus. Royaux d'Art et d'H.). Also in the same style and dating from the same period are two versions of *St. Jerome*, one in Stockholm (PL. 94), the other in Grenoble. In a third rendering (Paris, Louvre), the theme of St. Jerome becomes a pretext — as in the painting of the apostles — for a realistic representation, here showing a notary at his work table; there are also two additional versions of this theme, probably both replicas (London, Royal Colls.; U.S.A., private coll.).

La Tour's mystical night scenes dating from about 1640 are of monumental grandeur, often suggesting silent dialogues between two beings, an active figure dominating an apparently more passive one, or they may depict dreamy or bemused children in profile. In these, the palette becomes more severe, tending toward browns and violets, and great changes appear in the rendering of forms and in technique. His *St. Joseph the Carpenter* (II, PL. 185; copy in Besançon, Mus. B. A.) is an amplification, in a solemn tone, of a theme by Honthorst. The full-length *Magdalen with the Night Light* (PL. 91), a signed painting, is also broad in execution, but is rendered in a more flowing manner, with exacting detail and without geometric exaggeration. The subject is shown as a fervent penitent; but the type is the same as that used by La Tour throughout his life, at times realistically and at times ideally represented, to suggest wordly or heavenly themes. *The Magdalen with a Mirror* (Paris, Coll. Fabius), later in date, with chiaroscuro accents that produce an almost monochrome effect, again takes up, in part, motifs from the engraving, but the saint is a full-length figure and the fluid composition approaches that of the *Repentant St. Peter*, signed and dated 1645 (Cleveland, Mus. of Art), a painting of an almost too unrestrained virtuosity in its transparent effects and pathos.

Children recalling the *Souffleurs* or the Jesus in *St. Joseph the Carpenter* appear in some of his religious works, such as *The Angel Appearing to St. Joseph Asleep* (Nantes, Mus. B. A.), *The Education of the Virgin* (copies in Dijon, Mus. B. A.; New York, Frick Coll.), and *The Discovery of the Body of St. Alexis*, a painting noted in 1647 (PL. 95; also Belgium, private coll.).

Other night scenes indicate a growing tendency to lay bare the essential structure of the compositions. *St. Sebastian Mourned by St. Irene* (PL. 92; copy in Bois-Anzeray) — "a static tragedy," according to P. Fierens — is derived from Caravaggio's *Deposition* (Rome, Mus. Vat.) and seems to go back to the style of Reni and perhaps is even a repetition of the same subject, but La Tour paints in a more polished manner and is concerned with the illumination of every facet of spatial dimension in a colored atmosphere. This geometric stylization is exaggerated in *The Mocking of Job* (Épinal, Mus. Départemental des Vosges), and in *The Denial of St. Peter* (PL. 93) — a signed work dated 1651, commissioned in 1650.

La Tour's collaboration with his son may explain certain dissonances apparent in his later works. In his final years he occasionally reused former compositions or borrowed from foreign artists. For example, he drew upon an engraving after a work of Seghers of about 1630; although he was isolated in Lorraine from progressive art currents, La Tour still knew how to refine the animated and more vulgar Flemish subjects of that artist with delicacy, serenity, and dramatic tension, adopting his angular forms but rendering them in a rarified and coloristic atmosphere.

The works of La Tour are infused with an intelligent order, an essential calm, and a sobriety of purpose that link him to a French tradition of "classical" harmony and of the "integrity" of art. He had little interest in problems of composition and little desire to formulate new ideas, which resulted in a certain inflexibility, in a limited repertoire of subjects, in the frequent repetition of forms, but his technique was constantly shifting — cursive or painstaking, impetuous or relaxed, and finally cool and cautious. He delighted in color-light effects that recall medieval theories, and he progressed slowly toward abstraction; he rendered objects with a muted but luminous palette (centered about reddish tones) and used reflections and nuances of light to model volumes in a vibrant aura of color. These light effects are worked out with scientific precision but have little correspondence to actual reality; they suggest simultaneously reality and mystical abstraction. La Tour's is an unrealistic art that continually makes use of fragments of reality, combining and even distorting them, in order to express ideas and feelings.

The work of La Tour reveals little empathy with the world but rather a familiarity with the supernatural. There is a motionlessness that seems infinite. The silence, purity, sweetness, meditation, ecstasy, suffering, self-denial, penitence, and resignation that prevail in his paintings and, in the background, themes of the Crucifixion and of redemption, relate La Tour to certain religious orders, in particular the Capuchin monks, who were both his friends and clients. His art was wholly impregnated by Franciscan spiritualism, which, along with the religious humanism of the Jesuits and the strict codes of the Jansenists and Calvinists, contributed to shaping the French spirit of the 17th century.

La Tour has been cited by Michel de Marolles (*Livre des peintres et graveurs*, Paris, 1677) as among those artists honored by Lorraine, but he was soon forgotten in spite of continued admiration for some of his works. Thanks to the studies of some modern scholars — Voss (1914–15), Weisbach (1932), Sterling (1935), Isarlo (1941), Jamot (1948), and Bloch (1950),

among others — La Tour has emerged with his proper stature, as one of the greatest of the 17th-century French artists.

Illustrations: PLS. 91–95.

LATOUR, MAURICE QUENTIN DE. Pastel painter of the French school (b. Saint-Quentin, Sept. 5, 1704; d. Feb. 17, 1788). Little is known of Latour's early career. He went to Paris in 1723 and introduced himself to the engraver Nicolas Henri Tardieu, who placed him with Jean Jacques Spoede and Claude Dupouch, both members of the Académie de St-Luc. According to early sources, Latour was in London from 1724 until 1727, and upon his return to Paris first posed as an Englishman to draw attention to himself and his work. In 1737 he was accepted as a candidate for membership in the Académie Royale, but he did not become a full member until 1746, when he submitted a pastel portrait of Jean Restout. Within the Académie he attained only the rank of *conseiller*. He exhibited portraits in pastel regularly at the Salons from 1737 until 1773; his best work appeared between 1740 and 1760. Among Latour's sitters were members of the royal family, the nobility, and leading intellectuals of the period such as D'Alembert, Voltaire, and Rousseau.

Toward the end of his career, in 1778–79, he founded a free drawing school in his native city of Saint-Quentin. He established prizes for students at the Académie Royale in Paris and, in 1783, a scientific prize for the Académie des Sciences, Arts, et Belles-Lettres in Amiens. Interested in literature, politics, and science, he enjoyed a reputation as a witty, intelligent conversationalist. In 1784, however, he began to show symptoms of insanity and retired to Saint-Quentin, where he was welcomed as a benefactor by the townspeople. The following year he was legally declared not responsible for his actions. Although the works left by the artist at the time of his death were to have been sold to benefit his favorite charities, many of them remain in the Musée Lécuyer in Saint-Quentin.

Latour's *œuvre* consists entirely of portraits in pastel, a medium that enjoyed a great vogue in 18th-century France, where it was popularized in 1719–20 by the visit to Paris of Rosalba Carriera, a noted Venetian pastelist. From the beginning Latour's portraits were much admired by the Salon critics; they overshadow those of contemporaries such as J.-B. Perroneau who worked in the same medium. Latour's manipulation of the crayons, it was felt, conveyed not only an astonishingly frank, animated likeness of his sitters but also a genuine insight into their personalities. These effects were achieved, despite the apparent spontaneity of his technique in this difficult medium, by repeated changes and corrections. Among Latour's most ambitious compositions are *Mme de Pompadour* (ca. 1755) and *Philibert Orry* (1745), both in the Louvre. Also of interest are his self-portraits, one of unknown date (Louvre) and another of 1751 (V, PL. 411), and his preparatory sketches, such as that of *Mlle Fel* (1757; Saint-Quentin, Mus. Lécuyer).

John W. MCCOUBREY

LATROBE, BENJAMIN. Architect (b. Fulneck, near Leeds 1764; d. New Orleans, 1820). The remarkable record of Latrobe as an architect in America was very likely not anticipated by his English friends and contemporaries, for he left England in the fall of 1795, dejected and bankrupt, having lost his wife in childbirth and having failed in private architectural practice. Latrobe's Moravian parents provided him with an excellent classical education, which he completed in Germany. Upon returning to London, he tried various jobs and eventually worked for three years in the office of the successful architect Samuel Pepys Cockerell.

Upon his arrival in America, Latrobe's talents were quickly recognized, and he was commissioned to build the penitentiary in Richmond, a number of private houses, and the Bank of Pennsylvania in Philadelphia (1798–1800). The last was doubtless the most handsome public building in the country at the time; its Ionic order and proportions were, on the whole, Greek, though the plan and interior vaulted spaces suggest a strong Roman influence.

In 1798 Latrobe persuaded the city of Philadelphia to use his steam-pump plan, rather than the proposed canal system, for providing good water. Though continually opposed by the canal interests, by 1801 he was able to have a wooden pipe system put into use, thereby fulfilling the city's needs. The pump station, known from paintings and engravings, comprised a structure with a square Doric base and a windowed cylinder topped with a dome. This was the first successful venture of the sort in America.

Latrobe was the first to introduce the Gothic style to residential architecture in America, in his design for Sedgeley (1798–99), the suburban Philadelphia home of William Crammond.

A fortunate meeting with Thomas Jefferson led to Latrobe's appointment in 1803 as architect of the U.S. Capitol in Washington (I, PL. 79). Originally designed by William Thornton and partially finished under the guidance of a succession of architects, the building had only its north wing prepared for Congress at the time Jefferson became President. Latrobe completed the south wing, using the original design for the exterior and making some changes on the interior. After the Capitol was burned by the British in 1814, the architect retained the exterior walls but redesigned and rebuilt the interiors of both the north and south wings. He also proposed a design for the central unit with a well-proportioned dome; but this segment was never built, and in 1817 he resigned because of disagreement over the nature of his position.

While supervising the Capitol, Latrobe was able to fulfill several other architectural commissions, most notably that for the Cathedral of the Assumption in Baltimore (I, PL. 81). The Cathedral, essentially in its original state, is one of the few Latrobe buildings still standing. Two sets of plans were offered to Bishop Carroll and the building committee in 1805 — one Neo-Gothic, the other neoclassic. The latter design was chosen, and construction was substantially completed when the Cathedral was dedicated in 1821.

The Baltimore Exchange (1816–20; destroyed 1904) was, on the the exterior, one of Latrobe's least interesting works. It was a monotonous design except for the imposing dome, which rose on pendentives to a height of 115 ft. over the floor of the Exchange — the most daring exercise in masonry in

America at the time. Only two other notable buildings of Latrobe exist essentially unchanged. The fine-proportioned "Old West" of Dickinson College (Carlisle, Pa.) was designed to replace a structure destroyed by fire in 1802 but was not seen by the architect until 1811. The Louisiana State Bank, New Orleans, was begun in 1819 but was not yet completed when Latrobe died the following year during an epidemic of yellow fever.

Latrobe brought a high standard of taste and beauty in the application of the neoclassic style, and contributed much to the knowledge of engineering and construction in the United States. Most important of all, he trained a number of architects of the next generation (including Robert Mills, William Strickland, and William Small) in the craft of building durably and tastefully.

Paul F. NORTON

LAURANA, LUCIANO. Architect (also called Luciano di Martino da Laurana, Lauranna, Dellaurana, and Luciano da Urbino). Although it is certain that Laurana came from Dalmatia, the date of his birth is unknown, and Lovrana, Vrana, Urana, and Zara (Zadar) have all been advanced as the location. He died in Pesaro in 1479. The Laurana problem is one of the most intricate in the history of early Renaissance architecture. Highly praised by his contemporaries in the years immediately following his death (Giovanni Santi, *Cronaca*, ed. H. Holtzinger, Stuttgart, 1893), his name was then forgotten for centuries. Vasari is chiefly responsible for this neglect, for he failed to mention Laurana in his *Lives* and ascribed to Francesco di Giorgio (q.v.) the creation of the Palazzo Ducale (PLS. 96–100; FIG. 168) at Urbino. Among the few monuments attributable to Laurana, this imposing construction seems most clearly to bear his imprint.

It was not until the 19th century that historical research began to reconstruct the artistic identity of Laurana. Newly discovered documents revealed that the palace at Urbino was not the conception of a single architect but the work of several, among them Laurana, whose role was substantial (G. Milanesi, in his comments for Vasari's *Lives*, II, *passim*). Early in the 20th century intensive stylistic analysis coordinated with the documentary evidence led to additional attributions, which included the much-discussed architectural perspectives in Urbino (Gall. Naz. delle Marche), Baltimore (Walters Art Gall.), and Berlin (Staat. Mus.). Finally, the hypothetical opera of Laurana were increased with ingenious but often unsupported and implausible attributions (A. Venturi). In reaction, there followed an elaborate reappraisal, wherein Roberto Papini, representing one tendency, went so far as to repudiate almost entirely the Laurana attributions of earlier critics and the very career they outlined. For the most part, however, such reevaluation took the form of careful definition and separation, of intensive analyses of related documents and the stylistic traits of the works in question. As awareness of the difficulties of the problem grew, the need for clarifying Laurana's role became unmistakable, along with the obstacles hindering the task: the lack of documents and their sometimes contradictory nature, the heterogeneous mass of the Urbino palace, and the inaccessibility of the fortress of Pesaro (still used as a penal institution), an authentic — and the final — work of Laurana. For these reasons, there is as yet no definitive conformation of the Laurana personality, from either a documentary or a stylistic point of view. Although Milanesi's hypothesis — that Laurana was the pupil of Brunelleschi — based on a passage from Vasari's *Lives* ("a Slovene who did a number of things in Venice") is provocative, it is corroborated neither by documentation nor by traces of such buildings. In the present state of the research, the attribution to Laurana of the gate of the Arsenal in Venice (on the landward side) remains purely an inference.

Some reflection of Alberti (q.v.) in Laurana's work, at least as an object of inspiration, is reinforced by his presence in Mantua before 1465, in the decade of the building of Alberti's first project for S. Sebastiano; by his adoption of Roman architectonic motifs in the courtyard of the Palazzo Ducale of Urbino, such as the tondos between the arches and the frieze inscription (derived from the Tempio Malatestiano at Rimini of Alberti; I, PLS. 51, 52); by his use of capitals nearly identical with ancient examples to be seen in Rome and Latium; and in the stately, harmonious proportions of his masterwork. Further

Urbino, Palazzo Ducale. (*a*) Section, east-west. (*b*) Plan of the first floor: (1) main courtyard; (2) Throne Room; (3) Sala della Jole; (4) Sala degli Angeli; (5) Sala delle Udienze; (6) *studiolo* of Federigo da Montefeltro; (7) loggia of the west façade.

suggestion of dependency on Alberti appears in the disposition of the loggias on the west façade of the palace (PL. 96), which recalls the favored Alberti device of superposed arches and apertures accenting the vertical axis of the façade — used first in the Rimini work and later in S. Sebastiano in Mantua (I, PL. 56). One must not be misled to another tenuous attribution by analogies between the Laurana façade for the Palazzo Ducale and the triumphal arch of the Castel Nuovo in Naples (III, PL. 390), which was built ten years earlier. In the Neapolitan structure the Albertian inspiration common to both monuments was implemented (probably by the Mallorcan Guillén Sagrera and assistants) with a poorly understood classicism, in imitation of the mere externals of antique models; whereas the loggias at Urbino were realized in purely architectonic terms, with subtly calculated proportions subordinated to considerations of perspective and light, so as to achieve coloristic effects across the façade.

Although Laurana was very likely indebted to Alberti, he declined to follow the Albertian propensity for masking the structure with marble incrustations or facings and with stucco painted or decorated in sgraffito. He turned instead to effects of light and shade achieved by the modeling of the building itself: the chromatic contrast of colored bricks with the limestone framework, the shadowed disks of the hollowed-out tondos between the arches of the main courtyard, the narrow rims above the windows, the absolute sobriety of the window framing, and the great dark hollows created by the loggias on

the west façade. In this concern with light and shade and with perspective, Laurana demonstrates not only his relationship with Venetian art but also his unquestionable affinity with Piero della Francesca (Salmi, 1945; R. Longhi, *Piero della Francesca*, Rome, 1927). These characteristics alone would suffice to remove Laurana's name from consideration as the architect of the Mantegnesque courtyard of the Castello di S. Giorgio in Mantua, where the delicate ornamental garlands and painted surfaces of the spacious arcade create an effect more pictorial than architectural. Furthermore, documents suggest that the S. Giorgio courtyard was executed about 1472 by Luca Fancelli after the design of Mantegna (Cottafavi, 1939). The only link between the structures at Mantua and Urbino is their common Albertian inspiration.

Among the minor works assigned to Laurana in Mantua is the "occhio di portico," in the street leading to S. Andrea (Venturi, 1923), but the remnants are insufficient to permit definite attribution.

The documents attest to Laurana's stay for a brief period at the court of Alessandro Sforza in Pesaro during the early months of 1465. There is also reason to believe that he returned to Pesaro in January, 1466. It is likely that on the latter occasion Laurana presented some designs for the Palazzo Ducale at Pesaro, part of which were already in existence in 1462. The principal façade appears to have been near completion in 1472. The Pesaro palace manifests none of the strict proportion and classical simplicity of the courtyard at Urbino, thus suggesting that Laurana's plans were distorted in the execution. This conclusion is supported by documents lately brought to light (Franceschini, 1959), which indicate that in March of 1466 — shortly after his second journey to Pesaro — Laurana had already completed a model for the Palazzo Ducale. The discordant impression produced by the impossibility of aligning the six arches of the portico, raised on massive piers, with the five windows of the upper story may have been dictated by exigencies of perspective. A correspondence not noted heretofore is to be found in a contemporary illustrated text, the *Tavolette di Perugia* (1473), in which there appear façades arranged on noncoincident axes like those of the Pesaro palace. The sculptural decoration of the palace was executed in 1476 by Domenico Rosselli, in keeping with the practice of submitting every sizable edifice to copious, more or less legitimately architectonic embellishments. Such decorative overlays did not reflect Laurana's intentions.

Though Laurana had yielded to the imposition of such sculptural additions on other occasions, it is likely that in Urbino he firmly resisted the customary excesses of the army of stone masons and decorators swarming about the construction, in order to attain the absolute precision of proportion and carving which characterizes those parts of the Palazzo Ducale attributable to him. His refusal to accept their handiwork is implied by the litigations in which he was involved during 1467 at Urbino (where he had probably taken up residence the previous year), before he obtained from Duke Federigo da Montefeltro the well-known letter of patent as chief architect of the palace. Laurana directed the palace construction until about the middle of 1472, that is, for almost six years. Probably at the end of August of that year, for unknown reasons, he left Urbino, never to return. From there he went to Naples, where he served the house of Aragon in the position of "master of artillery."

Modern critics have exhaustively analyzed the structure of the Palazzo Ducale. Laurana's fundamental problem was to join two existing buildings: the Palazzetto della Jole, a proto-Renaissance palace added to and remodeled by Laurana, and a medieval keep known as the Castellare. His plan had to take account of a sharp incline of the land on the west, as far as the Mercatale sector of the city, as well as a difference in levels between the Palazzetto and the Castellare on the east. Esthetically he faced the problem of finding a suitable monumental façade for the complex exterior and a corresponding solution for the interior.

These were also the years when Cardinal Pietro Barbo (later to become Pope Paul II) was finishing in Rome the arcaded garden (1464) of Palazzetto Venezia and a sizable portion of the great palace of the same name. In 1468 the Cardinal was planning for the Palazzo Venezia a huge courtyard with a two-tiered arcade, which remained unfinished, however. For Federigo da Montefeltro — gonfalonier of the Church, *condottiere*, Humanist, and devotee of antiquity — Laurana was required to supply a residence more modest in size but equal, if not surpassing, in beauty that of the prince of the Church.

Laurana's conception of the tower façade was a striking innovation for Renaissance palaces; it was to be admired not from an adjacent piazza but from the streets leading to the countryside in the west and from the valley below. In the main courtyard (PL. 99), altered with a later superstructure, Laurana used modular ratios that establish a regular rhythm: arcs, circles, and squares distributed with vertical and horizontal interrelation. The sides of the court are terminated by double pilasters at the corners (PL. 100). In order to lend an immobile, crystalline purity to his geometry, Laurana slightly raised the round arches. To create an impression of greater space he exaggerated the perspective by resorting to entasis in the imposing monolithic columns and by placing the windows in shadowed recesses. Furthermore, to ensure appreciation of the courtyard from a perfectly centered approach, he placed the entrance hall very high and put the palace entrance on the same axis, considerably off center in respect to the east façade on Piazza Duca Federico (PL. 98). In so doing, Laurana renounced all conventional practices with regard to the principal portal, a decision that caused unavoidable anomalies in the design for the two east façades. Faced with an already compromised situation, the architect had to decide between a unified courtyard entered by way of an unpleasing façade or a harmonious exterior façade leading into an irregular courtyard. Laurana chose the "perfect" courtyard, adhering strictly to his own ideal.

Laurana's strong interest in perspective explains, and in part justifies, the above-noted attribution of the three perspective panels to him, though closer analysis has led to their inclusion in the ambit of the Sangallos (Sanpaolesi, 1949).

Before leaving Urbino, Laurana had probably planned and partially supervised work on the Throne Room (PL. 97), the Sala delle Veglie, the Sala degli Angeli, the Sala delle Udienze, the hanging gardens, and the grand staircase, in addition to other, minor elements. The details of Laurana's work on the Palazzo Ducale described above and the innumerable additions and modifications that followed are matters to which critical analysis must certainly turn again.

The second important project in which Laurana's participation has been verified is the citadel of Pesaro, the Rocca Costanza. By order of Costanza Sforza, the foundations of the fortress were laid in May, 1474. Although it has not been shown that Laurana was present at that time, he was certainly active in the construction in 1476, again in 1478, and finally in 1479, the year in which the courtyard was completed. Laurana's style is readily discernible in the austere form of the citadel, a four-sided structure of geometric regularity, with cylindrical corner towers that perhaps recall the Aragonese towers then to be seen in southern Italy and the neighboring islands. The characteristic juxtaposition of limestone and brick recurs, as does the extreme sobriety of the moldings, particularly in the functional cut of the crenels.

Laurana had some part in the building of another citadel, the Rocca of Senigallia, whose architect (possibly Baccio Pontelli) apparently borrowed from the design of the Rocca Costanza, but without striving for the same geometric purity. Laurana's contribution was restricted to the design of a connecting bridge, which documents testify was under construction at the end of 1479, the year of his death. Pontelli seems to have lived and worked in Urbino sometime between 1479 and 1482, when he went to Rome, thus making him — if he did design the citadel of Senigallia — the last military architect to employ Laurana's forms. Later, however, Pontelli worked in the less rigorous and more adaptable style of Francesco di Giorgio, who had trained under Laurana in Urbino. The style of Donato Bramante (q.v.), another decisive figure in Renaissance architecture, also reflects the influence of Laurana.

Illustrations: PLS. 96–100; 1 fig. in text.

LAWRENCE, THOMAS. English portrait painter (b. Bristol, 1769; d. London, 1830). Lawrence was the son of an excise official turned innkeeper, who in 1773 took over the Black Bear at Devizes. Here the boy Lawrence made pencil likenesses and acquired a reputation as a prodigy. In 1782 he moved with his family to Bath and practiced in pastel, and in 1787 he went to London, where he began to work in oil. Lawrence appears to have been almost entirely self-taught.

In 1789 he exhibited at the Royal Academy of Arts a full-length portrait of Lady Cremorne (Coll. Lt. Comdr. C. Windham), brilliantly modeled if somewhat gaudy in color, which led directly to an introduction to Queen Charlotte and to a commission to paint her portrait. The result was Lawrence's first masterwork; in it he toned down some of the vulgarities of *Lady Cremorne*, and in the background first revealed his decided gift for landscape painting. The royal portrait was exhibited at the Royal Academy in 1790, together with *Miss Farren*, a more vivid and more obviously romantic portrait that caught the public fancy. From this time on, Lawrence had consistent success. He became an associate of the Royal Academy in 1791, succeeded Reynolds as Painter-in-Ordinary to the King in 1792, and became a full member of the Royal Academy at the earliest admissable age in 1794.

Throughout the 1790s Lawrence produced portraits of sustained brilliance. He was a splendid draftsman, but facility was his weakness, and it is clear that his taste was very uncertain. He tended to work for surface effect, employing too many highlights and exaggerating the vitality of his sitters. In a mistaken if laudable belief that he should attempt narrative painting, he exhibited *Satan Calling His Legions* (Royal Acad. of Arts) in 1797, which he believed was his finest achievement. Sensitive to the almost unanimous criticism of the press, however, he attempted nothing else of the kind.

From about 1800 there was a noticeable sobering in Lawrence's style and more marked variation in the quality of his work. The good was better and more controlled than before (*Family of Sir Francis Baring*, 1807), but other work was inexplicably careless. About this time he was frequently in financial difficulties. With the death of John Hoppner in 1810, Lawrence was without a rival and had by then recovered the balance in his production. In 1815 the prince-regent knighted him, and in 1818 he was sent to Aachen and Vienna to paint the allied victors of the Napoleonic Wars. From Vienna Lawrence went to Rome; and on his return to England in 1820, he was elected president of the Royal Academy to succeed Benjamin West. The portraits painted on this European tour hang in the Waterloo Chamber of Windsor Castle; of these, *Pope Pius VII* and *Archduke Charles* are masterpieces of his mature style. Lawrence never ceased being ready to learn; the whole European series reveals his response to the works of Titian and Velázquez that he was able to study in the imperial collections in Vienna.

In the work of his last decade Lawrence often tended to sentimentalize, but these years also produced some of his strongest studies of character. His death at the age of sixty was an undoubted loss, for he continued to be prolific and had not ceased to develop. The artist was also a notable public figure and a great connoisseur. His collection of old-master drawings was perhaps the finest yet made. He never married, but his love affairs with the daughters of Mrs. Siddons were well known.

LEBANON. The Lebanese state was created in 1920 as a result of the dissolution of the Ottoman Empire. Placed under French mandate, it was known first as Great Lebanon (Fr., Grand Liban) and later (1926) as the Lebanese Republic, the name which it retained after achieving independence in 1944. From the art-historical point of view, Lebanon is closely bound to Syria (q.v.). In antiquity the area was included in the theater of Phoenician art (see PHOENICIAN-PUNIC ART) and entered into the history of the more comprehensive region lying between the Euphrates and the Nile valleys (see SYRO-PALESTINIAN ART), up to and throughout the Hellenistic period and after — first under Alexander, then under the Seleucids, and finally as part of the Roman province of Syria. Long contested by the Byzantines and Sassanids, the territory was later conquered by the Arabs. The Crusaders left behind numerous works of religious and military architecture; there are fewer monuments from the period of Turkish domination. In the 20th century Western influences have permeated the art and architecture, but they are sometimes overlaid with traditional Levantine characteristics.

SUMMARY. Artistic and cultural epochs (col. 172). Art centers and monuments (col. 178).

ARTISTIC AND CULTURAL EPOCHS. Because of its geographic position, Lebanon has been the meeting place and throughway of the land and sea routes of those regions where the first great cultures of the ancient world developed: Mesopotamia, the Nile Valley, and the Mediterranean basin. As a result it has preserved numerous vestiges of the past.

The antiquity of the primitive inhabitants of the land is attested by paleolithic and neolithic remains. From the 3d millennium B.C. successive waves of Semitic invaders superimposed and intermixed their cultures. These peoples, traditionally called Amorites and Canaanites, together with Aramaic peoples who appeared on the Biqa plain near the end of the 2d millennium B.C., gave the country its original physiognomy and formed its ancient linguistic, religious, cultural, and social traditions. The transformation of nomadic tribes into sedentary peoples, the beginning of building in stone, the early use of writing, and the development of a mythology emanating from the land gave this culture its essential characteristics.

The most thoroughly documented foreign influence in this early epoch is the Egyptian, as is shown by the excavations of Byblos (see below). As early as the 3d millennium B.C. Egyptian objects of the Old Kingdom were buried in a foundation deposit together with locally produced articles of Egyptian influence. These include various figurines and a seal with hieroglyphs and figures, on which the local goddess Baalat is depicted with the characteristics of an Egyptian deity.

The vitality of the artistic tradition of the Nile Valley in the territory is still more effectively proved by finds from the beginning of the 2d millennium. In this period an Aegean influence appears side by side with the Egyptian and, although more limited in scope,

is just as decided. The royal tombs in Byblos (12th dynasty) have yielded pectorals decorated with falcons, bronze *harpés* (ceremonial axes) decorated with the uraeus or with Egyptian hieroglyphs, and scarab seals, as well as other objects bearing royal inscriptions of Amenemhet III. The coexistence of objects in the Aegean tradition reveals the presence of an eastern Mediterranean influence considerably prior to the invasion by the Peoples of the Sea (ca. 1200 B.C.), which populated the Phoenician coast with Philistines. These Aegean objects include a long-spouted silver pitcher and other vessels that are similar to Minoan teapot vases (see PL. 422); a basin decorated on the rim with a network of spirals; and a gold- and silver-inlaid dagger such as those found at Mycenae (IV, PL. 71). Much later, at the end of the 2d millennium, in the tomb of Aḥīrām, an ivory with Mycenaean decoration lay next to part of a vase with the cartouche of Ramses II. Even at the periphery of Egyptian influence, objects from the necropolis of Kfar el-Jarra — engraved stones, majolica tiles, gold rosettes — reveal that, among other influences, that of Aegean art was dominant in the first half of the 2d millennium.

From the middle of the 2d millennium, more numerous Egyptian documents and local sources — especially the Tell el'Amarna letters — show that the Pharaohs, in their politics of expansion after the expulsion of the Hyksos, succeeded in establishing dominion over Byblos, Beirut, Sidon, and Tyre. In the artistic field, although Egyptian influence is widely documented, elements of typically continental Asian tradition appeared and were disseminated by these cities, which were emporiums open to all commerce and consequently sensitive to artistic and cultural activity. Evidence of this is found in the use of the *harpé* as a royal emblem (even if of local make and with Egyptian decoration), in the Syro-Hittite cylinder seals, in the torques characteristic of the Caucasus, and in the style of the figures on the sarcophagus of Aḥīrām (IV, PL. 453). At the end of the 2d millennium, in the period following the Egyptian-Hittite struggle, the Egyptian lotus-flower motif was still used in the sculptured decoration of objects such as the famous sarcophagus of Aḥīrām. Egyptian influence is also evident in the temple architecture of the epoch at Byblos and in the colossal statues found there.

After the destructive invasion of the Peoples of the Sea, the great cities, such as Sidon and Tyre, revived in the early centuries of the 1st millennium. External artistic influences did not lose their vitality. In this epoch evidence of relations with Egypt is to be found chiefly in the stone sarcophagi discovered in the necropolises of Sidon and Byblos. This practice of inhumation in a sarcophagus, together with that of mummification, was certainly imported into Phoenicia from Egypt. In Sidon, in the early 5th century, the anthropomorphous sarcophagus of Egyptian origin replaced the ancient indigenous theca. The sarcophagus of King Tabnit (XI, PL. 132) is a reused Egyptian piece, while the 25 sarcophagi of the Ford Collection in the National Museum, Beirut, are local productions of Egyptian inspiration. The Phoenician convention of organizing relief decoration in horizontal registers comes from Asian, specifically Assyrian, models. Persian influences have been found, at Sidon, in capitals sculptured with double protomas of bulls; at Umm el-Aḥmād, in steles; and, at Khara'ib, less clearly, in terra-cotta figurines.

The abundance of Tanagra types in the last-named figurines, excavated from a favissa and datable from the 4th to the 1st century B.C., illustrates unequivocally the decline of Egyptian and Eastern influences to the advantage of the almost immediately dominant Hellenistic Greek. When the Lebanese territory (which had been annexed by Cyrus to the Achaemenid Empire in 539 B.C., becoming part of the Fifth Satrapy) fell to Alexander in 333 B.C., Greek art was already highly prized, as is shown by the series of fine, large sarcophagi of Greek marble, from Sidon, in the Archaeological Museum, Istanbul. Unquestionably executed within Phoenician lands by Greek sculptors, they include the "Sarcophagus of the Satrap" (mid-5th cent. B.C.); the Lycian sarcophagus (ca. 400 B.C.), decorated with lion- and boar-hunting scenes; the "Sarcophagus of the Mourning Women" (mid-4th cent. B.C.; III, PL. 379); and the famous "Alexander Sarcophagus" of the early Hellenistic period, with representations of hunting and war scenes (VII, PLS. 151, 152). The decoration of hypogea with paintings of flowers, birds, and mythological scenes can also be related to Greek art. At Alexander's death, after the battles of the Diadochi, the territory of what is today Lebanon fell into the hands of Seleucus I Nicator; it did not, however, remain a stable possession of the Seleucids, because the Ptolemies of Egypt had designs on it. The defeat of Antiochus III at Magnesia (190 B.C.) and the treaty of Apamea (ca. 188 B.C.) confirmed the triumph of Rome in the Syrian coastal territories.

Thereafter, Roman inspiration was manifest primarily in fine lead sarcophagi and in limestone sarcophagi decorated with garlands. Later the influence of imperial Rome was just as strong, fostered above all in the Roman colonies of Berytus (mod. Beirut) and Heliopolis (mod. Baalbek). Typical is the sculptured decoration of the temples at Baalbek. A stylistic study of the Corinthian capitals of the Great Temple and of the sculptured ceilings of the monumental altar in the rectangular court has identified the combined activity, in the 1st century of the Christian Era, of local workshops, with strong local traditions, and of Roman workshops, which had developed in the western Augustan tradition of the Ara Pacis. The Roman builders of the temples of Baalbek had to submit to the requirements of the ancient local rites.

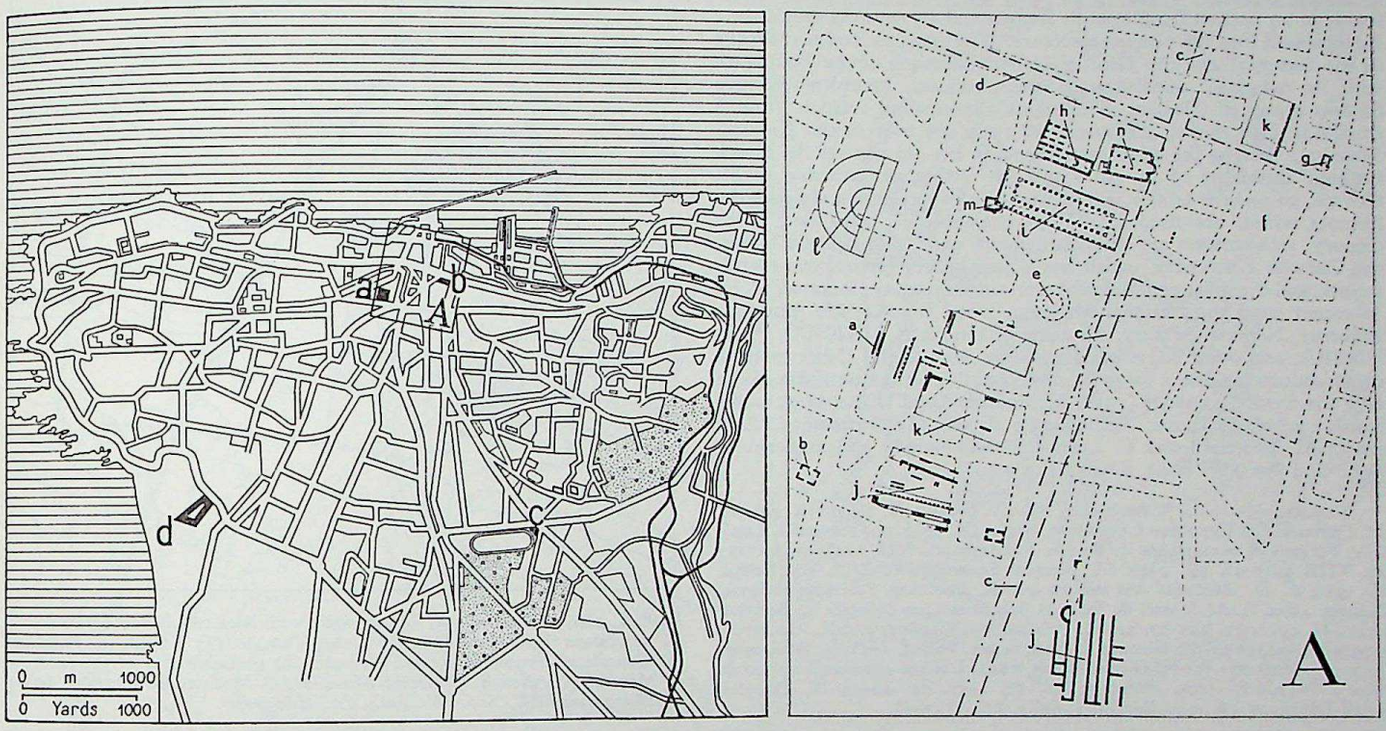
In contrast, the introduction of Christianity in Lebanon was not marked, as it was in northern Syria, by a renewal of architecture and ornamental decoration. Moreover, architectural remains of early Christian buildings are rare. They were generally reused in later constructions, as in the basilica at Baalbek, the Great Mosque of Beirut, and the no longer extant basilica at Tyre. While the imperial edicts resulted in the building of a few early Christian basilicas, their application also did irreparable damage, of which the ruins of Baalbek offer sad testimony.

Paul COLLART

The transition to Byzantine rule took place smoothly in the east, but the Syrian territories were troubled, from 500 to 628, by the tenacious battle between the Byzantines and the Sassanids. After the Arab conquest (ca. 636) and with the decline of the Abbasside caliphate in the 9th century, the region fell successively into the hands of the Tulunids (868–905), the Ikhshidids (935–69), and the Fatimid caliphs of Cairo (969–1171). There was a parallel development of an Islamic type of art, of which, for the period preceding the Crusades, all trace has disappeared; Christian tradition and artistic activity, on the other hand, have remained constant elements in Lebanese history. The emperors of Byzantium, Nicephorus II Phocas and Basil I, attacked the coast of Lebanon and sacked the cities. With the final defeat of the Byzantines at Manzikert (mod. Malazkirt), in 1071, the safeguarding of eastern Christianity was taken up by the Crusaders; thereafter the Latin kingdom of Jerusalem was formed. With the annexation of Tripoli in 1109, Beirut in 1110, and Sidon at about the same time, Crusader buildings sprang up throughout the region.

Noteworthy are the remains of military architecture from this period along the coast. Imposing castles and fortresses dominate the strategic points of the region, and walls, towers, and city gates are still to be seen in almost all the coastal towns. The most important and best preserved are the castles of the Embriaco family in Byblos, of St. Louis in Sidon, of Raymond de Saint-Gilles in Tripoli, and of Beaufort (or Belfort; Ar., Qal'at al-Shaqīf). This last, built of large stone blocks in 1139, passed from Fulk V of Anjou, king of Jerusalem, to the lords of Sayette, who rebuilt it and sold it to the Knights Templars in 1260; it was greatly restored in the 17th century by the amir Fakhr ad-Dīn. Also notable is Toron, a circular castle near Tibnīn, which was erected in 1104 by Hugh de Saint-Omer, taken by Ṣalāh ad-Dīn (Saladin) in 1187, and dismantled in 1219 by the sultan Malik Mu'aẓẓam; rebuilt in 1229, it passed to the Montforts and then to al-Ẓāhir Baybars and was rebuilt once more in the 17th century. The Castle of Akkār (near Tripoli), erected in the 11th century by Muḥriz ibn-Akkār and considerably remodeled throughout the centuries, was held successively by the Fatimid caliphs of Egypt (1033–94), by the Turks, by the Franks (from 1109), and by al-Ẓāhir Baybars (from 1271). Many other fortresses are now mostly in ruins.

Examples of religious architecture of the period of the Crusades survive, for example, in the Great Mosque, the small Frankish chapel, and the Church of St. George in Beirut; in the Church of St. John the Baptist and adjoining baptistery in Byblos; in the churches of St. George (built on Roman walls) and Mār Fūqās (St. Phocas; late 12th cent. with Byzantine paintings), and others in ruins at Amyun; and in Notre-Dame-du-Vent at Enfe. A great many chapels, hermitages, and sanctuaries are scattered in the foothills of Qurnat al-Saada; many of them are decorated with wall paintings of Byzantine influence. Paintings of the 13th century are still extant in the Grotto of St. Marina near Tripoli. Among the many important monastic buildings of the Crusader period are the Cistercian Abbey of Belmont (Deir Balamand; founded 1157; now Orthodox), preserving the ancient church, bell tower, and parlor; the Monastery of Deir Qannūbīn, near Diman, apparently dating from the time of Theodosius the Great (379–95) and the residence of Maronite patriarchs from the 15th century on, in the church of which are 15th- and 16th-century paintings; the Maronite Monastery of Deir al-Qal'a, built on the remains of a Roman temple; the Monastery of Mār Elias near Shuwayr; and the Monastery of St. John above the village of Khunshara. Because of the difficult political and military situation, not much architecture was created in the following period, and that which remains is of little interest. As early as 1187 the army of Ṣalāh ad-Dīn recaptured the capital; only Tyre, under the guidance of Conrad of Montferrat, succeeded in resisting, but in the following century it too fell, as did



Lebanon, principal centers of archaeological and artistic interest. *Key*: (1) National boundaries; (2) monuments and prehistoric remains; (3) Phoenician and Aramaic centers; (4) Persian and Hellenistic centers; (5) Roman centers; (6) centers with Byzantine and medieval monuments; (7) centers with Islamic monuments.

other cities that had been reconquered by the Christians. In the 13th century the Mamelukes reached the coast and were not driven away until 1516, by the Ottoman prince Selim I. They did not succeed, however, in leaving an architectural imprint on the land, which always retained a certain independence from the Ottoman Empire.

Lebanon is in fact poor in Islamic monuments of any importance; the existing monuments are either remodelings of the period of the Crusades or additions and completely new constructions of the Mameluke and Ottoman periods. Moreover, this modest architectural heritage from Islam has no local stylistic characteristics whatsoever, since these buildings belong to the general development of Mameluke and Ottoman art of Syria.

In the early 17th century the amir Fakhr ad-Dīn, who traveled to Italy and visited the court of Cosimo II de' Medici, had the Sidon bridge built by Italian architects (1631) and requested "fountain masters" and "inspired . . . gardeners" from Italy. With the resurgence of building activity, arising from an intense economic development, European influences were assimilated and fused with traditional elements. Of particular note are the examples of Arab and Turkish military architecture, such as the Qal'at Jubayl, a fortress near Tibnin, and the Castle of Shema (in ruins), and those of Christian religious architecture, such as the monastery of Mār Abda at Deir el-Qamar and the Armenian monastery of Bzummār. The imposing palace at Bayt al-Dīn was built in the early 19th century. With its arcades, galleries, domes, and towers, the structure is without doubt Lebanon's major monument of Islamic secular art. The first government buildings of the principal cities were also built in the 19th century. The Turkish sultanate's concession, in the 1860s, of a greater degree of autonomy and a Christian military governor for Lebanon resulted in closer political and cultural contact with Europe. The Ottoman government, or Sublime Porte, ended in 1914. Industrial and commercial prosperity in the 20th century has brought about important urban development, particularly in the port cities, with the creation of whole new quarters and residential areas outside the old centers. The many buildings (scholastic complexes, ministries, banks, international organization offices such as FAO, UNESCO, and UNRRA in Beirut) that have been erected since World War II indicate a virtual abandonment of local traditions and the affirmation of an architecture bound to the most modern currents.

ART CENTERS AND MONUMENTS. Beirut (Phoenician, Brt; Βηρυτός; Λαοδίκεια ἡ ἐν Φοινικίῃ; Colonia Iulia Augusta Felix Berytus; Beyrut). The ancient city, whose name appears in the letters of Tell el 'Amarna, was an important Phoenician port. Isolated finds from there are now in the National Museum. A sphinx of Amenemhet IV testifies to relations with Egypt. The Hellenistic-Roman city, destroyed at the time of Antiochus VII (ca. 138–129 B.C.), was rebuilt by the Romans when Marcus Agrippa founded a colony there in 15 B.C. Traces of the Roman city, destroyed by an earthquake in 551, have been found. Tentatively identified from the remains are the areas of an eastern and a western forum; the basilica, with an interior colonnade of the Ionic order and an exterior one of the Corinthian order; and baths. North of the eastern forum there are remains of private houses and of a building, perhaps a temple, from which came a monumental torso, now in the National Museum.

Seat of an archdiocese from the 4th century, Beirut was occupied by the Arabs in 635 and was repeatedly besieged during the Crusades. After the brief reign of Jean I d'Ibelin (1205–36) it again fell into the hands of the Mamelukes. The first settlements of French and Italian merchants date from the 15th century. In 1516 the city became part of the Ottoman Empire, though its amirs preserved a certain independence from the central power. Under the amir Fakhr ad-Dīn (1583–1635)

Beirut entered into commerce with Italian cities (Venice, Florence, etc.) and enjoyed a period of prosperity. Briefly falling under the Egyptian domination of Muḥammad 'Alī in 1831, the city was bombarded and returned to Turkey in 1840 by an Anglo-Austro-Turkish fleet. In 1920 it became the capital of Lebanon under the French mandate. After Lebanon gained independence in 1944, there began a period of development that has made the city one of the principal port cities of the Middle East. Today the old city, lying between the sea and the heights of Ras Beirut, Mār Elias, and Ashrafiya, is surrounded by modern quarters (Christian and Moslem), which have grown up around the main highways to Tripoli, Sidon, and Damascus. Villas and parks are scattered over the surrounding heights. The only large ancient monument completely intact is the Great Mosque (Jāmi' al-'Omarī), a Moslem adaptation (1291) of the preceding Christian church dedicated to John the Baptist, built 1113–50 on a Byzantine building, which, in its turn, was constructed from the remains of an ancient temple; both Roman and Byzantine capitals were incorporated into the present structure. The Jāmi' al-Sarāyā (Mosque of the Seraglio) and the Jāmi' al-Naffāra (Mosque of the Fountain), with its octagonal minaret and white cupolas, complete Beirut's modest group of Moslem monuments. Interesting frescoes from a small Frankish chapel, discovered in 1941, are now in the National Museum. Among the other monuments in the old city are the Greek Catholic Cathedral of St. Elias and the Orthodox Cathedral of St. George, an ancient edifice with a women's gallery and a cloister (the frescoes within are modern). Fine examples of 19th- and 20th-century architecture are the parliament and town-hall buildings, the Catholic University, which has a rich library of precious manuscripts, and the great complex of American University (founded 1866). In recent years the National Museum, Hotel Biarritz, the American Embassy, National Library, Academy of Fine Arts, UNESCO, FAO, UNRRA, and other office buildings have been built. Other modern constructions include a large hospital complex on the outskirts of the city; the women's college (1957; M. Ecochard and C. Lecoeur, architects); a scholastic center, Amlié (1957; Hojeil); the Protestant College (1957; M. Ecochard and C. Lecoeur); the enlarged and modernized port; and the airport at Khalde.

Bayrūt, I, 1959, pp. 1137–38.

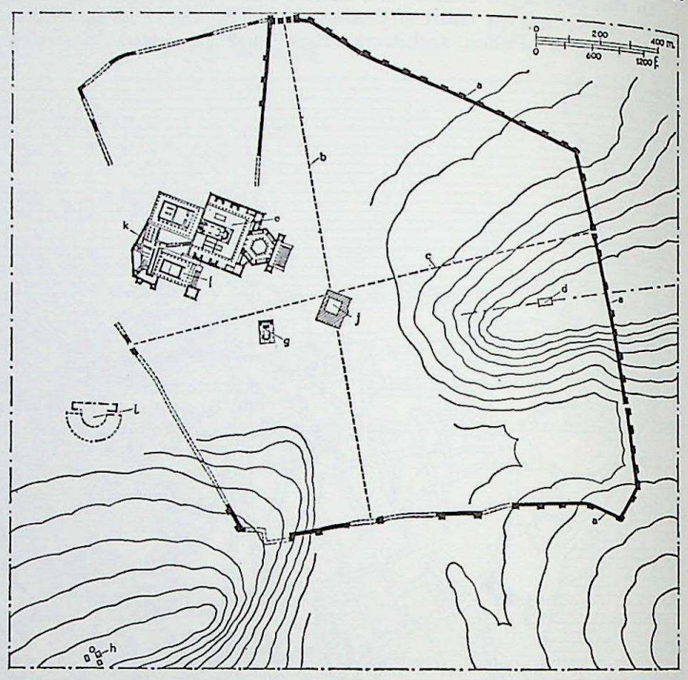
Afqa. In front of the cave of this name, near the sacred Spring of Adonis, are the remains of a Roman temple. The plan is highly uncertain, but it was built in part on artificially leveled ground and had a piscina to the northeast of the enclosing wall. This sanctuary, famous in antiquity, was dedicated to Venus. Tradition says the temple was destroyed by Constantine, but it is possible that the complex was still intact in the 5th century.



Bibliog. D. Krencker and W. Zschietzschmann, Römische Tempel in Syrien, I, Berlin, Leipzig, 1938, pp. 56–64.

'Ain Harsha. On a height near this village is a well-preserved Roman temple, rather provincial in style, of the second half of the 3d century. It is a building *in antis* of modest proportions, interesting for the curvature of the entablature, supported by columns with Ionic capitals, at the entrance to the adytum.

Bibliog. D. Krencker and W. Zschietzschmann, Römische Tempel in Syrien, I, Berlin, Leipzig, 1938, pp. 245–55.

Baalbek (Ἡλιούπολις; Colonia Iulia Augusta Felix Heliopolis). The construction of the famous monumental complex here was begun in the 1st century and never completed. The Great Temple, dedicated to the Heliopolitan triad (Jupiter, Venus, and Mercury), was probably pseudodipteral; construction must have begun in the second half of the 1st century. It stands on a high terracelike base, and parts of the external colonnade, having unfluted shafts and frieze consoles with lion and bull protomas, are still standing. A large, complex, five-story altar and an interior staircase leading to an upper terrace were built in Flavian times. A minor altar, also on the sanctuary axis, rose between the major altar and the Corinthian decastyle façade of the temple. The vast rectangular court, dominated on the west side by the temple façade, was finished in the first half of the 2d century. It was surrounded on the other three sides by an inner colonnade and an outer enclosing wall, along which rectangular and semicircular exedrae alternated; between the column shafts of pink granite could be seen the decoration of a double tier of niches adorned with statues, both within and between the exedrae. This group was completed about the middle of the 3d century with the erection of the hexagonal forecourt, arcaded and encircled by large exedrae, and preceded by a wide propylaeum, the portico of which is flanked by two large towers decorated with pilasters in two superposed orders.

Possibly in the 1st, but more likely in the 2d, century another temple was erected, parallel to the long axis of the Great Temple, but on a lower level and structurally unrelated to it. Traditionally called the "Temple of Bacchus," this edifice was, according to recent

Baalbek, plan of the city. (*a*) Roman walls with later rebuilding; (*b*) *cardo* (?); (*c*) *decumanus* (?); (*d*) aqueduct; (*e*) Great Temple; (*f*) Temple of Bacchus; (*g*) Temple of Venus, or Round Temple; (*h*) probable site of the Temple of Mercury; (*i*) theater; (*j*) Great Mosque; (*k*) Moslem fortifications (*after E. Honigmann, RE. Sup. IV 1924, s.v. Heliupolis*).

hypotheses, also dedicated to the Heliopolitan triad and intended for specific mystical rites. The building was raised on a high podium, and most of the colonnade, with its double row of columns in front of the pronaos, is still intact. A huge doorway leads into the cella, also in good condition; its walls are decorated with engaged columns, arched niches, and pedimented aediculae. The adytum, on a higher level, was reached by a short staircase. Not far from the monumental complex is the small central-plan Temple of Venus, or Round Temple (restored). An elegant example of the Hellenistic baroque, its base and entablature had a concave profile between the columns.

Occupied by the Moslems in 634, Baalbek was repeatedly destroyed during the Middle Ages. It became part of the Ottoman Empire in 1516. Two earthquakes, in 1667 and 1750, further damaged the ancient remains. The city encircles the artificial terrace on which the temples and the ruins of Crusader fortifications are found. At the center of the courtyard of the temple complex (described above) is a Christian basilica built on Roman foundations; it dates from the 4th or, perhaps, the 6th century.

Bayt al-Dīn. The famous palace here was built early in the 19th century for the amir Bashīr II (1788–1844). Now the residence of the president of the republic, it was built in pure Islamic style by architects from Damascus. Its arcaded courts, salons, and galleries were described by Lamartine, who stayed there for a time in the early 1830s.

Bibliog. R. Boulanger, Lebanon, Hachette World Guides, Paris, 1955; A. de Lamartine, Voyage en Orient (ed. Lotfy Fam), Paris, 1959.

Beziza (Bziza). In this hilltop town near Amyun rise the ruins of an Ionic prostyle temple, possibly of the Flavian period. The building, without a podium, has a handsome doorway and a cella enriched with shell-shaped niches.

Bibliog. D. Krencker and W. Zschietzschmann, Römische Tempel in Syrien, I, Berlin, Leipzig, 1938, pp. 4–7.

Byblos (mod. Jubayl; Phoenician, Gbl; Βύβλος; Βίβλος; Gebal; Jebeyl). The acropolis of Byblos occupies a promontory situated between the entrances to two valleys, approximately 25 miles north of Beirut. Stratigraphic excavations have permitted the identification of a succession of 15 periods from very ancient times to the Arab conquest. Up to the end of the 4th millennium B.C. three successive settlements can be distinguished, each of which is characterized by different types of dwellings and burials as well as by the evolution of stone tools and pottery. At the beginning of the 3d millennium an urban community was formed. Larger dwellings, the first temples, and a fortified wall were built, while the use of metal and wheel-turned fired pottery spread. The brilliant pre-Amorite period (ca. 2700–2150) was distinguished by spacious and well-built structures, by the remodeling of the temples and the defense system, and by the variety and elegance of its pottery. After a period of disturbance and destruction came the Amorite period (ca. 2150–1725), during which rich deposits of offerings were placed in sanctuaries, the Temple of Baalat Jubayl was reconstructed, and the temple with obelisks consecrated to Resheph and two other temples were built. Also contemporary are the four important hypogea in the royal necropolis, with limestone sarcophagi of the 12th dynasty and an abundant supply of funerary objects — pottery, pectorals, and weapons, often of precious materials. During the rule of the Hyksos (ca. 1725–1580) and the Egyptians (1580–1200) the temples remained in use and new tombs were added to the royal necropolis. The names of the princes of Byblos under the rule of Tyre (1200–734 B.C.), of Syria and Babylonia (734–539 B.C.), and of Achaemenid Persia (539–322 B.C.) have survived in inscriptions, among which is one, most important for its antiquity (ca. 1000 B.C.), found on the sarcophagus of Aḥīrām. According to the inscription on the stele of Yeḥawmilk, the Temple of Baalat Jubayl was restored and cult objects added to it in the Persian period. The Hellenistic-Roman age was characterized by considerable building activity: a Roman temple, a basilica, a nymphaeum, and a theater, from which comes a fine mosaic with a bacchic scene (Beirut, Nat. Mus.).

Byblos (mod Jubayl), plan (A = zone of ancient city; B = medieval and modern area). Principal monuments. Phoenician period: (*a*) bastions; (*b*) fortress; (*c*) Temple of Baalat Jubayl; (*d*) Temple of Resheph; (*e*) royal hypogea. Roman period: (*f*) colonnades; (*g*) temple; (*h*) basilica; (*i*) nymphaeum; (j^1) theater (moved now to j^2). Medieval period: (*k*) walls; (*l*) castle of the Embriaco family (12th–13th cent.); (*m*) Church of St. John the Baptist and Baptistery (*from M. Dunand, 1937*).

Occupied in 1104 by the Crusaders under the command of Raymond de Saint-Gilles, the city (called Giblet by the Crusaders) was ceded in 1109 to the Genoese Embriaco family. It subsequently passed into the hands of Ṣalāh ad-Dīn, who dismantled the fortifications, and was returned to Frankish rule in 1199, under the lordship of Guy de Giblet. In 1266 Byblos fell to the Turks. The present-day city, which is surrounded by walls with towers and few openings, still partly preserves its medieval aspect; remains of towers are also still visible on the arms of the small harbor. At the southeast corner of the walls rises the rectangular castle of the Embriaco family (later Frankish), with a strong keep and surrounded by a moat. At the center of the city stands the triple-apsed Church of St. John the Baptist (begun 1115), the western half of which was entirely destroyed and only recently rebuilt; adjoining the church is a baptistery, dating from about 1200.

Biblo, II, 1959, pp. 99–102. *Medieval and modern era*: R. Boulanger, Lebanon, Hachette World Guides, Paris, 1955.

Deir el-'Asha'ir. Near this village, on the frontier with Syria, are the ruins of a prostyle temple with a vast podium — which can be dated no later than A.D. 179 on the basis of an inscription — and a cella, whose portal is flanked by niches. Characteristic of the Mt. Hermon region are the complex crypt and the interior decoration of the cella with pilasters.

Bibliog. D. Krencker and W. Zschietzschmann, Römische Tempel in Syrien, I, Berlin, Leipzig, 1938, pp. 256–64.

Deir al-Qal'a. The remains of a Roman temple are still visible. Some of the structural elements indicate that it dates from the 1st century, or perhaps later. It is prostyle, with a pronaos extended by means of columns added at its sides; two of the colonnade shafts jut out at the corners. The interior is finished with engaged columns. A Maronite monastery now rises on the temple ruins.

Bibliog. D. Krencker and W. Zschietzschmann, Römische Tempel in Syrien, I, Berlin, Leipzig, 1938, pp. 1–3.

Ḥiṣn al-Safiri (Sfire). Of the three sacred Roman buildings now lying in ruins in this locality, the 1st-century Temple B, *in antis*, is characterized by an adytum on a higher level than the cella, from which it is separated by two columns. Temple C, also 1st-century, was decidedly smaller but of similar construction and enclosed an older sacellum. Temple A, the largest of the sanctuaries, was built at the beginning of the 3d century; on both outside and inside walls it has rhythmically alternated pilasters with jutting plinths.

Bibliog. D. Krencker and W. Zschietzschmann, Römische Tempel in Syrien, I, Berlin, Leipzig, 1938, pp. 20–34.

Kfar el-Jarra. On a small hill near this village has been found a complex of tombs dating from the first half of the 2d millennium B.C. The finds from the necropolis (necklaces, bronze daggers, pottery, lances, a scarab), which seems to have been in use for a long time, reveal relationships with the Aegean world, as well as Egypt (12th–18th dynasties).

Bibliog. P. E. Guigues, Nécropoles de la région sidonienne, BMBeyrouth, I, 1937, pp. 35–76, II, 1938, pp. 27–72.

Khara'ib. Trial digs have brought to light a favissa with numerous terra-cotta statuettes and some coins. Other small images were found under the paving of a building of rectangular plan, which was discovered in the vicinity of the village. The statuettes — representing divinities, youths, dancers, and musicians — reveal Egyptian, Persian, and, particularly, Hellenistic influences; they have been associated with local agrarian and fertility cults and with Greek mystery rites. As confirmed by presumably contemporary coins, they date from the late 4th to the late 1st century B.C.

Bibliog. M. Chehab, Les terres cuites de Kharayeb, BMBeyrouth, X–XI, 1951–54.

Lib'a. Near this village, about 9 miles east of Sidon, there are six extant tombs, which contain fragments of pottery and weapons. The tombs probably date from the 18th or the 17th century B.C.

Bibliog. P. E. Guigues, Nécropoles de la région sidonienne, BMBeyrouth, III, 1939, pp. 53–63.

Mejel 'Anjar. This village south of Baalbek is the site of a peripteral temple with flattened bosses on the exterior walls. In the interior there are engaged Ionic columns, semicircular niches, and aediculae with alternating curvilinear and triangular pediments.

Bibliog. D. Krencker and W. Zschietzschmann, Römische Tempel in Syrien, I, Berlin, Leipzig, 1938, pp. 182–91.

Nahr el-Kelb (Λύκος; Lycus). The sides of the canyon which this river has carved out of a steep promontory approximately 9½ miles north of Beirut are famous for the many rock-cut inscriptions left there through the ages by passing armies. On the right bank of the river only one inscription (No. 1) has been identified — that of Nebuchadnezzar II, the king of Babylonia (605–562 B.C.). On the left bank the oldest inscriptions are Nos. 14 and 16, which commemorate the passage of Ramses II (13th cent. B.C.). These also include a relief with the Pharaoh executing a prisoner before a statue of the sun god. Flanking inscription No. 14, which forms a rectangular slab, is an Assyrian inscription, not positively identifiable, curved on the top to reproduce the classic form of the Mesopotamian stele and depicting a king in prayer. Most important among the other Assyrian reliefs (Nos. 6, 7, 9, and 15) is that of Esarhaddon, with a monumental inscription referring to his Egyptian campaign. Other inscriptions on the rocks are both ancient (Latin, No. 3; Greek, No. 12) and modern (English and French).

Bibliog. H. Winckler, Das Vorgebirge am Nahr el-Kelb und seine Denkmäler, Leipzig, 1909; R. Mouterde, Le Nahr el-Kelb, Beirut, 1932.

Niha. Here are found the ruins of two prostyle temples: Temple B (1st cent.), with a single row of columns on the front, and the massive, tetrastyle Temple A, which has Ionic engaged columns with jutting bases and trabeation on the interior. The latter temple, which repeats the features of the interior of the oldest sacred building at Deir al-Qal'a, is attributed to the 2d century. Not far from Niha is Ḥiṣn Niha, particularly noteworthy for Great Temple A (2d cent.), with the pilasters projecting rhythmically from the walls, a device typical of other Syrian sanctuaries of the 2d and 3d centuries.

Bibliog. D. Krencker and W. Zschietzschmann, Römische Tempel in Syrien, I, Berlin, Leipzig, 1938, pp. 105–37.

Qal'at Faqra. In this locality are the remains of a large Roman temple (first half of 1st cent.), with a columned portico and a large court. The so-called "Mausoleum of Q.F." rises from a podium with a pseudoperipteral upper structure on which are inscriptions referring to the time of Claudius; it may have been used for worship, rather than as a tomb.

Bibliog. D. Krencker and W. Zschietzschmann, Römische Tempel in Syrien, I, Berlin, Leipzig, 1938, pp. 40–55.

Qaraya (Qraya). In this village, 5 miles southeast of Sidon, has been found a tomb from the time of Thutmosis III, containing pottery that clearly shows Mycenaean and Cypriote influence. These remains, found along with a type of pottery that is common in both Egypt and Syria, provide evidence of Aegean influence on the Phoenician coast about the middle of the 2d millennium B.C.

Bibliog. P. E. Guigues, Nécropoles de la région sidonienne, BMBeyrouth, III, 1939, pp. 53–63.

Qaṣr Naus. Here rise ruins of a Roman monumental complex, of which the most important sacred building is the prostyle temple (probably 2d cent.). The temple walls are decorated with protruding pilasters without bases, as well as arched niches and aediculae.

Bibliog. D. Krencker and W. Zschietzschmann, Römische Tempel in Syrien, I, Berlin, Leipzig, 1938, pp. 8–19.

Sarafand. Near this village is the ancient city of Sarepta (Akkadian, Ṣariptu; Heb., Sarefat; Σάρεπτα; Zarephath), where there was a fortified stronghold at the time of the Crusades. From it comes the torso of a statue now in the Louvre; an interesting aspect of this figure is the dress, with a skirt having ornamental motifs that terminate in the form of a uraeus.

Bibliog. G. Contenau, La civilisation phénicienne, 2d ed., Paris, 1949, pp. 157–58, fig. 18.

Sidon (Phoenician, Ṣdn; Σιδών; Ar., Sayda). The topography of the ancient port, which was divided into four sectors, has been discerned. One of the few extant sanctuaries of the Phoenician period is the Temple of Eshmun, the ruins of which, lying against the slope of a hill, suggest either a stepped construction or a massive bastion extending toward the valley. The sacred character of the building is verified by some inscriptions, found between the blocks of stone, which mention King Bodashtart. The tombs found in the necropolises around Sidon are sometimes very complex in their structure and plan. They have yielded many sarcophagi of great artistic interest; the oldest examples found there are in the shape of a theca. Of particular importance, because of their utterly Egyptian character, are those of King Tabnit (XI, pl. 132) and Eshmunazar II (Louvre), although Egyptian influence appears in other coffins dating back to the Persian period. In addition, four notable marble sarcophagi of Greek workmanship have been found. Funerary objects found in the tombs consist principally of pottery of the Seleucid epoch and lamps

of Greek type. Tombs of the early Christian Era nearly always contain cippi; much more rarely they contain painted limestone steles, and in one case investigation has disclosed a large mosaic stele, probably of the 4th century. The first centuries of the Christian Era produced sarcophagi which greatly vary in form, appearance, and material; two fine examples, of lead, are in the Louvre.

Seat of a bishopric under the Byzantine government, Sidon was occupied in 637 by the Arabs, who changed its name to Sayda. Taken by the Frankish Crusaders in 1111, it surrendered in 1187 to Ṣalāh ad-Dīn, who razed the fortifications. Reoccupied by the Crusaders in 1197, the city was again destroyed by the Saracens in 1249 and then fell once more to the Franks, who definitely abandoned it in 1291. In the 17th century the amir Fakhr ad-Dīn attempted a reconstruction of the city, although he closed the port to keep out the Turkish fleet. The French settlers played an important role in the commercial life of the city until they were dismissed by the pasha Jezzar in 1791. After the earthquake of 1837 the city was rebuilt and encircled with new walls; in 1840 the harbor fortifications were once again destroyed by an Anglo-Austrian fleet. One of the city's oldest architectural monuments is the 13th-century fortress Qal'at al-Baḥr, built on an island that is situated at the mouth of the harbor and composed of two large towers joined by a wall. Mostly in ruins, this building still shows architectural elements of pure 13th-century French style. The Castle of St. Louis — so called because, according to tradition, the saint once stayed there — dates back to the 12th century, but was almost completely rebuilt by the Arabs. The Great Mosque (Jāmi' al-Kabīr) rises on the site of the Church of the Knights of St. John. Many of the khans built by the amir Fakhr ad-Dīn during the 17th century are still extant. One of the most important of rectangular plan, surrounded by galleries and loggias, it was residence of the French consul in the 19th century.

Tripoli (Τρίπολις; anc. Tripolis; Ar., Tarabulus). Because of the lack of archaeological evidence, no secure data for the ancient city, already a flourishing port in Greco-Roman times, exist. A few ruins of little value and uncertain provenance were brought to light during work in the modern city. Some interesting facts, however, are furnished by Arrian and Strabo, who report that the city was divided into three large quarters, each fortified with a wall.

Occupied by the Moslems in 638, the city experienced a series of political vicissitudes until it was besieged by Raymond de Saint-Gilles and finally conquered by a coalition of Crusader forces in 1109; after this it became a Crusader stronghold for about 180 years. Under Frankish domination churches, monasteries, and hospitals were built, and it became the seat of a bishopric and an important industrial and commercial center. In 1187, with the extinction of the dynasty of Toulouse, the city passed to the ruling house of Antioch. With the fall of Antioch in 1289, Tripoli also fell into the hands of the Mameluke sultan Qalā'ūn, who through territorial concessions to the Moslems, built the present-day city on the banks of the Nahr Abū-'Alī, at the foot of the Frankish castle, as well as a series of fortifications on the sea, of which a few ruins are still extant today at el-Mina. Between 1516 and 1918, under the Ottoman Empire, the city slowly declined. After the city was joined to Lebanon in 1920, it became the administrative capital of the northern region. The aqueduct, the so-called "Arches of the Prince" (still partially standing), and a considerable number of 13th-century architectural remains in the medieval quarter of Hamman Izz ed-Dīn date from the Crusader period. While the Great Mosque rose on the site of the ancient cathedral, Ste-Marie de la Tour, and utilized its ruins, the 14th-century Mosque of Taylān seems to be a purely Islamic construction. Next to the Great Mosque there is a mausoleum of the same century with a magnificent monumental portal; nearby are the small mosque of Saqraqiya (now a residence) and the Qurtāi Bey, with a large ablution basin. The castle of Raymond de Saint-Gilles (Qal'at Sanjil) was rebuilt in the 14th century by the amir Asandmir Kurgī. Other Islamic monuments, in what is unquestionably the most interesting Lebanese center in this respect, are the Lion Tower (Burj es-Sibā'), built on the sea by the amir Aydamūsh (late 14th cent.); the monastery (tekke) of the Maulawiya dervishes; the Mosque and Madrasah al-'Aṭṭār; the Mosque of the Tanners; and the Mosque al-Tūba. In the last decades modern quarters and residential centers with numerous office and store buildings of Western style have been built, and the harbor has also been enlarged.

Bibliog. G. Le Strange, Palestine under the Moslems, London, 1890, pp. 348–52; E. Honigmann, RE, s.v. Tripolis, no. 4, 2d ser., XIII, 1939, cols. 203–07; R. Boulanger, Lebanon, Hachette World Guides, Paris, 1955.

Tyre. (Phoenician, Ṣr; Akkadian, Ṣurru; Heb., Zor; Τύρος; Tyrus; Sur). Uncertainties still exist about the ancient topography of the great Phoenician city, approximately 53 miles south of Beirut. Although the present site is on a peninsula, it is known that the earliest settlement was on an island about a half mile from the shore, whence

Tyre, zone of ancient city. (1) Modern town. Principal archaeological remains; partly submerged: (*a*) southern or "Egyptian" harbor; (*b*) breakwaters, (*c*) entrance to the harbor; (*d*) west entrance; (*e*) ruins of the embankment; (*f*) the breakwater of the spring; (*g*) spring; (*h*) tomb; (*i*) northern or "Sidonian" harbor, submerged ruins of the breakwater (*from A. Poidebard*).

the Semitic names, meaning "rock," perhaps derived. Scylax noted, under the name Palaityros, the separate settlements that eventually developed on the adjacent coast because of the pressure of population growth. The ancient harbors were located through the underwater explorations conducted by A. Poidebard, who identified a northern and a southern port. Foundations of the breakwaters have been found and suggest construction in the period between the end of the Hellenistic era and Roman times. At Jel el-'Amad, in the immediate vicinity of the city, a hypogeum tomb with decorative paintings of the Roman period has been discovered. At Tell el-Ma'shuq stone slabs and parts of a stairway leading to a large building (probably a temple) have been found, in addition to many fragments of pottery, mosaics, and coins, which are datable from the 5th century B.C. to the early centuries of the Christian Era.

Occupied in 636 by the Arabs, Tyre became part of the Latin kingdom of Jerusalem in 1124. In 1231 the city was conquered by an expedition sent out by Frederick II, who held it until 1243. Abandoned by the Crusaders in 1291 and subsequently destroyed by the Moslems, its ruins were used as a quarry for building materials. In the 17th century the amir Fakhr ad-Dīn tried, unsuccessfully, to reconstruct the city. The sands have gradually covered the ruins and closed the port, though remains of the triple wall of the Crusader period and ruins of towers are visible here and there on the sandy dunes. Of the large basilica, begun in 1127 on the ruins of a 4th-century basilica, all that remains is part of the peripheral wall, which is stripped of its ancient facing. The modern-day development of the town has produced no notable constructions.

Umm el-Aḥmād. This locality, south of Tyre, was excavated in 1860 by E. Renan and in 1921 by M. de Lorey, who brought to light remains of two Hellenistic temples. The excavations have yielded

some fine funerary reliefs, among which are a stele in the Louvre, depicting a female figure making an offering, and that of Baalyaton in the Ny Carlsberg Glyptotek, Copenhagen.

LEBRUN (LE BRUN) CHARLES. French painter, designer, and decorator (b. Paris, 1619; d. Paris, 1690). His father, Nicolas, was a sculptor; his elder brother, Nicolas, was a painter; and one of his younger brothers, Gabriel, also painted but was best known as an engraver. The young Charles showed a precocious talent and was sent to study under François Perrier. He attracted the attention of the Chancellor of France, Pierre Séguier, on whose *hôtel* his father was working. Séguier sent him to Simon Vouet (q.v.) for further training. Lebrun was soon dissatisfied with the minor tasks he was given and left to pursue his own studies at Fontainebleau. The paintings of his early years show the influence of these two masters. *Hercules and Diomedes* (Nottingham, City Mus. and Art Gall.), painted for Cardinal Richelieu, is a vigorous composition reminiscent of Perrier and suggesting a familiarity with Rubens; *The Crucifixion* (Moscow, Pushkin Mus.) follows a Vouet type; while *The Martyrdom of St. John* (Church of St-Nicolas-du-Chardonnet) combines stylistic elements from both his masters in a work that is audacious in conception and brilliant in execution. The minor works (designs for frontispieces, theses etc.) show the same precocious ability to challenge his elders on their own ground. In his six etchings, particularly the four of a satyr family symbolizing the times of day, the physical types from Vouet's repertory are etched in the rough technique of Perrier. A lost *Annunciation* must have shown Lebrun working in a sober, somewhat heavy style, closer to that of Philippe de Champaigne (q.v.), and turning toward a simpler, more classic art.

In 1642 Séguier sent him with a pension to Rome. There he came under the influence of Nicolas Poussin (q.v.), who probably encouraged him to copy antique statues (sketchbook presented to Séguier; Paris, Bib. Nat., Ms. fonds fr. 17217), as well as the frescoes of Raphael and the Carraccis. He also painted a *Pietà* (Louvre; PL. 103) and a *Death of Cato* (Arras, Palais St-Vaast), a work of almost Caravaggesque intensity, with rugged, unclassical figures like those of the *Hercules and Diomedes*; his *Horatius Cocles Defending Rome* (London, Dulwich College Picture Gall.) and *Mucius Scaevola* (Mâcon, Mus. B. A.) reflect various aspects of Poussin's art.

On his return to Paris in 1646 he was occupied with numerous commissions, and by 1648 he was sufficiently established to play a prominent part in the foundation of the Académie Royale de Peinture et de Sculpture. Yet his style was not fully formed. His two altarpieces commissioned as May offerings for Notre-Dame, *The Martyrdom of St. Andrew* (1647) and *The Martyrdom of St. Stephen* (1651), both in Notre-Dame, show the influence of Domenichino (q.v.), while the small altarpiece for the Church of St-Paul et St-Louis, the *Bénédicité* (Louvre), has a monumental quality recalling the work of Andrea Sacchi. In the paintings for friends, such as *The Brazen Serpent* (Bristol, City Art Gall.) and *The Massacre of the Innocents* (London, Dulwich College Picture Gall.), Lebrun used numerous small figures and groups to show the psychological effects of an event on the various people involved, much as Poussin had done in *The Gathering of the Manna*.

During the 1650s Lebrun formed from these elements the style which can be noted in *The Feast in the House of Simon* (Venice, Accademia), *The Repentant Magdalen* (Louvre), *Christ in the Desert Served by Angels* (Louvre), all commissioned for the convent of the Carmelites in the Faubourg Saint-Jacques; in *The Crucifixion with Angels* (Louvre), commissioned by the Queen Mother for her oratory; and in *The Pentecost* (copy in Louvre) for St-Sulpice.

Soon after his return from Rome he began the series of decorations that was to culminate in his work at Versailles. Although its execution was spread over several years, the earliest design must be that of *The Apotheosis and Marriage of Hercules* for the gallery of the Hôtel Lambert. Here that standard baroque trick, the illusion of a ceiling broken through to show a sky peopled with gods and goddesses, increases the effect of height in a low gallery. The long, narrow shape necessitated subdivision into square fields, which are linked by flying figures below the dividing arches. By the use of imitation tapestries Lebrun was able to introduce into this scene two other scenes of Hercules' earthly triumphs, without violating the principle of the unities. In the two rooms of the Hôtel de la Rivière (now Mus. Carnavalet) that Lebrun painted in 1653 the sky scenes are surrounded by a deep coving, the decoration of which in one room includes eagles and putti modeled in relief. In the central scenes the illusionistic foreshortening, restrained in the Hôtel Lambert, is reduced to a minimum.

In Vaux-le-Vicomte, the château of Nicolas Fouquet, Lebrun showed his decorative talents to the full. His studied avoidance of steep foreshortening creates a classic harmony, accepting the architectural facts of wall and ceiling; in some rooms the richness of the coloring is enhanced by the combination of painted scenes with stucco supporting figures in full relief, a technique derived ultimately from Pietro da Cortona (q.v.). It was for Fouquet that Lebrun first demonstrated his versatility, designing tapestries for his patron's weavers at Maincy and preparing brilliant fêtes at Vaux.

In 1660 Lebrun was summoned to Fontainebleau by Louis XIV and ordered to paint a scene from the life of Alexander; he selected the theme of the magnanimous victor for his painting, *The Family of Darius before Alexander*. The scene takes place on a shallow stage, with only a brief glimpse into the distance; Alexander, Hephaestion, and the family of Darius with their servants form a double line, allowing the expression of each figure to be seen in succession (cf. etching version, IV, PL. 432). This combination of richness in the individual elements with a simple friezelike arrangement exemplifies Lebrun's compromise with classic severity. This picture was to become the foundation of Lebrun's career, and appropriately so, for it is his masterpiece as well as a manifestation of those elements most typically his own and most eagerly imitated by his successors.

The following year he painted another of his most successful works, the equestrian portrait of Chancellor Séguier (Louvre; PL. 102). The gold, white, and blue-gray coloring gives it a cool splendor, and in its quiet simple dignity and the severity of its composition it is the classical answer to the baroque equestrian portraits of Rubens and Van Dyck. In the handling of the paint it has a freshness and vigor which his later works too often lack.

The year 1661 marks a turning point in Lebrun's life. With the fall of Fouquet he entered the service of the King, and from then on his energies were devoted to the glorification of Louis XIV. In 1662 he was put in charge of the new Manufacture Royale des Meubles de la Couronne (the Gobelins manufactory). There he controlled the complete production of furnishings for the royal palaces, ensuring that uniformity of style which, even now, when so much has been lost (the silver furniture was afterward melted down), is such a striking feature of Versailles. The best-known of these Gobelins products are the tapestries, the *Elements*, *The Seasons*, *The Battles of Alexander* (reproducing Lebrun's paintings in the Louvre; PL. 101), *The Family of Darius*, *The History of Louis XIV* (cf. PL. 103), and *The Royal Palaces* (also known as "The Months"). All were intended, directly or indirectly, to celebrate Louis XIV, his victories, and his magnificence. The publication of engravings from these designs served to spread further the renown of Louis and, incidentally, that of his Premier Peintre.

The King set Lebrun to work first on the Palais des Tuileries (since destroyed) and on the Louvre, where the Galerie d'Apollon, which he never finished, remains one of the most splendid memorials to the Sun King. The varied use of white and gilded stucco to frame, support, and expand the painted scenes, interspersed with panels of arabesques, creates a rich three-dimensional effect.

But it is Versailles which provides the most united and complete example of Lebrun's work. The Grands Appartements were decorated between 1671 and 1681 under his direction, while Lebrun himself decorated the magnificent Escalier des Ambassadeurs (destroyed) and planned a ceiling painting for a chapel. In 1679 he began the designs of the Galerie des Glaces (Hall of Mirrors; II, PL. 212; V, PL. 409), on which he worked till 1684, and the ensemble was completed in 1686 with the Salon de la Paix and the Salon de la Guerre (PL. 104). Each scene on the ceiling of the Galerie is framed within an architectural structure and surrounded by putti, satyrs, caryatids, genii, and trophies, of which only a small part of the framework and the trophies on the heavy cornice are in actual relief. Here, as in several other rooms, the walls are covered with colored marble, arranged in rectilinear designs. This formal severity of the walls and the framework circumscribing the pomp and grandeur of the paintings reflects the rigid protocol that controlled the splendor of court life. The paintings are triumphs of 17th-century allegory, in which the King retains his majestic calm in the midst of battles fought for him by Hercules and Minerva and the full story of a campaign is compressed into a single picture.

Lebrun supplied designs for much of the garden sculpture of Versailles and for the decoration of the châteaux of Saint-Germain-en-Laye and Marly-le-Roi; he prepared decorations for state occasions and still had time for frontispieces and allegorical illustrations of theses and for religious paintings such as his *Louis XIV Adoring the Risen Christ* (1674, Lyons, Mus. B.A.; PL. 103). In the early 70s he decorated the chapel of Colbert's villa at Sceaux and the dome of the Pavillon de l'Aurore (PL. 104) in the garden.

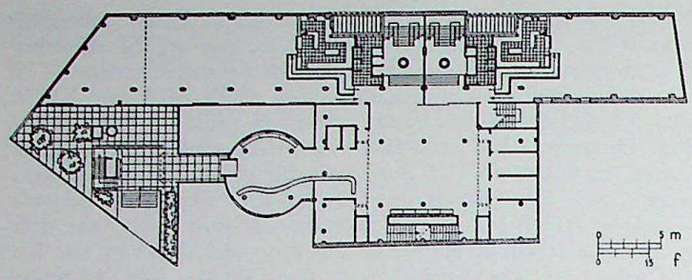
To help with these tasks Lebrun built up a corps of artists; some were specialists in animal painting, in still life, or in landscape, living at the Gobelins and not aspiring to the Académie, but many of the academicians also cooperated with Lebrun and worked from his designs. With so much royal patronage dispensed by Lebrun, it was an advantage for artists to adopt the style he favored, but even a rival, such as Pierre Mignard, painted in the same manner. His rise in 1668 to life chancellor of the Académie and his assumption of the directorship in 1683 were in part the result of intrigue, but he was well suited for this authority, both as an artist and as an organizer, and the political ability by which he acquired power for himself was used with equal skill to steer the Académie through its difficult early years. In close cooperation with Colbert he raised the Académie's position to the point that he could negotiate for union on equal terms with the older Accademia di S. Luca in Rome; in both 1676 and 1677 the Roman academicians accorded him the honor of electing him *principe*.

He had a sound grasp of the purpose of the Académie, using it to ensure the dignity of painting and sculpture as liberal arts and to establish a doctrine, based on rational rules, comparable to the rules of grammar, rhetoric, and poetics that the Académie Française was devising for the French language. His discourses on the paintings of Raphael and Poussin and his defense of drawing as opposed to color are outstanding. His illustrated lecture of 1669 on the expression of the passions, a subject so important for the elaborate history paintings of the time, was printed in full in 1698 (*Méthode pour apprendre à dessiner les passions*, Paris; cf. III, PL. 206) and was widely used and reproduced many times during the next two centuries. His discourse on physiognomy, designed to complement it, was printed only in 1806, and then in a misleading form (*Dissertation sur un traité de Charles Le Brun concernant le rapport de la physionomie humaine avec celle des animaux*, Paris).

In 1683 Colbert died; since his successor, Louvois, favored the rival Mignard, Lebrun soon found his authority contested even at the Gobelins and Versailles. He needed the stimulus of large commissions, and the neglect he now experienced — in part deliberate, in part the inevitable result of Louis XIV's financial difficulties — hurt his pride and dried up his inspiration. He painted and presented to the King small-scale religious scenes, crowded, full of erudite incident, and prepared with great care, but pictorially dull. *Moses Defending Jethro's Daughters* (1686) and *Moses Marrying Sephora* (1687) are now in Modena (Gall. Estense); of the proposed series of the life of Christ only *The Raising of the Cross* (1685), *The Adoration of the Shepherds* (1688), *Christ Bearing the Cross* (1688), and *The Entry into Jerusalem* (1689) were completed (all in the Louvre).

The emergence of France during the second half of the 17th century as the dominant power in Europe produced a new self-consciousness and the need for an art that would reflect this new ascendency, create a setting fit for the court of the Sun King, and challenge the hitherto unquestioned superiority of Italy. The painter who achieved this was Lebrun; he created the style of Louis XIV, which was imitated by lesser princes and established the French artistic hegemony of Europe. Based on a study of Raphael, the Carraccis, Domenichino, and, above all, Poussin, but reflecting also the different tradition of Rubens and Pietro da Cortona, it was a compromise which avoided both the severity of the late Poussin and the flamboyant exuberance of the full baroque.

Immensely competent, a sure and sometimes brilliant draftsman, an intelligent and conscientious historian, Lebrun had little sense of color, and his interest in narrative values all too often submerged his esthetic sensibility. He deployed the figures in his pictures like actors; each must be viewed as a separate statement. For this reason it is not surprising that of the 2,000 or more of his drawings in the Louvre about three-fourths are figure studies.



By the time of his death Lebrun was a disappointed man; yet his achievements were great and lasting. He had built up one of the most successful bodies of artists and craftsmen in the history of art, which produced one of the most splendid palaces in the Western world, and he had created the most influential of academies, which controlled French art for more than two centuries.

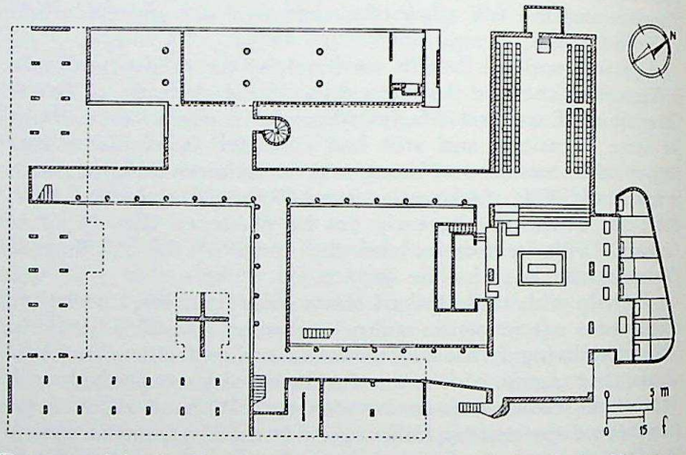
LE CORBUSIER. Pseudonym of Charles-Edouard Jeanneret (b. La Chaux-de-Fonds, Switzerland, Oct. 6, 1887), architect and city planner. After studying printmaking at the local art scool, Le Corbusier was directed toward architecture by his first important teacher, the painter Charles L'Eplattenier, and his first buildings were erected in Switzerland in 1904–06. Soon thereafter he began a protracted period of travel. In 1907 he was in Italy; next he visited Budapest and then Vienna, where he met Josef Hoffman. At Lyons in 1908 he met Tony Garnier and afterward moved on to Paris, where he spent 15 months with Auguste Perret (q.v.). In 1910–11, years spent for the most part in Germany, he passed several months with Peter Behrens (q.v.) in Berlin and also participated in the Deutscher Werkbund exposition at Munich. During 1911 he traveled in the Balkans and Asia Minor and revisited Italy. In 1917 Le Corbusier settled in Paris, where he still lives; here

Paris, Salvation Army hospice, plan of reception areas (*from A. Sartoris, Gli elementi della architettura funzionale, Milan, 1941*).



he produced his first paintings (PL. 105), took part in his first exhibit in 1918, and initiated the Purist movement with Amédée Ozenfant. In 1920, again with Ozenfant, he founded *L'Esprit Nouveau*, a review they published until 1925; in 1922, with his cousin Pierre Jeanneret, he set up an architectural studio and also exhibited architectural projects at the Salon d'Automne (Citrohan houses, "Immeubles-Villas," and a contemporary city for 3,000,000 inhabitants). This early work was followed by extensive and uninterrupted activity on an international scale and dedicated participation in the solution of problems of avant-garde architecture. The principal organizer of the first International Congress of Modern Architecture (CIAM) in 1928 at La Sarraz, Switzerland, Le Corbusier was also the animating force in its subsequent gatherings; at the fourth Congress, held in Athens in 1933, the basic principles of modern architecture were articulated under his influence and were later published (*La Charte d'Athènes*, 1943). In 1930 he became a French citizen, and in 1935 he made his first trip to the United States, where his ideas had by then created a marked impression.

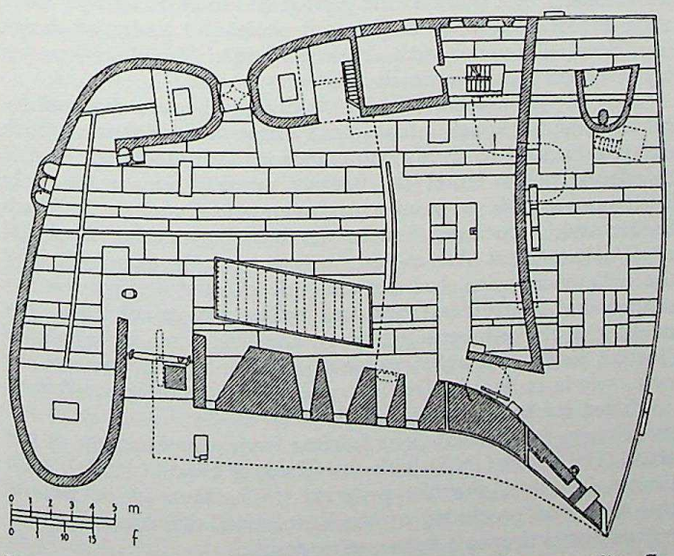
It is relatively easy to detect the component influences in the early development of Le Corbusier. The decorative rationalism of the Nancy school (V. Prouvé, Souriau) was instilled in him by L'Eplattenier. Perret must have sought to interest him in "harmonic structuralism." Behrens elicited his interest in the problems of architecture and form posed by industrial needs and methods. Garnier proposed ambitious solutions to

Poissy, Savoye house: (a) Floor plan; (b) cross section.

the planning problems of industrial cities. Contact with the Werkbund must have provoked reflection on the social role of art and architecture in modern life. Acquaintance with the theories of Adolf Loos (q.v.) introduced an attitude of formal and decorative asceticism, while cubist developments assuredly influenced his own Purist efforts. But, far from inhibiting or diluting the creativity of Le Corbusier, these complex elements assimilated from contemporary culture merely served to accent his significant personal contribution. In the light of the marked originality of his ideas and total work, discerning appraisal of his extraordinary talent for synthesizing effectively what were often little more than diffuse theoretical outlines must strongly qualify the importance attached to these borrowings, for in the process of integrating them into a distinctive and fruitful architectural order Le Corbusier gave them new power and worth. In truth, his contribution to the contemporary renewal of architecture consisted not only of questioning the traditional rules but, above all, of rearranging them according to the rhythm of his own time. He reconstructed the family dwelling by defining the "machine for living" (*la machine à habiter*), with which he sought to replace the undifferentiated shelter that the traditional home offered. Seeking to reorganize the structure of cities, he began by classifying their functions and went on to inject an artistic element of grandeur into his urban scheme. In order to accomplish many of his new ideas, he even revised construction methods through industrializing building procedures

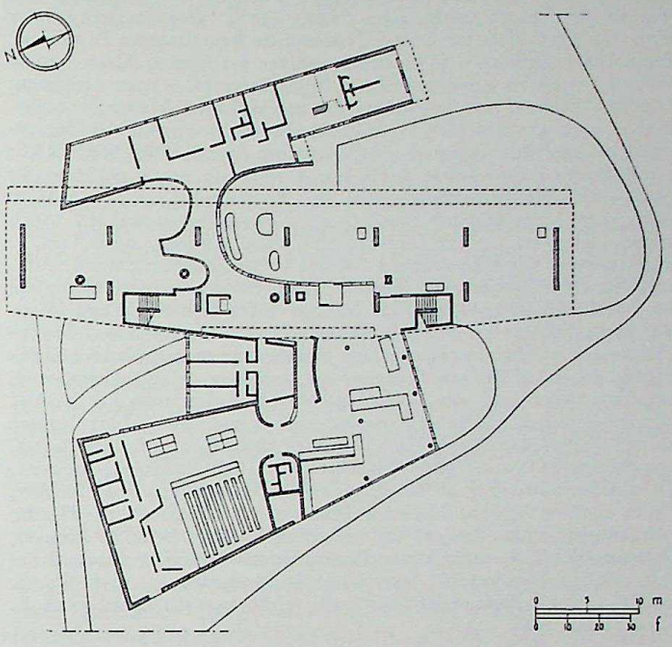
Eveux-sur-Arbresle, Dominican monastery of Ste-Marie de la Tourette, floor plan of the church (*from Casabella, no. 246, 1960*).

to correspond to the advances made in other industries. Finally, he created a new world of architectural forms by affirming, in opposition to the principles of historical and natural romanticism, the underlying geometry of structure and the preeminent role of mathematical proportion, both as a basis for theoretical study and as the effective means of creating architectural harmony.



Le Corbusier's radical rethinking of family dwellings and his innovations began with the Citrohan house (stilts, or *pilotis*; bands of windows and weightless screen walls; open, fluid plan; free façade; roof garden) and then the "Immeubles-Villas," which adapted similar structural elements to problems of communal living, and culminated in enormous housing blocks (*unité d'habitation*, Marseilles: PL. 107; I, PL. 388). These projects were meant to utilize in the optimum way the space allotted to each person in the crowded modern city, and the living unit was shaped to meet the functional demands of families within the industrialized civilization of the 1930s. Various buildings and projects mark the principal advances in his studies: in the 1920s, the Pavillon de l'Esprit Nouveau (Paris, Exposition des Arts Décoratifs), workers' housing for Pessac, and the houses of the Weissenhof quarter in Stuttgart (PL. 105; V, PL. 109); in the 1930s, the Clarté apartments and the Pavillon des Temps Nouveaux (Exposition Internationale). The reform of interior decoration and furniture that began in 1925, in collaboration with Charlotte Perriand and Pierre

Jeanneret, capped his efforts to promote spare and practical accessories for modern living.



In a parallel effort, Le Corbusier launched a vast inquiry into the urban problem, and by 1922 he had devised a theoretical solution from which his later plans derived. Contrary to Wright, who advocated diffusion of urban communities, Le Corbusier was opposed to horizontal spreading of the urban complex; at first sight, the principles he proposed for urban renovation might even seem contradictory — increased population density, improved methods of communication, and enlargement of green areas. This program could be implemented only by means of a radically new approach to the urban problem, involving innovations such as the "Cartesian skyscraper" (PL. 106); for residential areas, units of homes of a similar size; for the organization of traffic, the "7V" plan; and for industrial areas, the spacious landscaped "green factory." Classification by function extended to over-all zoning of the urban organism as well (*Les Trois Etablissements Humains*, 1944). Two projects exemplify these ideas: the plan for Saint-Dié (1945), which introduced a classic solution to the problem of the civic center, and the creation of Chandigarh (PL. 108; VII, FIG. 899), the new capital of Punjab, for which Le Corbusier laid out the general plan and constructed a monumental ensemble of exceptional importance.

Without industrialization and standardization of building techniques it would have been impossible to solve economically the social problem of producing lodgings *en masse*; nor would it have been possible to reinstate a genuine architectural discipline. The "Dom-ino" system of mass housing suggested as early as 1914 a principle of prefabricated construction that combined the advantages of standardization with the possibility of wide functional variation and esthetic satisfaction. Like Gropius, Le Corbusier saw as the most urgent task of modern architecture the definition of fundamental standards satisfying both the primordial needs of man and the demands of industrial production. His studies of such norms led to the concept of the "modulor," a scale of harmonic measures based on human stature. This system encouraged the ordering — that is, the unifying and humanizing — of basic forms in architecture and elsewhere in modern design.

The firm logic of the lyricism inherent in Le Corbusier's designs, set forth with a disciplined rhythm and proportion, escapes both the dryness of neoclassicism and dogmatic functionalism and the excesses of expressionism. The "correct and magnificent play of volumes in light" he postulated has been realized masterfully in his architecture. His manipulation of right angles and plane surfaces in the 1920s and 1930s is no less poetic than his use of sweeping curves and slanted surfaces in the 1950s at Ronchamp (I, PL. 381; IV, PL. 187). Although the free forms of the later works may appear highly irrational, they have a functional and acoustical logic (in his own words, *l'acoustique paysagiste*), as well founded as the austere functionalism of the early works. From 1925 to 1945, while his vocabulary of forms became more bold and varied, and gained a sculptural solidity, the spirit of his architectural aims remained unchanged. The "light-wall" of the Ronchamp chapel and the sections of undulant glass in the stark Dominican monastery of Ste-Marie de la Tourette are more lyrical realizations of the essentially functional *façade libre* (glass sections and *brises-soleil*, or sun shades) and of his preoccupation with ideal mathematical proportion.

Ronchamp, Notre-Dame-du-Haut, ground plan (*from Œuvre complète, Zurich, 1952–57*).

Paris, Cité Universitaire, Maison du Brésil, plan of the ground floor (in collaboration with L. Costa; *from Casabella, no. 248, 1961*).

The historical importance of Le Corbusier and the wide influence of his theories are universally acknowledged, though certain reactionary critics persist in denying the merits of his architecture in itself. Others who esteem most his cubist rationalism are disconcerted by Chandigarh and the Ronchamp chapel, which they prefer to view as lyric digressions from his fundamental principles. The housing units in Marseilles (PL. 107; I, PL. 388) revived the polemic incited in the 1930s by the Ville Radieuse, a scheme rejected by many urban planners and sociologists. For these critics Le Corbusier's response to mechanized civilization (enthusiasm according to some, distaste according to others) was purely subjective and thus without the value of critical method. The results, however, affirm the methodological worth of his ideas, which have proved a vital source for the innovations of 20th-century architecture.

PRINCIPAL WORKS. 1904–06: house at La Chaux-de-Fonds. – 1914–15: "Dom-ino" projects for prefabricated houses. – 1922–24: Paris, Ozenfant house; Auteil, double house for A. Jeanneret and La Roche; Boulogne-sur-Seine, double house for Lipchitz and Miestschaninoff. – 1925–26: Paris, Pavillon de l'Esprit Nouveau, displaying first "Voisin" plan for Paris; Pessac, workers' housing. – 1927: Stuttgart, two residences for Deutscher Werkbund exposition (PL. 105; V, PL. 109); villas at Garches (XI, PL. 354) and Carthage; project for League of Nations, Geneva. – 1929–33: Poissy, Savoye house (PL. 106; FIG. 191); Geneva, Clarté apartments; Moscow, Centrosoyus (completed 1935); first projects for the Ville Radieuse; Paris, Salvation Army hospice (Cité du Refuge; V, PL. 109; FIG. 191); Paris, Cité Universitaire, Swiss Hostel (PL. 106); project for "square spiral" museum with unlimited expansion capacity ("Musée à Croissance Illimitée"); project for Palace of the Soviets, Moscow; first city plan for Algiers; Boulogne-sur-Seine, apartment house; Macia plan for Barcelona; projects for apartment house and business center (Cité d'Affaires),

Algiers; Rentenanstalt project, Zurich; urban projects for Antwerp and Stockholm. – 1934–35: villa at Les Mathes; projects for the Algiers waterfront, Nemours (Algeria), and Barcelona; plans for a Ferme Radieuse and a cooperative village; project for workers' housing, Zurich. – 1936–37: consultant for Ministry of Education and Health, Rio de Janeiro (with L. Costa and O. Niemeyer; I, PL. 142); urban plan for Zlín, Czechoslovakia; projects for a museum of modern art (Paris), a university complex (Rio de Janeiro), and a housing unit for the Exposition Internationale of 1937 (Paris). – Paris, Pavillon des Temps Nouveaux; urban plan "Paris '37"; "Ilot Insalubre" city plan (no. 6); project for Centre National de Rejouissances Populaires for 100,000 persons. – 1938: urban scheme for Buenos Aires. – 1939: plans for a sports center and for refugee barracks. – 1940: armament factory ("Usine-verte"); designs for prefabricated Murondin buildings. – 1942–43: final plan for Algiers; studies concerning the employment of land and regional reorganization; founding of ASCORAL; publication of *La Charte d'Athènes*. – 1945–46: urban planning for Saint-Dié, Saint-Gaudens, and La Rochelle-Pallice. – 1946–47: Marseilles, large housing block (*unité d'habitation*; completed 1952); collaboration on project for seat of United Nations, New York. – 1948: project for subterranean basilica at Sainte-Baume; wood sculpture, in collaboration with the craftsman Savina. – 1950: city plans for Marseilles, Bogotá, and İzmir; studies for Ronchamp and Chandigarh; drawings for tapestries; publication of *Le Modulor*. – 1951–58: project for Quartier Rotterdam, Strasbourg; master plan for Chandigarh, capital of Punjab; Nantes-Rezé, apartment block; Ahmadabad, Shodhan house (PL. 107), Millowners' Association Building (I, PLS. 387, 424), and Museum of Knowledge (first realization of his "square spiral" plan); Chandigarh, High Courts of Justice (PL. 108); Ronchamp, completion of Notre-Dame-du-Haut (FIG. 193); Eveux-sur-Arbresle, Dominican monastery of Ste-Marie de la Tourette (FIG. 192); Neuilly, Jaoul houses; Tokyo, National Museum of Western Art; Meaux, five housing units; project for suburban housing (with J. Prouvé); Briey-en-Forêt, housing units; Berlin, Interbau housing block; Brussels, Philips Pavilion for International Exposition of 1958 (V, PL. 192, FIG. 291); Paris, Cité Universitaire, Maison du Brésil (with L. Costa; FIG. 194).

LEDOUX, CLAUDE NICOLAS. French architect (b. Dormans, Marne, 1736; d. Paris, Nov. 19, 1806.) From 1764 to 1789 Ledoux created buildings of a fresh style, impressive scale, and dramatic settings which appealed strongly to Parisian society (particularly Madame du Barry) and made his services, as one of France's foremost men of artistic genius, sought after by rulers in Germany and Russia. His early buildings reflect the doctrines of his teacher Jacques-François Blondel and the work of Ange-Jacques Gabriel (q.v.) at the Ministère de la Marine (cf. Ledoux's Hôtel Montmorency, Paris, 1765–70) and the Petit Trianon of Versailles (cf. Ledoux's series of small cube houses: Guimard, 1770; Louveciennes, 1771; St-Germain, 1772). In this sense Ledoux's style was similar to that of several contemporaries (J. Gondoin, J.-D. Antoine, F.-J. Bélanger), but his dramatic flair (illusionistic garden of Hôtel d'Hallwyl, Paris, 1764–67) and superior feeling for scale and unity of design (cf. Hôtel d'Hallwyl with Antoine's Hôtel de Fleury) makes his work distinctive even in this early period.

After 1775, however, Ledoux's designs became increasingly powerful and original, infused with a new spirit of fantasy which may be derived from his contemporary Etienne-Louis Boullée (particularly his Hôtel de Brunoy, 1772), but which only Ledoux was able to realize in major monuments. Ledoux's bolder style, appearing first in the buildings designed for the royal saltworks at Arc-et-Senans (1775–79), is exemplified by the differences remarked between his theater designs for Besançon and Marseilles (1775 and 1784, respectively) and between the above-mentioned early and the later cube houses (Jarnac, Espinchal, 1780; Saisseval, 1786). The richness of the new style is strikingly demonstrated in the 42 different designs produced for the tollhouses of Paris (1784–89; V, PL. 422), and its capacity for development is clear from a comparison of the Hôtel Thélusson (1780) with the Maisons Hosten (1787), both located in Paris. Further progress by Ledoux in developing this style was precluded by the Revolution, which enforced his permanent retirement from active practice.

With no commissions to stimulate and further shape his style, Ledoux spent the last seventeen years of his life creating an ideal and theoretical formulation of its principles, in the form of an ambitious publication entitled *L'Architecture considérée sous le rapport de l'Art, des Moeurs et de la Législation* (1804; a "second" volume published posthumously, 1847). In this literary effort, Ledoux idealized his past work both by changing the designs of his earlier buildings (pre-1775) to fit his new style and by embellishing and enlarging other

past commissions (Maupertuis?; I, PL. 308), particularly the buildings at Arc-et-Senans, which became the nucleus of an enormous ideal city called Chaux.

Although both the designs and text are a romantic statement of ideas better expressed in his buildings, it was this book which rescued Ledoux from the general disregard history had accorded his generation of architects. Ledoux's fantastic designs for workers' houses and factories were perceived anew in terms of a Bauhaus functionalism, and he was consequently acclaimed as the first "modern" architect, the initiator of ideas culminating in the work of Le Corbusier (E. Kaufmann, *Von Ledoux bis Le Corbusier*, Vienna, 1933). Although sustained at a popular level, this theory has been discarded by latter-day historians in their attempt to characterize more accurately, and thereby restore, Ledoux's true genius.

Bates LOWRY

LÉGER, FERNAND. French cubist and postcubist painter (b. Argentan, Normandy, Feb. 4, 1881; d. Gif-sur-Yvette, Seine-et-Oise, Aug. 17, 1955). In 1900 Léger moved to Paris, where he made his living as an architect's draftsman. After a year's military service in 1902–03, he studied informally in the studios of Léon Gérôme and Gabriel Ferrier and from 1906 to 1910 gave himself over almost entirely to painting. By 1911, having met the painters and writers of the cubist movement, Léger had defined his personal variant of cubism, made public the following year in a one-man exhibition at the Galerie Kahnweiler in Paris. Mobilized in 1914, he served as a stretcher-bearer until he was gassed and hospitalized for several months in 1917. His fame grew rapidly after the war with the development of his mature style, the mural-scale paintings incorporating machine motifs in a crisp, bas-relief manner of geometric clarity and strong color.

Léger's first major ventures outside the field of easel painting were his designs for the Swedish Ballet in 1921–22 and, in collaboration with Dudley Murphey, the famous film *Ballet mécanique* of 1923–24. Although Léger spent most of his life in Paris, he traveled widely and lived in the United States from 1940 to 1946. Soon after his death, his memorial and many major works were installed in the Musée Fernand Léger at Biot.

Léger was above all a painter of public scale, both in his social attitude and his broad decorative style. His special talents were recognized by Le Corbusier, for whom he did his first true murals in that architect's pavilion at the Exposition des Arts Décoratifs in Paris in 1925. After World War II he was given a number of major commissions, including mosaics for the façade of Notre-Dame in Assy (1949) and for the memorial at Bastogne (1950), stained glass for the Church of Sacré-Cœur in Audincourt (1951) and a church in Courfaivre, Switzerland (1954), and murals for the United Nations General Assembly auditorium (1952).

In spite of activity in other media, especially painted ceramics, Léger's reputation was established by his large oil paintings, among them *The Card Players* (1917; Otterlo, Rijksmus. Kröller-Müller), *The City* (1919; Philadelphia, Mus. of Art); *Three Women* (*Le Grand Déjeuner*; 1921; New York, Mus. of Mod. Art), *Divers on Yellow Background* (1941; Chicago, Art Inst.), *Leisure* (1944–49; Paris, Mus. d'Art Mod.), and *The Great Parade* (1954; New York, Guggenheim Mus.). One of the rare artists receptive to and genuinely inspired by popular taste, Léger embodied in his art both the iconography and the expression of modern urban and technological culture. Figures and abstract objects of his own creation float in the shallow spaces of what he called his "animated landscapes." The individual forms, planar and metallic in their modeling — he was heir to David and Ingres in this aspect of his work — and the intense primary colors produce a visual cacophony suggesting the dynamic qualities of the machine age (V, PL. 124).

Robert L. HERBERT

LEHMBRUCK, WILHELM. German sculptor (b. Meiderich, near Duisburg, Jan. 4, 1881; d. Mar. 25, 1919). Wilhelm Lehmbruck was the fourth of eight children born to a Rhineland miner. His artistic training began at the Kunstgewerbeschule in Düsseldorf (1895–99). From 1901 to 1907 he was an assistant in sculpture at the Düsseldorf Kunstakademie. A handsome, sensitive youth, his aristocratic bearing and dress belied his modest background. Successful from the beginning, he received numerous awards and, in 1905, won a first prize for sculpture, after which he traveled in Italy. In 1907 he sent several works to the Salon of the Société Nationale des Beaux-Arts in Paris and in 1910, with his young wife, went to Paris to live. Except for another trip to Italy in 1912, he remained in Paris until the outbreak of World War I, when he moved to Berlin.

His early work was in the academic tradition, but by 1905 he had come under the influence of Rodin, especially in his choice of subject matter and pose and in his treatment of surface. *The Bather* (1905; Düsseldorf, Kunstakademie) is a naturalistically modeled nude bending to touch her leg. To capture the fleeting gesture and convey varied emotions, he posed his figures unconventionally — bending, standing with one foot raised, kneeling, and even crawling. Lehmbruck's characteristic qualities began to appear in these early years, particularly his capacity for evoking mood and a sense of anxiety. *Mother and Child* (1907; Essen, Folkwang Mus.) depicts a crouching nude gazing with loving fondness at the infant on her lap. Emotion bordering on the sentimental is expressed in *Sorrowing Woman* (1909; Duisburg, Städt. Kunstmus. und Lehmbruck-Samml.) and *Memories* (1909; Essen, Folkwang Mus.). The life-size figure *Mankind* (1909) is reminiscent of a Michelangelo *Slave*. In Paris Lehmbruck became acquainted with and admired the classicism of Maillol. The *Standing Woman* of 1910 (New York, Mus. of Mod. Art), one of his most important works, is posed in the manner of the *Venus de Milo*, with inflected hips and draped thighs. The body is classically smooth and rounded, but the treatment of the head is delicately impressionistic, with soft curls and lowered eyelids. Although in a transitional style, this work marks Lehmbruck, at the age of 29, as a major sculptor. It was followed by the *Frau Lehmbruck* (1910; Stuttgart, Coll. Frau A. Lehmbruck), a bust in which his former classical restraint begins to be modified: in the torso, by subtle enlargement of the throat and breasts; in the head, by emphasis upon the prominent forehead, the deep-set eyes, and a moody, introspective expression. This portrait of his beautiful wife, at about the time of her first pregnancy (she bore Lehmbruck two sons, one of whom, Manfred, was to design a museum at Duisburg for his father's works), reveals the sculptor's strong attachment to his family, as do numerous drawings and two sculptures of infants (1910).

At this point in his career Lehmbruck's mature style began to emerge rapidly. The sentiment of the late German Gothic was part of his Rhenish heritage; moreover, he was influenced by the Art Nouveau sculpture of George Minne, and his drawings are suggestive of the winding, moodily expressive linear patterns of Munch. From such disparate influences, including the work of Rodin and Maillol, this hypersensitive and inner-oriented young sculptor produced a masterpiece in the over-life-size *Kneeling Woman* (1911; New York, Mus. of Mod. Art). An extremely tall figure, with gracefully posed arms, long neck,

and bent head, the body retains the classical form of the *Standing Woman*, although here the proportions are gently attenuated. The bemused countenance inspires in the spectator a feeling of melancholy. Among many fine sculptures of the productive period that followed, perhaps the finest is the *Standing Youth* (1913; New York, Mus. of Mod. Art), a thin giant whose crossed arms, raised leg, and enigmatic frown invest him with great power. In Berlin during the war, Lehmbruck produced the tragic monument *The Fallen* (1915–16; Coll. Frau A. Lehmbruck), the figure of a crouching war hero whose lowered head touches the ground. The *Seated Youth* (1918; Düsseldorf, Kunstakademie), formerly a public monument and his last major work, is on a related theme. Deeply troubled in the aftermath of the war, and in poor health, Lehmbruck took his own life on Mar. 25, 1919. In addition to his sculpture, he left a large number of drawings and etchings.

Henry R. HOPE

LELY, PETER. English painter (b. Soest, Westphalia, Oct. 14, 1618; d. London, Dec. 7, 1680). Lely was trained in Haarlem under Pieter Fransz. de Grebber, became a master in the Haarlem Guild of St. Luke (1637), and afterward went to England (1641 or 1643), where by the 1650s he had established the most extensive practice of any English portrait painter. Following the Restoration (1660), Lely became the first painter since Van Dyck to attain a position of social eminence, upon his appointment as principal court painter by Charles II; he was subsequently pensioned and knighted. By 1670 he was directing a large studio, in which the young Nicolas de Largillière worked as his assistant. The first painter in England whose work survives in great quantities, Lely was also one of the first nonprincely collectors of paintings and drawings. His collection, begun during the Commonwealth, was sold after his death at the first spectacular picture auction in the Western world.

Although nothing is known of Lely's earliest subjects, those painted in England were landscapes and historical pieces; his first portraits, such as the *Blind Harper* (Northamptonshire, Althorp, Coll. Earl Spencer), were influenced by William Dobson and Isaac Fuller. During the Commonwealth he painted what might be called "subject pieces," but after the Restoration confined himself to portraiture. Patronage by the Earl of Northumberland in the 1640s may have given Lely the opportunity to study the Earl's Van Dyck collection; Van Dyck's influence is marked, for instance, in *The Younger Children of Charles I* (1647; Sussex, Petworth House), embodying the "portrait in a landscape" motif that was to dominate English painting through the 18th century. In contrast to the Van Dyck style was Lely's "classical" pictorial manner (later taken up by Reynolds), initiated in his *Henry Sidney, later Earl of Romney* (1650–55; Kent, Penshurst Place, Coll. Viscount De L'Isle) — "classical" solely because of its introduction of antique attributes.

In the 1650s Lely produced a series of portraits in his so-called "austere Commonwealth style," characterized by subjects of somewhat gloomy countenance, often complemented by a large, decorative sculptural piece. During this period he began — at least in his female portraits — to generalize and flatter the sitter. At the same time he developed the group composition, which became a fixed tradition in English portrait painting. With the 1660s and the Restoration Lely evolved a new style, sustained for the rest of his career; its voluptuous and languorous tone, reflecting the fashionable court life of the period, was imparted with ever-refined and subtle technique and a formal catalogue of poses (which, in fact, he eventually numbered). The late portrait series such as the "Windsor Beauties" (1660s; Middlesex, Hampton Court Palace, Royal Colls.) and the "Admirals" (1666–67; Greenwich, London, Nat. Maritime Mus.) display loose, free brushwork, transparent color overlays, emphasis on chiaroscuro and decorative effects, and high color. Throughout his work Lely's style was decidedly international, rather than personal or English, and some of his portraits are indistinguishable from work done on the Continent about this time. Although technically proficient, he cannot be judged a truly creative artist; however, his businesslike approach toward his art established the cast of the successful portrait painter in England until the romantic period.

REPRESENTATIVE WORKS. *Charles I and James, Duke of York*, 1647, Middlesex, Syon House, Coll. Duke of Northumberland. – *Lady Dering*, 1651, Sussex, Parham Park, Coll. Hon. Clive Pearson. – *Sir William Compton*, ca. 1651, Surrey, Ham House. – *The Duet*, 1654, Gloucestershire, Batsford Park, Coll. Lord Dulverton. – *Europa and the Bull*, ca. 1655, Derbyshire, Trustees of the Chatsworth Settlement. – *Nymphs at a Fountain*, ca. 1655, London, Dulwich College Picture Gallery. – *The Perryer Family*, 1655, Kent, Chequers Court. – *The Family of Charles Dormer, Earl of Carnarvon*, ca. 1658–59, London, Coll. Sir John Coote. – *The Family of Sir John Cotton, Bart.*, 1660, Oxford, Brewis Coll. – *Elizabeth, Countess of Northumberland*, 1660s, Middlesex, Hampton Court Palace, Royal Colls. – *Admiral Sir Jeremy Smith*, 1666–67, Greenwich, London, Nat. Maritime Mus. – *Sir John Harman*, 1666–67 (VI, PL. 438).

* *

LE NAIN, ANTOINE (1588–1648), **LOUIS** (1593–1648), **MATHIEU** (1607–77). Family of painters, born at Laon-en-Vermandois (Picardy), between Paris and Flanders. The sons of a *sergent royal*, "they were trained by a foreign painter . . . at Laon . . . for a year. From there, they went to Paris where they perfected their art, and established themselves . . . living in the same house . . . in a perfect union" (Claude L'Eleu, *Histoire de Laon*, 1711–23, ms. in Laon library; cf. Valabrègue, 1904, pp. 9–11). P. J. Mariette noted that the brothers Le Nain "were so similar in their work that it was practically impossible to distinguish what each had done on a particular painting, inasmuch as they all worked together" (*Abecedario . . .*, ed. P. de Chennevières and A. de Montaiglon, Paris, 1851–60). An idea of the appearance of their studio is conveyed in a painting, *The Studio* (ca. 1630; London, Coll. Marquess of Bute; also, drawing in Leningrad, The Hermitage). The painter represented appears to be Mathieu; the model, Louis; the seated man, Antoine; and the portrait of an old man, that of their father. The attribution of this painting to Antoine is uncertain.

There are neither many nor particularly significant dates for a biography of the Le Nain brothers. In 1629 Antoine was a master painter at Saint-Germain-des-Près, then a suburb of Paris; in 1630 he was again cited as "maître," his brothers being mentioned as fellow painters; L'Eleu gives 1632 as the year in which they began to achieve wider repute; and in 1633 Mathieu was a master painter of the city of Paris and a lieutenant in the city militia. In 1646, the three men agreed to leave all their property to the last to survive. In March, 1648, the newly founded Royal Academy of Painting and Sculpture received the brothers as academicians of the second class; Louis and Antoine were mentioned as "peintres de bambochades." But in May both Louis, 55, and Antoine, 60, died. In the following year, Mathieu was mentioned as a portraitist when he was twice noted as in arrears with his dues for the Academy. L'Eleu mentions that in 1662 Mathieu corresponded with other artists of the Academy, but in 1663 he no longer appeared on the list of the members. In 1667 Mathieu was referred to as the owner of La Jumelle, a small farm he had inherited. In 1668 he willed his substantial property to a nephew, but he later annulled this bequest. Chevalier of the Order of St. Michael, "Peintre du Roi," and member of the Academy, Mathieu Le Nain died in 1677 at the age of seventy. The inventory

of his house revealed an austere interior with many pictures, both finished and incomplete, predominantly on religious themes.

The Le Nains pose a complex problem for art historians. Definition of three separate but intimately related artistic personalities is understandably difficult. Their life spans, ranging from 1588 to 1677, comprehend a century of rapid evolution in painting, and the problem is therefore complicated further. The attribution of works is also extremely involved, for their activity encompassed both works painted by a single brother and close collaborations.

Moreover, the early critics are divided in their opinion. Mariette said "they painted *bamboches* in the French style. They had beautiful brush technique and were able to blend their colors artfully and to produce paintings that were as pleasing by their technique as by the naïveté of the characters which they introduced." On the other hand, André Félibien considered them portraitists and historical painters, "but in a manner with little nobility, frequently representing simple subjects without beauty . . . subjects of common and often ridiculous activities" (*Entretiens sur les vies et les ouvrages des plus excellens peintres* . . . , London, new ed., 1705, pp. 170–71). Finally, for L'Eleu, the Le Nains "had different personalities. Antoine excelled in miniatures and in portraits *en raccourcis*. Louis, the younger brother, was successful with half-length and bust portraits. Mathieu . . . was for the grand tableaux, such as those representing religious mysteries, the martyrdom of saints, battles, and the like." In addition to problems arising from the discordant early criticism, there are others created by the disappearance of many works, some fully documented. There are known only 15 paintings dated and signed "Le Nain"; none is signed with a first name. Certain of the signatures are disputed, and some of the dates are incomplete or doubtful. Ten works dated between 1641 and 1648, which must be variously assigned among the brothers, are the reference points about which the obscure artistic activities of this family must be reconstructed.

The influence of the foreign painter in Laon (who was not necessarily Flemish, but perhaps Italianate in his art) mentioned by L'Eleu should not be exaggerated. Nor should it even be assumed that he was any more influential over Antoine because he was the eldest brother. This early tutelage in Laon was less important to the formation of the style of the Le Nains than was the period of their studies in Paris, before and after 1629. Saint-Germain-des-Près was the center of a colony of artists, in part Dutch and Flemish, including numerous engravers, whose work presented varied influences. These realistic engravers copied or interpreted works by Villamena, Valentin, Callot, Rembrandt, Both, Vorsterman, and Adriaen van Ostade, in somewhat awkward fashion but with much freedom and animation. This style can also be seen in the compositions of Hulpeau, which were more expressive than those of the Le Nains, and in the work of Jacques Lagniet (later, ca. 1660), who was more vulgar. Abraham Bosse was closer to the Le Nain brothers by reason of his careful attention to composition and execution, his honest realism, and his bourgeois sobriety. Like their contemporary Baugin, who painted both still lifes and larger religious works, the Le Nains painted subjects of various types. Their portraits, such as the signed likeness of a noblewoman — perhaps the Marquise de Forbin — in Avignon (1644?; Mus. Calvet; copy?), have a frankness of characterization that brings to mind the contemporaneous, but more Flemish, Philippe de Champaigne. There are also similarities with the provincial art of Richard Tassel of Langres, whose *Cathérine de Montholon* (Dijon, Mus. B.A.) is, however, a more incisive portrait than the Le Nain in the Musée Calvet.

The influence of the Netherlands on the environment of the Le Nains is illustrated by certain works of, for example, Sébastien Bourdon, who painted genre scenes in Flemish style, and of the pseudo-De Vlieger, who was surely French. The relationship of Spanish art, despite some arguable similarities to Velázquez, cannot be established; and similarly, the Italian: one of the brothers — Louis according to P. Jamot (1929), Mathieu to Thuillier (1958) — was nicknamed "le Romain," but, as for all French art of the period, the problem of Italian influence remains equally unresolved.

The personality of Antoine is connected with the art of the Netherlands; Blunt (1954) cites the influence of A. Pietersz. van de Venne and Hendrick Avercamp. G. Isarlo (1938) dates *The Supper at Emmaus* (Louvre) and *The Studio* (London, Coll. Marquess of Bute) in the Laon period. The decade 1630–40 (with patent influence from Brouwer, Van Craesbeeck, and Hals) has been cited by Isarlo as the period of the small paintings of children on wood or copper, *The Grace* (*Bénédicité*; Paris, Coll. David-Weill), some group scenes (London, Nat. Gall.; Lugano, Thyssen-Bornemisza Coll.), the *Family Gathering* (PL. 112), and the *Portraits in an Interior*, both in the Louvre (Isarlo does not accept the dates 1642 and 1647 for the last two). In these pictures the perspective is unconvincing. The figures of a group, bunched before a neutral ground in one or two rows, face the viewer directly or assume degrees of profile that create a slight illusion of depth. They are individually stiff, often awkwardly seated; the hands are too small; the rough-hewn faces are too large in proportion to the bodies; and the eyes are set too far from the noses. All the figures, whether peasants or townspeople, are posed as if sitting for portraits, even when the scene represents a concert, a dance, or a meal. These group studies often include authentic portraits, ingenuous and good-humored, but at times they approach caricature. The manner is miniaturist, though it is varied by broad accents. The color scale, predominately in gradations of brown, also includes pinks, lively reds, and white.

After 1640 (under the influence of Teniers, according to Isarlo) the lighting in Antoine's works is rendered with greater contrast. The draperies are frequently more ample and arranged with more elegant folds, as in the cape of *The Flageolet Player* (London, Vict. and Alb.) or the sumptuous materials of the costumes in *The Young Musicians* (London, Coll. Lord Aldenham). Antoine was impelled toward a new style by his brothers, who may have collaborated in some of his works. As he grew more audacious, he increased the size of his paintings. Yet the large full-length portrait of the Marquis de Troisvilles (1644; Rueil, Seine-et-Oise, Coll. Comtesse de Montréal), in the manner of Frans Pourbus the Younger, is still minutely executed and lacks vitality. Essentially, Antoine must be considered an artist in the old style, *petit-bourgeois* in taste, and of limited range.

Louis Le Nain, in the opinion of Isarlo, was certainly influenced by Pieter Aertsen, Bruegel, and Bassano in the Laon period and later, in Italy, by Caravaggesque and Bassanesque painters. Blunt has indicated possible contact with Pieter van Laer, in Paris (ca. 1626) or in Italy (between 1626 and 1630?), and with Italians who had worked in Paris, such as O. Gentileschi (1626). Certain Italianate works available to Louis in Paris, for example those of Valentin, have also been suggested as an influence.

The genius of Louis is attested by the solidity, sincerity, and warmth of his works, such as the 1644 portrait in Avignon, mentioned above, the *Young Men* in Brussels, and especially the genre scenes, so different from the typical anecdotal pictures of the period.

The paintings from 1630 to 1640, of medium size and representing religious subjects (*The Supper at Emmaus* and *The Last Supper* in the Louvre), reveal an Italian influence in the strong lighting, the movement, the studio models, and in details taken from the antique such as sandals and amphoras. *The Forge* (Louvre) is a night scene with a slight suggestion of Bassano; the pale flames of the hearth set the tone of the picture against a deep background, with a play of rose, blond tints, browns, blues, and greenish tones. All the figures are relaxed and waiting. The execution is fluid, with visible retouching and erasures as if the painting were an improvisation.

The Cart of 1641 (PL. 111) is kind of pendant to *The Forge*: the dimensions are similar, and the possibilities of color and lighting are again investigated. Here, however, the scene is outdoors, with a wan sunlight in humid atmosphere picking out light reflections in the shadow of the shed. The color harmonies range from blond to gray, red, or pink. The execution,

vigorous in the foreground, is modulated into bare suggestions of form in other areas. Treated in a style reminiscent of miniatures, this is one of the first French landscapes; its poetry foreshadows that of Corot. The clusters of figures are ably disposed around a central void, and the girl with the brass caldron anticipates the mood of Chardin. Other larger and later paintings are connected with *The Cart: Peasants in front of a House* (Boston, Mus. of Fine Arts), *The Resting Chevalier* (London, Vict. and Alb.), *The Dairywoman's Family* (Leningrad, The Hermitage; PL. 109) with its monumental figures, and the small painting in the same genre, the *Peasants in a Landscape* (Hartford, Wadsworth Atheneum).

About 1640 Louis painted large interior scenes such as *The Peasant Supper* (Louvre; II, PL. 182), almost a monochrome with a reddish tonality relieved by touches of blue, a puzzle pattern of spots and crisp details. In the background a child is silhouetted against the fire on the hearth; another, a little girl, is outlined in pink, her face catching the light of the fire under the shadow of her cap. The other figures, lighted from a side source, are posed on several planes facing outward. Similar lighting effects may be seen in the *Venus in Vulcan's Forge* and other works.

The Peasant Family (1642?; Louvre) is more ample and studied. The brownish tone is picked up with grays and pinks. The execution is more careful, at times drier, than in other scenes of the kind, and the lighting is more evenly distributed. There is no uniformity in the furnishings, which include crude chairs along with a fine bed in the background, nor in the social standing of the various figures placed irregularly around the table. The meal proceeds with a religious solemnity, as noted by the 19th-century critic Théophile Thoré-Burger, and the central figure, with his gaunt, dedicated face, seems to be conducting a sacred rite. In other family groups the content is less grave, for example, *The Visit to Grandmother* (Leningrad, The Hermitage; PL. 109) and *The Return from a Baptism* (1642?; Louvre).

Some works on which Louis was assisted by his brothers can be dated sometime after 1640. *The Bird Catchers* (lost; copy in Leningrad) may be one such painting or it may be largely by Mathieu, who must have had to finish the works of his older brothers, make copies of them, or execute compositions in their style. Typical instances of these inextricable collaborations are two large paintings conceived as pendants, which, though of Flemish inspiration, are of a French stiffness and boldness of style. Against a gray-blue sky and a low-lying chalky landscape, the procession of the ram (Philadelphia, Mus. of Art) and that of the wine or of the fattened calf (Paris, Gall. Simon) advance; the figures are arranged as if in a frieze: bourgeois, peasants, lively children, a violinist, a blind hurdy-gurdy player. The first and the better of the two paintings, with a fine landscape and silvery color harmonies, is by Louis and Mathieu; the second and later is harder, more cursory in execution and garish in color; it is by Mathieu. The *Bacchus and Ariadne* (Paris, private coll.), recently discovered, is almost certainly by Louis. Both Louis and Mathieu worked on the *Venus in Vulcan's Forge* of 1641 (PL. 114); the luminosity is Louis's; the varied and vigorous tonality is Mathieu's; and certain seminude figures showing the influence of Simon Vouet constitute a new direction, probably on the part of Mathieu. The same tendencies occur in *The Birth of the Virgin* (Paris, St-Etienne-du-Mont), in which Isarlo distinguished elements from all three brothers, and in *The Nativity* (Louvre), by Louis and Mathieu. Other recently found works are akin to the preceding two: a *Visitation* (Saint-Denis-de-Piles, near Libourne, Gironde) a *Presentation of the Virgin* (Limon, Seine-et-Oise, St-Louis-du-Temple) and a rather saccharine *St. Michael* (Nevers, St-Pierre), perhaps also collaborative works. Certain details are beautiful, but there are other parts that are heavy-handed.

For certain scholars (e.g., Thuillier, 1958) the painter of religious and historical subjects was Mathieu, not Louis. Mathieu Le Nain was the most eclectic of the brothers, the one most open to new ideas. Even before 1640 he was noted for his portraits, and the later (1646?) *Portrait of a Young Man* in the style of Van Dyck (Laon, Mus. Municipal) is an example of his work in this genre. In this period he also executed religious works, not yet in the Caravaggesque manner of *The Nativity* (New York, George Farkas Coll.), but on the order of *The Virgin and Child with St. Anne and Angels* (Rennes, Mus. B.A.), the ashen tonalities of which recall the school of Utrecht. About 1640 his personality reveals a marked sensitivity to baroque and classic traditions in painting, perhaps indicating a visit to Italy. At the same time, his work shows points of contact with Dutch genre painters such as Palamedesz, Metsu, and the Italianate Dutch artists of the court.

A Tavern Quarrel (Highnam Court, Gloucester, England, Gambier-Parry Coll.), the *Peasants' Meal* (PL. 113), and the *Young Gamblers* (Louvre; London, Royal Colls.) are rustic scenes in the style of Louis but with a baroque animation conveyed by facial expressions and bold lighting effects. In the bourgeois genre, *Le Corps de Garde* (1643?; Paris, Coll. Baroness de Berckheim) is a striking virtuoso piece (for example, the carpet), close-knit in detail and sustained in color. This work is not coherent throughout but is notable for its complicated sources of illumination: the flame in the background, the candlelight that recalls Honthorst's work, the Negro servant lighted from below, eyes gleaming in the shadow. The *Family Reunion* (Louvre), once attributed to a Dutch painter, is less intense but minutely detailed under a cold light.

After 1648 Mathieu continued in this genre with *The Backgammon Players* (PL. 110), a more emphatic work, in which the forms are modeled with black shadows, and the strong red of a cape is played against more muted tones. *The Dice Throwers* (Amsterdam, Rijksmus.), the *Youths at a Meal* (Magdeburg), and *The Family Dinner* (Toledo, Ohio, Mus. of Art) are in a similar style. In *The Dancing Lesson* (Paris, Coll. Bérard) and the *Farandole* (U.S.A., private coll.) a certain negligence in execution is compensated by the harmony of grays, pinks, and blond tints and the graceful garlands. *The Dancing Lesson* and other works of Mathieu were, in the 18th century, grouped with other paintings, including *The Piper* and *The Vintage*; these two, however, are not by Mathieu but later imitators. These superficial *bambochades* may be said to "anticipate" the 18th century, in much the same way as the work of Jean Michelin, a mediocre disciple of the Le Nains, and the somewhat younger Pierre Montallier.

By about 1660 Mathieu was following the fashion that preferred historical subjects to contemporary realism, as L'Eleu's inventory affirms. A *Nativity* (Le Bourget, Coll. Mary), formerly thought to be dated 1674 and therefore attributed to him, is now moved back to 1644, thus posing the possibility of a collaboration. A recently discovered *Entombment*, for a time attributed to Louis alone, may also be a collaboration. After 1648 religious themes recur in Mathieu's painting but with less successful effect.

The work of the Le Nain brothers must be considered within the framework of French painting from Fouquet to our time and in the light of the trends carried on by Chardin, Corot, Courbet, and Cézanne. Champfleury saw in the brothers' compositions "the austerity of Poussin"; they aspired to classicism both instinctively and in response to Italian influence, the classical ideal being more that of the bourgeoisie than of the court. They were realists both in the manner of the Dutch artists and of the French "little" masters. Their bent for improvisation resulted not only in certain faults in their works, but also in productive discoveries and a striking spontaneity. They set themselves problems, seeking better composition and rendering of light with effective gray harmonies. Louis, with his light effects, his beautiful landscapes, and his cameo faces, was the most gifted, but Mathieu, with his vigor and his clear or pearly colors, is not far inferior. Their figures vary from the ridiculous, to the monumental, to the highly animated (in the last works). The expressions — pensive, sweetly or sadly smiling — carry conviction. In the French art devoted to children the Le Nains created an appealing type. Their children, whether bourgeois or peasant, are grave, attentive, or dreamy, bringing a poetic note to the scenes of everyday life. The Le Nains conceived of the French family as a circumscribed group in

which each individual, though isolated, may suggest, by a gesture or a glance, the affection that unites them all. These families clearly belong to well-defined social classes, and from servant to master each person is differentiated by dress. Although the Le Nains certainly were aware of the terrible poverty of the peasants, they preferred to paint them with an air of good health, occasionally prosperous and never extremely poor. Their scenes are inspired not by reality but by an ideal conception of peasant life. On the other hand, when they painted the bourgeoisie, they were more precise, for the subjects are actual or seeming portraits. Antoine's *petits bourgeois* contrast with those by Mathieu — aware of their power, cultivated, and at their ease. The abrupt disappearance of this art of the bourgeoisie occurred when all France was dazzled by the splendor of the court. The Le Nains liked to combine peasants and bourgeoisie in harmony, not as opposed groups but as two aspects of the Third Estate. The figures in these paintings are relaxed in body and soul, now and then to the point of lassitude, but heavy fatigue, laughter, and wild joy are absent. The poetry of the Le Nains lies in the expression of prudence, dignity, seriousness, good will, and harmony.

About 1850 the reputation of the Le Nains soared. Previously, since the 18th century, they had been considered in the category of the Dutch minor masters. Then, quite suddenly, for social and political rather than artistic reasons, there was a complete reevaluation. Champfleury particularly, who was also a native of Laon, took an interest in these forgotten provincial painters, declaring them the champions of a democratic and social realism (1862). On the basis of newly discovered documents, among which were those of Claude L'Eleu, a canon of Laon in the 18th century, Champfleury compiled the first catalogue of their works (1861). In 1904 appeared Valabrègue's monograph, carrying on Champfleury's theories. In 1910 Robert Witt organized an exhibition at the Burlington Fine Arts Club in London and collected indispensable documentary material, now at the Courtauld Institute. In his fundamental work of 1929 P. Jamot emphasized the poetry and the benevolence of the brothers Le Nain, provided a new criterion of judgment, and essayed the difficult task of separating their personalities. This task was continued by P. Fierens (1933), while W. Weisbach (1932) clarified their position in the history of French painting. The Paris "Peintres de la réalité" exhibition (1934) confirmed their significance. The Reims Le Nain exhibition (1953) revealed the insecurity of many attributions, and recent critics, particularly G. Isarlo, have tried to elucidate some of the problems presented by the brothers' collaboration and by the various influences on their art. Wildenstein published (in 1955) the inventory compiled after the death of Mathieu. Investigation of the legal archives is bit by bit expanding and clarifying knowledge of the brothers' *œuvre*.

LE NÔTRE (LE NOSTRE), ANDRÉ. French landscape architect and gardener (b. Paris, Mar. 12, 1613; d. Sept. 15, 1700). Son of Jean Le Nôtre, "jardinier en chef" to Louis XIII, and grandson of Pierre Le Nôtre, also a royal master gardener, André Le Nôtre's style developed logically from a complex of influences: his family background, the classic tradition, French rational thought, and the canons of gardening established earlier in the century by the landscape architects and theorists Claude Mollet and Jacques Boyceau. Under the tutelage of the painter Simon Vouet (q.v.), to whom he was apprenticed at the age of thirteen, and from the writings of Salomon de Caus, Le Nôtre learned the laws of perspective and optical foreshortening. This knowledge and his study of the academic architecture of his day both served him well in the composition of his geometric, architecturally conceived garden schemes.

Although he succeeded his father as "jardinier en chef des Tuileries" in 1637, it was not until about 1655 that Le Nôtre's significant place in the history of architecture was finally assured, for it was then he began to design the gardens of Nicolas Fouquet's Vaux-le-Vicomte. At Vaux the direction that 17th-century landscape architecture was ultimately to follow became clearly defined: in the geometric formality of the axial composition, in the careful proportioning of the many and diverse parts, and in the perfect equilibrium and subtle relationship of sculpture, fountains, parterres, and architectural elements. The garden becomes a logical architectural extension of the château and, at the same time, a pleasing, carefully ordered frame for it. Optical foreshortening and the many subtle changes in level contribute the significant element of "surprise," providing relief from what might otherwise be too rigorous a geometry. Already in the water parterres at Vaux, which were treated like luminous mirrors in accord with theories of light propounded by Descartes (*La Dioptrique*), yet another aspect of Le Nôtre's definitive formula was established.

In the grandiose plan for Versailles (II, FIG. 299), begun in 1662, the Le Nôtre principles of garden design attained full realization. The imposing scale and visual splendor provided the ideal backdrop for the elaborate fetes of the court of Louis XIV. At Versailles, marked by numerous vistas opening to infinity, the landscape designer further refined his manipulation of optical illusion, the balance of parts, and his use of planes of water (canals, pools, basins) as sources of luminosity. Within the wooded areas bordering the axially conceived avenues, a myriad of surprises awaited the spectator in the form of topiary and architectural chambers, with jetting fountains, intriguing in their seemingly endless variety (VIII, PLS. 437, 438).

During Le Nôtre's long life, his creative genius was manifest not only in extensive royal parks throughout France but also in more intimate gardens both at home and abroad. Soon after the park at Versailles was begun, he was commissioned to design the gardens at Chantilly, and later those at Clagny, Sceaux, and the Grand Trianon (V, FIG. 674). He was equally facile in adapting and modifying existing garden sites, to which his landscape renderings for Saint-Germain-en-Laye, Meudon, Fontainebleau, Saint-Cloud, and the Tuileries all attest. As Le Nôtre's fame spread, his counsel was sought by the sovereigns of Europe, among them Charles II of England and the rulers of the Low Countries, Denmark, and Sweden.

The gardens he designed proclaim Le Nôtre's ingenuity and skill, but it remained for his collaborators and pupils to record his theories of landscape design. As his epitaph states, Le Nôtre "invented significant beauties and carried all others to their utmost perfection." (See also LANDSCAPE ARCHITECTURE.)

Hamilton HAZLEHURST

LEONARDO DA VINCI. Illegitimate son of the Florentine notary Ser Piero da Vinci, Leonardo was born Apr. 15, 1452, in Vinci, near Empoli; he died May 2, 1519, at Cloux near Amboise. At the age of fifteen he was taken by his father to Florence, to the studio of Andrea del Verrocchio. There Leonardo received a broad training, which included painting, sculpture, and the technical aspects of art. He also frequented the neighboring atelier of the Pollaiuolo brothers, where he became

especially interested in anatomy. In 1472 he was accepted as a member of the Florentine painters' guild; he remained, however, an additional four years in the workshop of Verrocchio. Leonardo's early works were produced in this period of collaboration with his teacher and included one of the angels and the landscape background in Verrocchio's *Baptism of Christ* (Florence, Uffizi), two paintings of the Annunciation (Florence, Uffizi, PL. 116; Paris, Louvre), and a *Virgin and Child* (Munich, Alte Pin.). About 1478 Leonardo became an independent master, remaining for another five years in Florence. From this period of activity stem the so-called "Portrait of Ginevra Benci" (Vaduz, Liechtenstein Coll.), the unfinished *St. Jerome* (PL. 115), and the large incomplete panel with *The Adoration of the Magi* (PL. 117; IV, PL. 266); the panel was commissioned by the Monastery of S. Donato a Scopeto but remained unfinished when Leonardo left Florence in 1481 to enter into the service of Lodovico Sforza, duke of Milan.

A petition written by Leonardo (1481–82), which resulted in his call to the court of the Sforzas in Milan, is the earliest indication of the artist's many-sided interests and skills. Preserved now only in outline among Leonardo's manuscripts, the petition presented his qualifications in ten points. Nine of these dealt with his competence as a civil and military engineer, and only the tenth expressed his capacity as a painter. Leonardo was employed as court painter and engineer in Milan for nearly twenty years. During that time he completed the first version of *The Virgin of the Rocks* (Louvre; PL. 121), begun in 1483; a second version (London, Nat. Gall.; PL. 120), begun about 1497 and completed in 1511; *The Last Supper*, painted between 1495 and 1497 for the Convent of S. Maria delle Grazie in Milan (PL. 125); the portrait of Cecilia Gallerani (PL. 124); and *Portrait of a Musician* (Milan, Ambrosiana). Other works from this period have disappeared.

An important reason for the artist's call to Milan was the commission for a monumental bronze equestrian statue of Francesco Sforza, the first duke, which occupied Leonardo for a number of years. The full-size clay model of the horse, now lost, was executed and then displayed in 1493, but the work was never cast, because the bronze intended for this purpose was needed for casting cannons in the war against the French. The defeat of Duke Lodovico sealed the fate of the projected monument of his ancestor.

Leonardo's architectural projects from the Milanese period are known only through documents and drawings. He executed a model for the dome of the Cathedral of Milan (1487–90), made plans for a palace, and supervised the construction of the new cathedral of Pavia. Leonardo's advice was solicited in the construction of fortifications. Also undertaken during this period were Leonardo's first systematic theoretical and scientific studies in anatomy, botany, mathematics, optics, and mechanics. At this time as well, he composed important parts of his treatise on painting and laid the basis for various other tracts on architecture, anatomy, and mechanics. At the court of Lodovico, Leonardo was an esteemed member of a circle of outstanding learned men concerned with the sciences, somewhat like the academies of Florence and Urbino. Here the artist met the mathematician Luca Pacioli, for whose *De divina proportione* he drew illustrations of geometric bodies.

The end of Sforza rule in 1499 terminated Leonardo's stay in Milan. He returned to Florence in April of 1500 by way of Mantua, where he made a preparatory drawing for a portrait of Isabella d'Este (PL. 119), and Venice, where he executed a plan of defense against the threatened attack of the Turks. At this time he began painting *The Virgin and Child with St. Anne* (PL. 122; cartoon, PL. 123, now displayed in London, Nat. Gall.). In May, 1502, Leonardo became military engineer in the service of Cesare Borgia and traveled for 10 months in Romagna, Umbria, and parts of Tuscany — the operational area of the leader of the papal forces. A good number of the artist's geographical maps and city plans, which are masterpieces of their kind and incunabula of modern cartography, were produced in the course of this activity. After his return to Florence, Leonardo was employed as a military engineer; he proposed a plan to divert the course of the Arno (cf. IV, PL. 268) in order to deprive the city of Pisa of its leading artery of communication in the war against Florence. This strategic undertaking led Leonardo to devise a project for the canalization of the Arno, which would have made the river navigable from Florence to the sea, rendering the adjoining regions profitable. These plans — and another project sent at this time to Sultan Bāyazīd II, for a bridge across the Bosporus — must be reckoned as Utopian conceptions. Nevertheless they were surprisingly farsighted for their time and were based on clear, correct constructional principles.

In 1503 Leonardo was commissioned by the Florentine Signoria to paint a fresco for the large audience hall of the Palazzo Vecchio, which was to represent a famous event from the history of Florence. His partner was Michelangelo, who selected for the opposite wall the theme of the Battle of Cascina. Leonardo's composition represented the Battle of Anghiari, depicting the struggle of the rival armies for possession of the standard. Hurriedly dried by means of a technically unsound process, Leonardo's painting suffered serious damage. It was never completed and was ultimately lost through the redecoration of the hall by Vasari. The composition is known only through copies and drawings by Rubens (PL. 119) and others, based on the original cartoon. At about the same time Leonardo painted the *Mona Lisa* (PL. 126) and the lost *Leda and the Swan*, known only through copies.

Leonardo was then at the height of his artistic reputation; he was greatly admired by Raphael and somewhat more reluctantly recognized by Michelangelo. Yet he produced relatively few paintings. Many commissions extended by famous persons remained unfulfilled, as Leonardo devoted himself increasingly to scientific endeavors. In addition to mathematical investigations he carried out systematic studies in anatomy, performing dissections on cadavers from the hospital of S. Maria Nuova. He recorded his findings in a detailed treatise on the construction of the human body, in which equal importance was given to the text and the accompanying anatomical illustrations. Leonardo's studies in biology and physics are equally impressive. Experiments concerning man's ability to fly led him to a study of bird flight, which he recorded in the Codice sul volo degli uccelli (Turin, Bib. Reale). Observations on the principles governing air currents and water were included in a work on theoretical and practical hydrology (Cod. Leicester, Norfolk, Holkham Hall, Earl of Leicester Coll.). But this period of activity was primarily devoted to the planning of Leonardo's comprehensive volumes on the primary forces of nature, comprising an entire cosmology.

In 1506 Leonardo interrupted work on *The Battle of Anghiari* in the Palazzo Vecchio and, released by the Signoria from his contractual obligations, moved once more to Milan, this time at the invitation of the King of France. Until 1513 he was active at the court of Charles d'Amboise, the French governor of Milan, for whom he designed a large residential palace and drew plans for the Chapel of S. Maria alla Fontana in the church of the same name. The preliminary studies for the monumental equestrian funerary monument of the military commander Gian Giacomo Trivulzio also date from this period, although, as in the case of the Sforza monument, the work was never carried out. Two nearly completed Madonnas "for the most Christian king" have disappeared without trace. While in Milan, Leonardo also devoted much of his time to scientific studies. His writings on anatomy in this period may have benefited from his acquaintance with the anatomist Marc Antonio della Torre of Pavia. Leonardo's hydraulic and geophysical experiments became more searching, as is shown by his important project for the Adda canal, which was to connect Milan with Lake Como, and by his astounding geological observations on the development of fossils. Finally, his precise graphic observations of botanical phenomena rank him, in this field as in others, the founder of modern scientific illustration.

Toward the end of 1513, after Giovanni de' Medici had ascended the papal throne as Leo X, the sixty-year-old Leonardo went to Rome, where he expected to receive commissions from his patron, Cardinal Giuliano de' Medici. However, apparently no great commissions such as were extended to

Raphael, Bramante, and Michelangelo were offered. Tangible traces of Leonardo's artistic activity are lacking for this period, although it is known that he had a workshop in the Palazzo Belvedere. The Roman years were occupied with scientific endeavors, particularly mechanics and anatomy, except for such archaeological studies as the attempt to reconstruct the plan of the antique harbor of Civitavecchia. There is only one painting, his last, that may have been a product of the artist's stay in Rome — the problematic *John the Baptist* (PL. 124).

In January, 1517, Leonardo changed his place of residence for the last time. He left Rome for France at the invitation of the French king, Francis I, who gave him the country house of Cloux near Amboise and granted him the title "Premier Peintre, Architecte, et Mechanicien du Roi." The infirmity of one hand, however, prevented Leonardo from painting, though the artist continued his scientific studies, especially in the field of anatomy. The only documented project of these later years is a plan for a large castle with gardens, intended as a residence in Romorantin for the Queen Mother. The building was not constructed, but Leonardo's plan is to some extent reflected in the castle of Chambord, begun under Francis I during Leonardo's lifetime. The most impressive documents of Leonardo's last years are the *Deluge* series (Windsor Castle, Royal Lib.), drawings in which are summarized the experience and experiments of a lifetime of investigating natural phenomena.

Leonardo was buried in the Church of St-Florentin in Amboise. His tomb, however, vanished in the destruction of the church during the French Revolution.

SUMMARY. Literary works (col. 209). Painting (col. 210). Sculpture (col. 217). Architecture and fortification (col. 219). Court art (col. 222). Scientific works (col. 223): *Mathematics, optics, and mechanics*; *Anatomy and physiology*; *Zoology and botany*; *Cosmology and other physical sciences*. Leonardo's thought (col. 233).

LITERARY WORKS. To the care of his loyal disciple and friend Francesco Melzi, Leonardo left his paintings, drawings, and entire literary works, including a vast number of notes on various subjects. Several large notebooks and numerous individual leaves amounting to a total of some thirty-five hundred densely filled sheets have come down to the present time. Yet this imposing mass of work represents only a part of the total of Leonardo's recorded activity. Other notebooks, known through documents, have disappeared or have survived only in a mutilated and incomplete state. A great many single leaves have also disappeared.

Nineteen books of Leonardo's work are known at the present time. These are either small sketchbooks, which the artist carried suspended from his waist for quick sketches of everyday events or scientific observations, or larger notebooks intended for scientific studies. One of the latter is devoted to the flight of birds, another to optics, another to architecture, another to the study of the properties of water; but these books were often, in the course of time, filled with notes not pertinent to the subject at hand. One manuscript, the Codex Arundel (London, Br. Mus.), contains writings and sketches on various subjects treated in separate folios but bound into one volume. Countless single leaves are dispersed in collections throughout the world. To this body of material must also be added the Codex Atlanticus (Milan, Bib. Ambrosiana), so named for its large dimensions, which stems from the collection of the 17th-century Milanese collector Pompeo Leoni. A sister volume found its way to England and is one of the major treasures of the Royal Library at Windsor Castle.

This vast *œuvre* constitutes the basic foundation and seemingly inexhaustible source of our knowledge of Leonardo's thought. It encompasses — in addition to biographical notes such as diary entries, accounts, snatches of correspondence, and excerpts from literary works read by the artist — the sum of his artistic and scientific studies. Leonardo habitually used reverse, or mirror-image, script and seldom wrote in the conventional manner. The easiest explanation for this preference lies in the fact that he was left-handed. Yet since even the most carefully written documents are in mirror writing, a better explanation is needed. The desire for secrecy has only limited validity; while it is true that Leonardo also arbitrarily broke up words and sentences and deliberately interpolated misleading punctuation, which makes reading of the text even more difficult than simple mirror writing, these additional mannerisms are relatively rare. The writing is clearly legible with the help of a mirror, and with some practice the reader will find Leonardo's script as accessible as any conventional one. His manuscripts are carefully executed, and text and drawings combine to form an admirable esthetic entity. There can thus be no question of an undecipherable code in his script. Perhaps the best explanation is that Leonardo did not intend these pages to be read by others but rather considered them a kind of personal written monologue that he wished to protect somewhat from the unwelcome glances of the curious; perhaps he was expressing his strong individuality. As he wrote in his *Treatise on Painting* (Rome, Vat. Lib., Cod. Urbinas lat. 1270, 31v), "If you are alone, you belong to yourself completely." Special methods, including the "paleografia vinciana," have been devised to analyze the literary works of Leonardo with the aim of establishing a chronology. A pioneer in these studies was Gerolamo Calvi, whose work (1925) was the point of departure for all subsequent investigations.

Leonardo often referred to himself as "omo sanza lettere," an ignorant man; nevertheless, his education, which was surely more extensive than that of a common artisan, and, above all, his great intelligence gave to his work a cultural scope that is truly exceptional. Although Leonardo's knowledge has unmistakable limits (it has been too customary to consider him a wizard in all branches of science), it would be erroneous to present a totally negative view, as has Leonardo Olschki (1919), and to deny the originality of his self-education. The more objective judgment of Eugenio Garin (1952) concerning Leonardo's philosophical principles and the factual presentation of Leonardo's language and style by Augusto Marinoni (1944–52) provide surer and more fruitful guides. The work of Pierre Duhem (1906–13), together with that of Edmondo Solmi (1908), constituted the most comprehensive statement of Leonardo's cultural scope for the preceding generations but should now be superseded by an entirely new investigation of the subject. Leonardo's manifold interests and achievements still need to be examined in their historical context and reevaluated. That the underlying basis of both his artistic and scientific activity constitutes a unified whole, informing every aspect of his thought, is repeatedly demonstrated in his work.

PAINTING. Leonardo's output of paintings was unusually small. A total of seventeen commonly accepted works has been preserved, and of this total, four are unfinished. Five or ten additional compositions have been documented, and a fraction of this number has come down through the medium of contemporary copies. The majority of Leonardo's paintings were executed in the earlier part of his life, in the period 1473/75 to 1500. *The Virgin and Child with St. Anne* (PL. 122) and the *Mona Lisa* (PL. 126) were painted between 1500 and 1507, while in the same years the *Madonna with the Yarn Reel*, *Christ among the Doctors*, *The Battle of Anghiari*, *Leda and the Swan*, *Bacchus*, *Salvator Mundi*, and *Angel of the Annunciation* were begun but remained unfinished; they are known to us only through drawings and copies.

In addition to these few and often fragmentary works, a large number of sketches and composition projects is known. These studies, which extend from the artist's earliest youth until his last years and are climaxed by the grandiose invention embodied in the series of *Deluge* drawings, demonstrate that Leonardo considered drawing to be an independent and self-sufficient medium. In fact, the appraisal of Leonardo's significance as a painter depends in large measure on the evaluation of his work as a draftsman.

At the time of Leonardo's collaboration with Verrocchio on *The Baptism of Christ*, he had just achieved the status of master. At the age of twenty his remarkable gifts were already apparent. The seemingly effortless mastery of technical and representational means is accompanied by an expressive quality

that sets his angel apart from the other figures in the painting. The pose of the kneeling angel is relaxed, introducing a diagonal movement of the body that later became characteristic in Leonardo's work, and is composed along a number of axes that create a multiplicity of movements. The fine quality of form, the delicacy of the modeling through soft shading, and the organically articulated folds of the drapery of Leonardo's figure stand out from the rest of the painting. Leonardo's touch is also visible in the *Baptism* in the section of landscape above the angels. This small portion of nature is pervaded by a new artistic vision. The same qualities can also be seen in a remarkable pen drawing (IV, PL. 271) made in 1473, a subtle combination of imaginative fantasy and observation of nature, which can be regarded as the first truly modern landscape rendering. Although the composition shows traces of traditional schemes of landscape representation, such as the rocky elements in the foreground and the precipices in the distance, there is a new interest in the precise recording of optical sensations. This is apparent in the atmospheric space that unifies the landscape and separates the observer from the object of his vision, imparting to the latter an authenticity of its own. The effect of light and humidity upon the material world is carefully recorded; some forms are sharply delineated, others consumed in haze.

This interest in the appearance of the natural world in the 1473 drawing was conditioned by Leonardo's striving toward comprehension of natural phenomena, which he had recorded objectively since youth. He sought an artistic means whereby the new perceptions could be represented, a graphic language that could provide an adequate reflection of his intense observation. In both the drawing of 1473 and the landscape in Verrocchio's *Baptism* he succeeded.

The harmonious combination of movement and expression that distinguishes the angel in the *Baptism* is also found in the later works of the master. The gestures and expression in the *St. Jerome* (PL. 115) produce a convincing pathos. In his *Treatise on Painting* Leonardo repeatedly emphasizes the expressive character of movement and gesture: "A good painter has two subjects of primary importance: man and the state of his mind. The first is easy; the latter difficult, since it must be conveyed by means of the gestures and movements of various parts of the body. This one should learn from the deaf-mutes, for they express themselves better in this way than any other group of human beings" (Rome, Vat. Lib., Cod. Urbinas lat. 1270, 60v).

In their attempt to capture the external appearance and inner essence of every phenomenon, Leonardo's studies of nature differ from those of other artists of his time. He became interested at an early date in the emotive potentiality of certain expressions of the face. A leaf of sketches drawn about 1480 shows the head of a screaming man with a wide-open mouth juxtaposed with the snarling heads of a lion and a dog; the similarity in the expression of rage in man and beast is recorded here perhaps for the first time. An entire theory of physiognomy grew out of such systematic studies.

A large number of extant preparatory sketches for *The Adoration of the Magi* (PL. 117) permits an insight into Leonardo's method of work. These sketches include studies of the movement of individual figures, a detailed construction of the setting in central perspective, and a trial drawing for the entire composition. All these preparatory sketches are reflected in the final, although unfinished, version. The rocky projection in front of which Mary is seated divides the setting of the action into a foreground and a background, thus resolving the problem of an open central space that must be filled with figures or remain uncomfortably empty. Formally and thematically the elements of the painting are disposed from the center to the edges in a descending rhythm. The classic triangular composition of the central group, which Leonardo used here for the first time, helps coordinate all individual action into a cohesive whole. The two figures standing at the lower corners of the painting — the older one immersed in the contemplation of the event, while the younger stares out of the picture — seem to connect the real world with the pictorial space. Our eye is led through these flanking figures to the main participants in the action, and from these to the shadowy surrounding figures seen as a multitude rather than as separate individuals. In the interplay of expressions and gestures the seemingly uncoordinated mass of hands echoes every shade of emotion shown in the faces of the shepherds. In the unfinished state in which it was left, the painting is a demonstration of Leonardo's chiaroscuro technique. The artist did not introduce color, which remained of secondary interest to him, until a late stage in the execution of a painting. His vital concern was for modeling in light and shade, the representation of the substance and weight of objects in terms of their proper tonal value in relation to the surrounding space.

"...ber, 1478, I began the two Virgin Marys," Leonardo wrote on one of his early sheets of sketches (Florence, Uffizi). In an inventory of works in his atelier made toward the end of 1481, in connection with his departure for the court of Milan, he noted, "a Virgin Mary, almost completed" and "a Virgin Mary." Of these paintings, on which the artist worked during the last years of his stay in Florence, only one has been preserved: the so-called "Benois Madonna" (Leningrad, The Hermitage). Even though unfinished and uneven in execution, this small work is an eloquent witness of the rich creative gifts of the twenty-six-year-old master and a new, imaginative interpretation of one of the oldest themes of Christian art. The youthful Madonna offers her Son a flower taken from a bouquet in her hand. The representation of the Child in the act of reaching for the flower shows great insight and observation. Beneath this simple and playful gesture, and in the face of the Christ child, there is an earnestness which reveals once more the artist's interest in the dramatic content of gesture and facial expression.

In addition to the above-mentioned works, other early paintings of the artist include the small "Dreyfus Madonna" (Washington, D.C., Nat. Gall.), as well as the *Virgin and Child* (Munich, Alte Pin.), the two Annunciations (Uffizi and Louvre), and the "Portrait of Ginevra Benci." Of varying quality and states of preservation, these paintings are characteristic products of Verrocchio's workshop, where, side by side with Leonardo, other young painters, including Botticelli, Lorenzo di Credi, and Perugino, were active. Yet each of these early paintings, qualitatively far above typical renditions of similar subjects, reveals the hand of the artist. The most important work of the group is the portrait (in all likelihood Ginevra Benci) that Leonardo painted in Florence, according to a contemporaneous source. The panel has been cut down; it originally extended almost 8 in. beyond the present lower edge. As indicated by traces under the layer of overpainting below the lace of the bodice, the missing strip showed the hands of the sitter, probably in the same quiet and graceful pose illustrated in a drawing now in Windsor Castle (12558). As originally completed, the portrait fits naturally into the tradition of late-15th-century portraiture, although set apart by the unconventional composition. The roundness of the head, the arrangement of the hair, the curious slant of the eyes, and the restrained seriousness of the expression relate to the style of Verrocchio. However, the execution of the painting, the soft yet precise modeling, especially of the forehead and cheeks, has a rich chiaroscuro unique with Leonardo. The juniper bushes (*ginepro*, or *ginevro*) that serve as a dense, dark foil for the head, enhancing its luminous quality, are masterfully conceived. This apparently opaque foliated background has a delicate quality that creates not a wall but a translucent curtain leading the eye smoothly into the distance. The beautifully formed spaces in the bushes at the left are islands of light, the lower one with its network of brush shielding the foreground. As in the "Benois Madonna," Leonardo has transformed a conventional and well-established pictorial type into a personal statement of great originality.

Immediately following *The Adoration of the Magi*, which had been left behind unfinished in Florence, Leonardo painted *The Virgin of the Rocks*. The first of the two versions (Louvre; PL. 121) was painted by Leonardo about 1483–86 as the center panel of an altarpiece. The wings, showing angel musicians

(London, Nat. Gall.), were executed by Ambrogio de Predis. The painting was removed from its intended place, the Chapel of the Order of the Immaculate Conception in the Church of S. Francesco in Milan, perhaps by the Duke of Milan, who either kept it himself or gave it away. The painting is known to have been in the possession of the French royal house in 1625, having perhaps been acquired by Louis XII. To replace this picture in the chapel, Leonardo and Ambrogio de Predis painted a second, slightly different version, begun about 1494. This painting was the subject of a 10-year lawsuit concerning the fee, brought against the order by the artists. The dispute was finally settled in the artists' favor in 1506, whereupon the picture was delivered to the patrons. This second version of *The Virgin of the Rocks* (PL. 120) remained in the chapel in S. Francesco until the dissolution of the order in 1871. It was acquired by the National Gallery in London in 1880 after several changes of ownership.

The first version of the picture shows Leonardo's art in its mature phase, depicting the legend of an encounter in the desert between the young St. John and the infant Christ on the journey home from Egypt. The legend arose during the Middle Ages, probably on the basis of an apocryphal source. It did not make its appearance in art, however, until the 15th century, when it became a part of the infancy cycle of John the Baptist, especially in certain towns of central Italy, where the Baptist was venerated as patron saint. In Florence after the middle of the 15th century, the little St. John (S. Giovannino) began to be represented in paintings of the Virgin. Leonardo's version is a classical rendition of this theme. The pyramidal grouping of the figures, first employed in an early drawing and in the Uffizi *Adoration*, reappears in *The Virgin of the Rocks*. Later it became one of the most popular compositional devices of the Cinquecento and was repeatedly used by Raphael.

The effectiveness of Leonardo's *Virgin of the Rocks* is in large part due to a visionary quality that removes this painting from the realm of pure reality. Since true form for Leonardo is always modified by effects of light and atmosphere, every optical impression is in a certain sense also a vision. Leonardo creates this effect in *The Virgin of the Rocks* through aerial perspective, by suffusing his composition with a misty atmosphere. In the dim light of the cave, each form seems to emerge from a fine mist. The group of figures stands between two sources of light. One source, originating in the distance, brightens the rear of the cave but is too weak to illuminate the figures in the foreground. A second source, shining from the front, is trained on the figures and distributed in fine gradations over each. No brighter than the first, its most intense shafts are directed to the head of Mary and the body of the Child, while St. John and the angel receive slightly less illumination. The expressive blessing hand of the Virgin, emerging from the darkness, appears to float in space. The gossamer veil that seems to separate the viewer from the pictorial stage is a technical effect achieved through *sfumato* painting — the eradication of the hard outlines of objects by means of soft gradations of tones, which renders form primarily through the play of surface and light. The head of the Virgin is delicately modeled in tones from dark to light, the forms articulated without the aid of outlines. That Leonardo often consciously avoided sharp outlines but articulated surface areas to produce form is shown in a study for this painting (Turin, Bib. Reale). Within the softly modeled contours of the angel's head, the inner forms in this study are defined by a dense system of hatching that is peculiarly Leonardo's. The tightly massed strokes manipulated by a sure hand are subtly varied in strength and density, some broad, some broken, and the total effect is a clear, relieflike definition of form. A successful interplay of graphic and painterly means has been employed. The precise linearity of the plants and of certain folds of the garments contrasts strongly with the more painterly effects of the broadly modeled areas. This contrast is evident in the figure of the infant St. John, modeled primarily by means of chiaroscuro and thus set off from the precise graphic treatment of the surrounding foliage.

Leonardo's painting *The Lady with an Ermine* (PL. 124) is believed to be the portrait of the youthful Cecilia Gallerani mentioned in contemporary letters. Because of heavy repainting and poor preservation, however, the identification cannot be absolutely certain. Yet no Milanese painter other than Leonardo could have conceived such a masterful pictorial conception. The original quality of the execution is still evident in the delicate face and in the graceful hand that rests on the back of the ermine. Cecilia was the mistress of Lodovico Sforza at the time Leonardo painted her portrait, and the ermine, often used as an emblem by Lodovico, is added evidence for the identification of the painting. The *Portrait of a Musician* (Milan, Ambrosiana), rightly attributed to Leonardo in view of its outstanding quality, may also be placed in the 1490s in the artist's Milanese period.

Ten years after *The Virgin of the Rocks*, Leonardo painted his *Last Supper* (PL. 125; XII, PL. 61). He began working on the fresco in the refectory of the Convent of S. Maria delle Grazie in 1495, at the request of Duke Lodovico. Three years later the work was completed. Leonardo's slow, meditative working process was entirely at odds with the existing technique of fresco painting. In order to maintain his own work habits, Leonardo invented a new technique consisting of a mixture of oil and tempera on stone, necessitating the prior treatment of the wall surface with a ground capable of receiving oil paint while insulating the wall against humidity. Contrived by Leonardo from a mixture of mastic and pitch, the ground did not hold, and soon the paint began to peel from the wall. As early as 1517 the painting was described by the Cardinal of Aragon as seriously damaged, and by the middle of the century it was in ruinous condition. The process of disintegration could not be halted. The work was often retouched in the course of time, and by the beginning of the 19th century only a few traces of its former greatness could still be seen. It was not until the 20th century that it became possible to arrest further disintegration through modern methods of restoration. Freed from later overpainting, the little that remains of the work still creates a powerful and unforgettable impression and in part retains the splendid luminosity of its colors.

The group of *The Last Supper* is placed in a somewhat confined space, the monumental figures crowded around the table. The use of figures seemingly too large for the space they occupy — one of the principles of classical composition — appears here for the first time in Leonardo's work. The perspective is an illusionistic continuation of the refectory where the fresco is situated, expanding the real space in which the viewer stands. The illusion is heightened by the imitation of linens and utensils actually in use in the monastery. Yet within this realistic space the figures are represented larger than life, and through their presence the space itself seems to expand. In the later work of Leonardo and of many who came after him, including Raphael and Michelangelo, this space-creating principle became one of the tenets of classicism in painting. Leonardo's composition is a skillfully coordinated and rhythmically compelling statement of its theme. The pause between two phases of an action, the momentary shock that freezes the disciples for an instant before they break into violent motion, is in *The Last Supper* presented in its most consummate form. The play of gesture, expression, and movement and the response of each of the figures in a manner appropriate to his inward disposition have contributed to make this first work of Renaissance classicism, despite its tragically deteriorated state, one of the most perfect artistic creations of all time.

Immediately following completion of *The Last Supper*, Leonardo conceived the design of *The Virgin and Child with St. Anne* (PL. 122), which was to become a model for the most outstanding Italian masters. The painting was executed after the artist's return to Florence after the fall of Duke Lodovico of Milan in 1499–1500. The painter resided in the Monastery of the SS. Annunziata as a guest of the Servite monks, and it was here that he worked on his new picture, apparently without commission. According to Vasari, the entire city of Florence watched the progress of the work of the artist, who, almost fifty years of age, stood at the peak of his reputation. Historically the picture marks a turning point in Italian painting. Not easily resolved pictorially, the theme is presented by Leonardo in an

entirely new form. In a break with existing iconographical tradition, the Virgin is shown seated on the lap of St. Anne. With a graceful forward motion she tries to restrain the Christ child from playfully riding the lamb. The dynamic tension that invests the picture was sensed in Florence as something new. The figures are shown in a relatively confined spatial setting which lacks a middle ground, and the depth of the space is less the result of perspective illusion than of the great space-creating volume of the figures themselves. The background landscape is little more than a distant prospect, lacking direct connection with the sphere of action of the figures. The influence of this painting on the art of the following generations was enormous, and for masters such as Raphael, Andrea del Sarto, Fra Bartolommeo, and Michelangelo, as well as for the mannerists, it became the ideal example of a classical composition. Even in the north, Massys' elaboration of the composition testifies to the far-reaching interest aroused by Leonardo's painting.

In *The Battle of Anghiari*, begun in Florence in 1503, Leonardo attempted a grandiose evocation of a historical event documented in detail in literary sources. A number of trial studies for the work reveal his basic intention to represent within a single composition several episodes of the battle. The thematic and compositional high point was to be the struggle over the flag, which took place on the approaches of a bridge. The studies for the composition show a gradual increase in the importance given to the combat over the flag. The group of fighting riders, which occupies the center of the wide narrative composition, was continually simplified until in its final state, as seen in Rubens's copy (PL. 119) and finally executed on the wall, the four riders entangled in fierce combat became the classic model for battle representation. Leonardo's composition, which served as a study piece for painters from Raphael to Delacroix, has come down in numerous copies of the 16th and 17th centuries. The fury of battle is represented as an uncontrolled animal instinct in which man and beast show the same frightful distortions of distended upper lip and bared teeth, a similarity already studied by the artist in earlier sketches. The heads of the fighting riders show an expressive distortion of the facial muscles also seen on the heads of a horse and a lion on an earlier leaf of sketches in Windsor Castle; these examples show how Leonardo combined scientific study and artistic expression in this later painting. As a composition the group of fighting riders is characterized by the same quality of balance found in *The Virgin and Child with St. Anne*. In contrast to the restrained calm of the latter, however, the struggling group in *The Battle of Anghiari* is full of harsh movements confined within a tightly bound form. The boundaries of this form not only describe the shape assumed by the action but serve to imprison its explosive energy, to prevent any escape of intensity. The energy presses inward as if bound to a gravitational center. The opposing horses appear locked in hermetic and motionless combat. As in *The Virgin and Child with St. Anne*, an understanding of the physical principles of force and counterforce is applied in the formulation of *The Battle of Anghiari*, and both works show a moment of arrested action rendered with great sense of strength and plasticity. It is not surprising that in preparation for the latter Leonardo made, according to his own testimony, a number of small three-dimensional sketches in wax, and that the finished work inspired a series of sculptures of equestrian combats — the terra-cotta groups of the Florentine sculptor Giovan Francesco Rustici.

During the years in which Leonardo worked on *The Battle of Anghiari* he also painted the *Mona Lisa* (PL. 126). This is the work most closely identified with the art and spirit of the artist. All that is known about the background of this painting is based on the brief note of a contemporary stating that Leonardo painted the portrait of the wife of the Florentine merchant Francesco di Bartolommeo del Giocondo; hence the picture's other name, *La Gioconda*. Although the painting has darkened and lost its original delicacy and lightness of color, the fine execution and the simplicity of pose take on more meaning and subtlety with closer scrutiny. Body and head, hands and arms, are related to one another by almost imperceptibly varied directional axes of movement, resulting in a harmonious and lively effect that has served as a model for portraiture up to our own time. The famous and oft-discussed smile of the sitter is the key to the apparent "mystery" of the *Mona Lisa*. It represents the subtlest stage in the transition between a motionless, expressionless human face and the first delicate enlivening. All expressive possibilities are open, and much has been read into the smile. Yet it produces no specific emotion, neither rejecting nor inviting, reflecting rather a state between nearness and distance, a sense of being apart. Thus questions concerning the sitter's personality are of doubtful value. The *Mona Lisa* represents the ideal female portrait, a type continued from Raphael to Corot.

For the lost *Leda and the Swan*, it has been surmised that the cartoon for the painting must have been made in Florence; a *Leda* has been found among Raphael's drawings executed in Florence about 1505, after works of Leonardo. However, since all later preserved copies of the painting stem from Leonardo's Milanese following, it may be surmised that the artist took the work from Florence to Milan and completed it there, as he did with *The Virgin and Child with St. Anne*. In his *Leda*, Leonardo created the classic type of standing nude figure for Italian art. Few other works by great masters have exercised such a profound influence on succeeding generations. Standing in the classical *contrapposto*, the lovely female body was constructed on many varied directional axes and presented a rich variety of aspects. Through Raphael, who based the standing pose of one of the philosophers in his *School of Athens* on the Leda, this figure became a model type in High Renaissance art. In addition, the gentle turn of the torso to one side, contrasting with the turn of the head in the opposite direction, while the arm is elegantly stretched across the body, provided the archetype for the famous *figura serpentinata*, the ideal mannerist figure, designed to combine in one pose as many viewpoints as possible, imparting to the body a spiral effect. More animated than the classical *contrapposto* stance, yet more classically constructed than the serpentine figures of mannerism, Leonardo's Leda has a statuesque quality which might well impress a sculptor. It is possible that the change in Michelangelo's style that separated the still classical pose of the *David* from the early figures executed for the tomb of Pope Julius and the vehemently animated *Matthew* may have been partly influenced by Leonardo's Leda. The so-called "David Apollo" (Florence, Mus. Naz.) indeed seems like her sculptural brother.

The soft, dense modeling on a sheet of preparatory drawings for the *Leda* (Windsor Castle, 12516), suggests the same gently swelling forms seen in all the preserved copies of the painting. Leonardo's original probably had a strongly sensuous quality. With the exception of a *Bacchus* which Leonardo was commissioned to paint for the Duke of Ferrara but which was probably never executed (the *Bacchus* in the Louvre is the poor work of an unknown follower), *Leda and the Swan* represents the only subject drawn from classical mythology treated by Leonardo. Those who believe that the painting carries a hidden meaning are probably not mistaken. Leonardo may have used the myth to represent the symbol of female creation. The double embrace and softly yielding pose of the figure suggest surrender; and the children, just emerged from the egg, are a symbol of fertility. Perhaps Leda should be interpreted as the mother-earth goddess Gaea. Here even more than in the *Mona Lisa* Leonardo has presented an enigma. For the first time he has combined an open sensuousness with a veiled, symbolic meaning.

After this Florentine period, Leonardo gave most of his time to scientific research and seldom again made use of the brush. Commissions extended to him by the King of France through his governor in Milan were undertaken only with reluctance. The two Madonnas, which in a letter to the governor he designated as near completion and soon to be delivered, were probably not new creations but reworkings of the earlier compositions of the "Benois Madonna" and the *Madonna with the Yarn Reel*. During his stay in Rome (1513–17) as well, the artist apparently painted little. *John the Baptist* (PL. 124),

the one extant painting of Leonardo's late years, shows a mysterious figure that appears at the same time to emerge from and retreat into the dark background. Once again Leonardo created for one of the most frequently represented themes in Christian art a spiritual and formal interpretation that has no known prototype. While in the past Leonardo had habitually gone beyond the traditional limits of Christian iconography, this last work represents his freest and boldest elaboration of a religious pictorial theme. Outwardly St. John remains faithful to the figure of the Gospel; he carries the attributes of the preacher in the wilderness. Yet his bearing suggests that his message is not the prophecy of deliverance, and his smile suggests not transfiguration but the inscrutable secret of divine intention, the eternal mystery which hangs over human destiny.

In the same period during which he painted *John the Baptist*, Leonardo also began to draw his visions of the end of the world. Though based on the theme of the Deluge, these drawings constitute a complete break with traditional representations of the Biblical episode; Leonardo's artistic and scientific imagination are fused in a great synthesis that symbolizes his entire cosmology.

SCULPTURE. That Leonardo worked in sculpture from his youth onward is known from his own statements and through other sources. In the workshop of Verrocchio he became acquainted with such techniques of this art as modeling in wax and clay, stone carving, and bronze casting. He may have participated in Verrocchio's project for the Medici tomb in the Old Sacristy of S. Lorenzo. He must also have witnessed the execution of the Forteguerri monument for the Cathedral of Pistoia and the St. Thomas group for Orsanmichele in Florence. Undoubtedly Leonardo saw and thoroughly studied the model of Verrocchio's monument to Bartolommeo Colleoni, which was taken from Florence to Venice in the summer of 1481.

In his petition to the Duke of Milan (1481–82) Leonardo mentioned his ability to work in marble, bronze, or clay and offered to execute the equestrian monument of Duke Francesco. In a draft of a letter of about 1498, he urged the building commissioners of the Cathedral of Piacenza to select an able master for the task of creating the great bronze doors of the Cathedral, then being planned. He stressed his own qualifications in bronze casting and seemed himself to be bidding for the commission. In his *Treatise on Painting*, weighting the merits of painting against those of sculpture to the advantage of the former, he wrote, "As I practice myself the art of sculpture no less than that of painting, and doing both the one and the other in the same degree, it seems to me that, without being suspected of unfairness, I may venture to give an opinion as to which of the two is more intellectual and of greater difficulty and perfection" (Paris, Inst. de France, Ms. 2038, 24, 25).

Of Leonardo's sculpture nothing is preserved, if in fact any of his projects was ever carried beyond the stage of clay or plaster models. All attempts thus far to attribute to him various objects in bronze or stone must be rejected. The only work which has been related with any plausibility to Leonardo's art, specifically to the works of his early Florentine period, is the beautiful terra-cotta *Madonna and Child* (London, Vict. and Alb.), which has recently, however, been more convincingly attributed to Antonio Rossellino. Leonardo's achievement as a sculptor can thus be inferred only from the influence of his projects on other artists and from his relationship with his student G. F. Rustici, one of Leonardo's most talented followers, who became especially interested in equestrian sculptures.

Leonardo was called to Milan to execute a colossal equestrian statue of Duke Francesco Sforza, on which he worked with extended interruptions from 1483 to 1498. In the first period of work (1483–89) he designed a composition which completely broke with tradition, representing a departure from the classical type of equestrian monument transmitted from the *Marcus Aurelius* on the Capitoline hill (X, PL. 148) to Verrocchio's Colleoni monument. The rider was not shown quietly seated on his horse but was mounted on a rearing one, a plan which was not only new but was also unusually difficult to execute. Many drawings, among them a fine silverpoint study in Windsor Castle, have transmitted to us his first plan, which resembled, and may have been inspired by, an earlier design made by Antonio Pollaiuolo for the Sforza monument (Pope-Hennessy, 1958). Leonardo made a thorough study of the difficult technical problems involved and apparently found a workable solution not only for the casting procedure but also for the resolution of the static stresses. A sketch in Windsor Castle (12349r) shows the design of the mold as well as the inner iron framework destined to be inserted within the mold for reinforcement. Calculations of the stresses made by Leonardo show his thorough understanding of the principles of mechanics and his ability to apply them in the service of his art. He also had explored the possibility of an outer support in the form of a fallen warrior trampled under the hoofs of the horse.

Leonardo did not, however, carry through this first design and, beginning in 1490, returned to the type of the quietly standing horse. The trial sketches of the following years are intensive studies after nature of horses from the stables of the Duke and other noblemen, including an entire series of motion studies and systematic investigations of individual parts of the animal. He also turned his attention to existing equestrian monuments, not merely the *Gattamelata* and the Colleoni monument but also the so-called "Regisole," the late-antique equestrian monument in Pavia, which he admired for its beauty, the natural quality of its motion, the trot which had "almost the quality of a free horse" (Milan, Ambrosiana, Cod. Atlanticus, 147r). The final version of the design for the Sforza monument and a clay model were thus eventually completed, and in November, 1493, on the occasion of the wedding of Bianca Maria Sforza to the emperor Maximilian, the model was publicly exhibited, arousing great admiration. It remained on view in the courtyard of the castle and was still seen there in 1498 by Luca Pacioli, who noted its colossal proportions — over 20 ft. from head to foot, or about twice the size of the Colleoni monument. A sketchy drawing by Leonardo of the wooden crating that was probably used to transport the model to its place of public exhibition gives some impression of the powerful tension in the mighty body of the horse, in which the massive, compact forms of the *Gattamelata* appear to be combined with the animated intensity of the Colleoni work to form a monumental new conception. However, with the downfall of Lodovico and his expulsion from Milan, this project along with many others had to be abandoned.

A more specific idea of the intended final form of the Sforza monument can be obtained from the preparatory sketches for a second equestrian statue on which Leonardo began working between 1511 and 1513. The *condottiere* Gian Giacomo Trivulzio, who in 1499, while in the service of the King of France, had wrested Milan from the usurper Lodovico Sforza, commissioned Leonardo to execute his funerary monument, which was to stand in the family mortuary chapel in the Church of S. Celso in Milan. A precise description of the projected work can be found among Leonardo's papers. The life-size equestrian statue was to stand on a richly decorated base that was toho use the sarcophagus of the deceased. Even though considerably smaller than the Sforza monument and differing from it in function, the basic conception behind the two works is the same. A large number of life and motion studies again attest to the concentrated effort leading up to the formulation of Leonardo's unconventional solution. Like the Sforza monument, the project for the Trivulzio tomb was never executed in final form, and thus two of the boldest designs on the equestrian theme in Renaissance sculpture did not materialize.

Leonardo was almost sixty years of age when he began work on this project. As in the studies for the Sforza statue, he appears in time to have abandoned his plan for a rearing horse in favor of a striding one for the Trivulzio monument. His preparatory sketches (PL. 118), distinguished by the powerful, curving, form-defining lines of his mature style, show the experience gained by the artist in his work on *The Battle of Anghiari*, which helps to account for the differences in the drawings for the two equestrian works. The second series of preparatory studies shows a greater feeling for volume. The forward movement of the horse

is checked by the bridle. In comparison to the Sforza project, the potential motion of the animal seems to be constrained within the posture of the tightly reined head, heightening the effect of tension. At the same time the design of the rider shows, despite its indebtedness to the Sforza type, an effort to stress the domination of the human figure over that of the horse. The influence of the "Regisole," with its livelier gait emphasized in the raised rear leg, seems to predominate over that of the *Marcus Aurelius*, *Gattamelata*, and the Colleoni monument.

Leonardo's impressive drawings for his equestrian monuments must have had a strong impact. A number of sculpture groups from the beginning of the Cinquecento employing the motif of the mounted rider are derived from his designs, although it cannot be determined whether they were transmitted through drawings or through models in clay or wax. Among these are a beautiful bronze group in Budapest and the terra-cotta groups by Rustici in Paris and Florence. The influence of Leonardo's doctrines can be felt in other types of sculpture as well — for example, in Rustici's three larger-than-life bronze figures of the preaching John the Baptist flanked by two doubting priests, above the north door of the Baptistery in Florence (XII, PL. 57). Vasari, who must have known Rustici personally, wrote in his life of Leonardo concerning the modeling of these figures: "They were executed by Giovan Francesco Rustici, but under Leonardo's direction, and are the finest casts for design and general perfection that have yet been seen." In his life of Rustici, Vasari amplified this account: "While engaged upon this work Rustici would allow no one near except Leonardo da Vinci, who never left him while he was modeling in clay and casting, until the work was finished. Many therefore believe, though nothing definite is known, that Leonardo worked at them himself, or at least helped Rustici with his advice and judgment." On the basis of a note in Leonardo's own hand in the Codex Arundel (263; London, Br. Mus.) it is known that he and Rustici shared a house for a period of six months at the most crucial time during the execution of the figures.

The composition of Rustici's group as well as the structure of the individual figures must undoubtedly be credited to a large extent to Leonardo. The stance of the so-called "Levite," a thickset, muscular figure; the organic fall of the drapery; and the contrast between the coarse expression of the Levite and the refined gaze of the Pharisee all point to Leonardo's spiritual participation. This sculptural group of three figures is the single instance, although largely obscured by the hand of another artist, of a completed piece from which some insight can be gained into Leonardo's work in this medium. With the exception of the equestrian statue, sculpture apparently interested him little, and sculpture in stone not at all. His criticism of sculpture in the *Treatise on Painting*, which repeats arguments found in Lucian, was aimed primarily at work in stone. A decisive factor in Leonardo's attitude is the irrevocable nature of stone sculpture, which does not permit the artist continually to formulate new ideas in the very process of the work. The only form of sculpture possible for Leonardo was modeling in wax, clay, or plaster, which allowed a slow, continuous, and always alterable development of an idea until a final model could be achieved and then cast in bronze.

ARCHITECTURE AND FORTIFICATION. In Leonardo's famous letter of petition to the Duke of Milan he itemized his experience as an architect. "In time of peace I believe that I can give perfect satisfaction, and to the equal of any other, in architecture, in the design of buildings public and private, and in guiding water from one place to the other" (Milan, Ambrosiana, Cod. Atlanticus, 391r). A document dated 1490 mentions Leonardo, along with Bramante and other masters, as "ingeniarius et pinctor." The account books of the building operations for the Cathedral of Milan also show that Leonardo participated in the competition for the design of the dome of the Cathedral between 1487 and 1490, having entered a model of his proposed project; however, he withdrew before the decision of the judges was announced. His services as an adviser were often sought. He was consulted by the builders of the new Cathedral of Pavia (1490) and in connection with damage suffered by the Church of S. Salvatore al Monte in Florence (1500). About 1502 he devised a plan for a gigantic bridge across the Bosporus for Sultan Bāyazīd II. In 1506 Charles d'Amboise, the French governor of Milan, had high words of praise for certain architectural projects which Leonardo had designed for him, probably a palace and the Chapel of S. Maria alla Fontana. During his last years in France the artist made plans for a large castle intended for the mother of King Francis I, which was to be constructed in Romorantin (1518). Despite this activity, however, not a single finished building can with certainty be attributed to Leonardo.

His sketchbooks, on the other hand, and some independent leaves were filled with architectural designs from all periods of his life, including military constructions, city plans, buildings for sacred and secular purposes, architectural details, and theoretical studies. With the exception of a few individual studies and rather modest illustrations in architectural treatises of the middle of the century, Leonardo's designs (PL. 118; I, PL. 406; III, PL. 485) are the first architectural drawings of the Renaissance which to a significant extent reveal the architectural climate of the time.

Whenever Leonardo became involved with a specific building project, he evolved from the task at hand principles of a general application far beyond the immediate requirements of the problem. In the design for the dome of the Cathedral of Milan, the problem was to invent a suitable crowning element for the crossing of the huge late Gothic structure which would at once be structurally consonant with the Gothic piers and in esthetic harmony with the elaborate decorative style of the building. In contrast to the works of his Lombard competitors, Leonardo's project called for a freestanding dome in the Tuscan manner which was to consist of a bold, double-shell construction. This design, however, conflicted with the Milanese tradition, which favored towers over the crossing; this may have been the reason for his withdrawal from the competition. From his systematic investigation of the problems connected with the construction of this dome, however, Leonardo was able to broaden his understanding with a series of studies on dome construction and design in general. His studies reveal that he was generally more inclined toward theoretical than practical architectural problems; and in actual construction he was called upon to advise rather than to serve as working architect.

It is significant that for 17 years, while at the court of the Sforzas, Leonardo lived and worked side by side with Bramante, one of the greatest architects of his time. This contact stimulated Leonardo's interest in important artistic problems of the period, including the centralized building plan and the designing of monumental palace and church façades, as well as his concern for the technical aspects of construction, which represented the practical application of those principles of statics and mechanics that had interested him as a theoretician.

The idea of systematizing his thoughts and studies on architecture seems to have occurred to Leonardo at an early date. One of his sketchbooks, Manuscript B in the Institut de France, was originally intended as a pattern book of architectural types. In addition, other studies (in Mss. A and B and in the Cod. Atlanticus, Arundel, and Trivulzio) reveal a planned organization and can in all likelihood be recognized as preparatory studies for a treatise on architecture. Taken as a whole, these studies form the outlines of an ambitious architectural theory, which was to have given to the collective knowledge of construction of the period a coherent and systematic form. Numerous individual sketches may be regarded as preparatory for this project, which would undoubtedly also have included Leonardo's work in connection with specific constructions. The plans include all varieties of urban construction and designs for ideal centralized or longitudinal buildings employing innumerable combinations of spatial arrangement. In this realm Leonardo proved himself a gifted mediator between northern and central Italian architectural traditions. His drawings show efforts to transform, through architectural clarity and tectonic severity, the rich forms of Lombard centralized buildings into a more coherent and sober mode. Thus arose a veritable catalogue of designs. The intended treatise forms an important link

between the simple spatial complexes and architectural theories of the early Renaissance and the intricate constructions of the High Renaissance and provides a unique representational survey of the great development which Italian architecture underwent at the end of the 15th century. The style of the early Renaissance, based upon the principles of Brunelleschi, Filarete, Francesco di Giorgio Martini, Alberti, and Laurana, entered its classical phase in the work of Bramante and Leonardo. Not a single drawing by Bramante from his Milanese period has been preserved to record the transition from his buildings in Milan, which are still completely in the early Renaissance tradition, and his post-1500 "Roman style." This gap is filled by Leonardo's drawings, and for this reason their importance as documentary evidence for the architectural preoccupations of their time cannot be overestimated. The drawings also serve another function. They demonstrate for the first time the basic forms of architectural representation employed during the Renaissance. This includes the exploration of perspective representation of exterior and interior, as well as the fully developed cross section. The use of central perspective as a means of visualizing an architectural composition was perfected by Leonardo to the point of competing with a three-dimensional model.

While the first important section of Leonardo's treatise was intended to deal with proportion and decoration as well as architectural design in urban building, for both sacred and secular structures, the second part was to be devoted to technical problems of construction. For this part as well, Leonardo made intensive preparatory investigations, while individual chapters such as those dealing with the arch and with the causes of structural defects were exhaustively studied. The intended contents of the treatise can be determined with reasonable certainty on the basis of the preserved preliminary studies.

High Renaissance architectural concepts were exemplified in such instruction books as Sebastiano Serlio's treatise, which is an up-to-date version of the traditional pattern book. Leonardo had established the basis for these practical handbooks of building through his development of perspective architectural representation. At the same time, his scientific knowledge enabled him not only to develop a treatise on construction which satisfied all demands of a practical nature but also to make a number of valuable suggestions in the field of statics, which were to be given a systematic exposition only a century later by Galileo in his "Lectures on the Theory of Arches."

Leonardo's artistic and technical gifts were equally reflected in the field of military engineering. His sketchbooks are full of designs for military apparatus of every kind (PL. 118; IV, PL. 268), including various weapons and huge catapults that can be operated by one man despite their enormous size. Equally inventive are his projects for temporary bridges, provisional defensive structures, and offensive scaffolding consisting of easily movable parts that can be rapidly assembled and dismantled. The instructions provided deal with even the smallest details, such as the design of the knots to be used in fastening various parts to one another.

The major part of Leonardo's interest in military engineering was concentrated on the development of firearms (then still a novelty), especially artillery. He designed cannons that can be considered prototypes of the machine gun and other modern firearms. He was active as well in the elaboration of the breech-loading system and the movable gun carriage, which were to improve accuracy in aiming. Leonardo also contributed to the field of ballistics, and the results of his empirical investigations of the trajectory of missiles were applicable not only to artillery but also, and to an even greater extent, to the construction of fortifications. Although his mathematical calculations were inadequate, as a result of his ballistic studies apparently Leonardo became the first person to urge a change from the spherically shaped missile to a conical elongated one able to counteract atmospheric resistance. His designs for such missiles have fins and bear an uncanny resemblance to modern aerial bombs. The significant aspect of these inventions lies in Leonardo's profound insights into problems of ballistics and in the astounding practical application of his theoretical and empirical conclusions, even where the physical premises of his formulations have proved incorrect. This is especially apparent in his designs for fortifications (PL. 118), which show his awareness of new problems facing the military engineer as a result of the introduction of firearms. Aside from the necessary strengthening of the walls, the outstanding feature of Leonardo's defensive structures is the role given to rounded forms. Not only towers but also walls, especially their upper edges, are curved rather than flat and angular in shape. The innovation was an exceptionally intelligent measure intended to minimize the impact of a shot by presenting enemy artillery with an ineffective angle of incidence. Leonardo's ground-hugging forts also were a departure from the tradition of castle fortresses that were high and easily visible from a distance — a farsighted innovation in the light of changing military techniques.

To what extent Leonardo's plans were carried out is not known. The documents connected with his Milanese period show that he was intensively occupied with the fortifications of his patron's city, but the specific accomplishments of this activity can no longer be identified today. It may be assumed that in this branch of architecture, as in others, he functioned primarily in an advisory capacity as a man of considerable reputation. This is shown by his appointment as the chief military engineer and superintendent of fortifications in the service of Cesare Borgia. Leonardo occupied this post for almost a year (1502), traveling throughout the domains of the *condottiere* in Romagna, the Marches, Umbria, and Tuscany in order to inspect his military installations.

In the course of these duties he also executed a series of city plans and topographical maps for Cesare Borgia that greatly enhanced his fame both as a cartographer and as an artist. Having systematically investigated the principles of objective and subjective perspective in his *Treatise on Painting*, Leonardo applied mathematical perspective — and was the first to do so — in cartography, which demands the abstraction of natural vision. Aside from the land-registry maps in common use (schematic plans of entire cities or individual sections of the countryside) or the portolano charts used by mariners, an exact method of cartographic representation was unknown in Leonardo's time. He was apparently first in attempting to combine pictorial and planimetric representation, unifying image and measurement in an important step toward modern cartography. His plan of the city of Imola, which he drew while in the service of Cesare Borgia, is the first city plan to be consistently worked out from an imaginary vantage point. This is no longer the "church-tower perspective" seen in the famous plan of Venice drawn by Jacopo de' Barbari (1500) but a comprehensive view of a landscape. The medieval circular scheme with its division into individual sectors has been retained, but the circle now serves to delimit a real section of landscape as it might be seen from a balloon — a topographical as well as a pictorial entity. In his map of Tuscany, which depicts a watershed primarily, the landscape formation is represented as a flat surface, with elevation shown by gradations of color ranging from the green of the valleys to the dark brown of the mountains. The map would thus fit perfectly into a modern atlas. Another of Leonardo's maps shows a part of Tuscany including Arezzo and Perugia. Mountains and fortified towns are indicated in three dimensions, other elements of the landscape remaining diagrammatic. This method involves a conscious combination of cartographic and pictorial representational devices.

COURT ART. Leonardo produced considerable work as a designer of decorations for courtly festivities. Paolo Giovio called him "a highly admirable inventor and director of theatrical festivals"; many studies for allegorical representations, court festivals, theatrical representations, costumes, and parade weapons show his inventive genius and the variety of tasks of this kind that he frequently set for himself, especially while in the service of the Milanese ruler and at the courts of Louis XII and Francis I. Comprehensive studies, particularly those of Kate T. Steinitz (1961) and Carlo Pedretti (1957), have greatly added to our knowledge of Leonardo as a designer of stage sets and allegories. Of the more restricted studies, one of the most fascinating is Augusto Marinoni's work (1954) on the

rebuses, or pictorial charades, which provide insight into that area of Leonardo's thought where verbal and pictorial concepts combined to produce a rich metaphorical content.

While these genial improvisations of Leonardo's, made for specific occasions, have been lost and can be reconstructed only through his sketches, one project of this type has been preserved — the painted decoration of the Sala delle Asse in the Castello Sforzesco in Milan. Badly disfigured by restoration at the beginning of the 20th century, the decoration partially reemerged after a judicious cleaning. It consists of 16 richly foliated trees with their branches artfully intertwined to form a thick leafy vault. The foliage is threaded with a golden cord forming an over-all, netlike pattern of ornamental knots (*gruppi*), a most ingenious combination of naturalistic and abstract elements. In contemporary north Italian painting, both stylized foliage and this type of knot ornament occur frequently, but only on a modest scale, as in a border or on the throne of a Madonna. Bramante also used such knots in decoration, and Leonardo himself refers in a note to the "gruppi di Bramante" (Cod. Atlanticus, 225r). The famous engravings of knotted ornament bearing the inscription "Academia Leonardi Vincii" were widely known and prized as models. Dürer made woodcut copies of the entire set. The idea of combining these ornamental motifs in such an imaginative manner, however, was Leonardo's.

The trees in the Sala delle Asse are depicted as rooted in a stony ground from which they seem to burst under the impulse of their own vitality. They are a symbol of the transitory, for the same vitality which brought this artificial bower into being will be the agent of its inevitable destruction. The decorative concept of the Sala is thus not without certain tragic as well as historical implications. This is the first representation of a theme which became central to mannerism — the conflict between natural and artistic form, which was given full expression in the rustic architectural style of the period and in paintings such as those of Giulio Romano in the Palazzo del Te in Mantua. The theme continued on into the work of Buontalenti and, in its theoretical form, appeared in the writings of Vasari and Serlio and finally was expanded in the *Iconologia* of Cesare Ripa.

Scientific works. Leonardo's scientific work must be discussed as the accomplishment of an artist. He regarded himself primarily as an artist, and it was through art that he came into contact with science. Leonardo's first comprehensive task which brought together art and science was the *Treatise on Painting*. In the form in which it is presently known, this famous book is not an original work of the master but a compilation based on various manuscripts by Leonardo, made under the supervision of his student and heir, Francesco Melzi, about the middle of the 16th century. The manuscript copy of Melzi's work is preserved in the Vatican Library (Cod. Urbinas lat. 1270). Thus while the contents of Melzi's compilations are taken faithfully from Leonardo's notebooks, the sequence of the subjects was not established by the artist. In addition, this compilation by no means includes all of the numerous comments on painting found in Leonardo's original manuscripts.

The plan of the treatise as Leonardo intended it can be approximately inferred from literary sources and personal remarks of the master. It would have been composed of two principal parts dealing respectively with the theory and practice of painting. The theoretical part was to have dealt with perspective under the subheadings of linear, color, and aerial perspective. A chapter on light and shade was to have followed, presumably with a section on color theory, which is twice explicitly mentioned by Leonardo. The second part of the treatise, elaborating the practical aspects of painting, would have dealt with drawing and color, to be followed by large sections devoted to the human figure (proportion and anatomy) and its motion (physical and spiritual). Both parts of the work would have included rules and advice on composition, as in the earlier treatise of Alberti. These principles concerning the representation of man were to be followed by a discussion of the representation of nature. In this context Leonardo planned to deal with problems in the rendering of cosmic forces, the atmosphere, clouds, water, air, wind, and the structure of the earth and plants. Corresponding to the plan of earlier treatises, Leonardo's work might have been introduced by a comprehensive statement on the meaning of art and an attempt to define its relative significance in the form of a *paragone*, by which it was customary to compare the merits of painting with those of poetry, music, and sculpture. Whether his *precetti* were to have followed directly after the introduction, as in the Codex Urbinas, or to have been relegated to the conclusion, as in Alberti's treatise, is not known but is of no critical importance.

Available sources do not make it possible to define the overall plan of Leonardo's intended treatise with greater precision. He had not himself, in any case, arrived at a final formulation of the work. This is shown by an analysis of the sequence of his notes for the project, as far as it can be determined in the original manuscripts. These notes stretch from the year 1490 until at least 1513, and thus over much of the artist's career. Just as Leonardo's scientific studies changed considerably during these years, so the treatise as Leonardo intended it toward the end of his life differed considerably from the scheme he had developed as a young man. The earlier plan is reflected in rough form in Manuscript 2038 in Paris (Inst. de France), and considerably later plans for the arrangement of the treatise are recorded in Manuscripts E and G (Paris, Inst. de France), probably conceived between 1510 and 1513.

The treatise should therefore be analyzed chronologically as well as for content. In the light of Leonardo's attempts to give his later theories a broader scope than was developed in earlier treatises, his relationship to the intellectual tradition of late Scholasticism must be considered, especially the concepts of order and value. The *paragone* was written about 1490, at a time when Leonardo's concepts were still in the formative stage. The *precetti* were also for the most part formulated early in his career, in so far as they were concerned with concepts of a general and didactic nature. In later years these principles were altered to some extent, and a more subtle distinction was made between practice and theory. The section dealing with anatomy is the result of considerable experience acquired over a long period of time through persistent study. Leonardo's anatomy lessons for the painter are not contained in the excerpts of the Codex Urbinas and must be reconstructed on the basis of the original manuscripts. His notes and drawings on the subject extended over his entire career, developing, as in the other parts of the treatise, from the purely descriptive to the broader issues of concept and meaning.

Leonardo's treatment of nature as it has been transmitted in the Codex Urbinas is confined to a number of sketchy passages. This section, which was to have dealt with cosmology from the viewpoint of the problems confronting the painter, must therefore also be culled from the original manuscripts.

Leonardo's practical application of his theories was determined by his conviction that by means of his *saper vedere* he must not only express the laws of nature in abstract terms but must also present them concretely. These demands on his sensory and intuitive capacities forced Leonardo to expand his work beyond the bounds of the traditional treatise on painting and led to a veritable encyclopedia of form and representation. One of the most significant aspects of Leonardo's method of exposition was the development of a dynamic and intimate relationship between word and picture, probably meant to be even more closely integrated than the Codex Urbinas would suggest. This is an innovation in art education which has been almost entirely overlooked. A large number of Leonardo's sketches can with certainty, often through the Codex Urbinas, be accepted as illustrations intended for the treatise on painting and can be clearly differentiated both from Leonardo's purely artistic sketches and from specific scientific projects. In the treatise drawings, especially in those of the late years, the two purposes of art and science are inseparable, further indicating how in this work Leonardo's interests are united. The dual allegiance of the treatise is all the more remarkable, considering that the work was created at a time when science and art were both bidding for the claim to greater objectivity.

Mathematics, optics, and mechanics. If there is one unifying principle in the great mass of notes and drawings left by Leonardo, it would seem to be an intention on his part to create nothing less than an encyclopedic exposition of human knowledge. Such an encyclopedia would have included optics as the necessary basis for correct perception, mechanics as the study of the physical forces within organic and inorganic nature, and biology as the study of growth and life, with anatomy as its central theme, and cosmology as the study of the forms and energy active in the universe. Leonardo believed himself qualified to undertake this gigantic task through his education as an artist. Only the artist, he believed, is endowed with *saper vedere*, owing to his dual ability to perceive reality and to transmit his perceptions to others.

"Let no one who is not a mathematician read my work," Leonardo wrote on one of his anatomical studies (Windsor, Royal Lib., 19118v). This statement, which Leonardo presumably meant to elaborate upon in the preface to his treatise on anatomy, must be properly interpreted: Leonardo was not a mathematician in the ordinary sense of the word. He considered mathematics to be the only science equipped with its own means of verification, to be the basis of all scientific thought; he accepted it as the logical foundation of perception. But Leonardo's activity as a mathematician was limited to the consideration of practical problems of a purely objective nature. He hardly concerned himself with arithmetic and concentrated for the most part on geometry, where his interest ranged from the Euclidian theorems to playful speculation. Already in Milan in 1494–98 he had set down in two notebooks the principal propositions of geometry that constituted the fundamentals of perspective for the art of that period and, therefore, the scientific foundation of painting. His main adviser in these matters had been Luca Pacioli, for whose *De divina proportione*, completed in Milan in 1497, Leonardo had provided illustrations. He may also have met mathematicians during his later travels to such places as Urbino.

Pacioli may also have interested Leonardo in the *ludi matematici*, the half-serious, half-playful exercises in mathematical speculation which the Renaissance had taken over from antiquity. These exercises involved problems of applied mathematics primarily: surveying and arithmetical puzzles, geometric combinations of simple ornamental constructions, matters relating to regular surfaces and bodies, the so-called "transformations," the squaring of curved planes, and the cubing of spheroids. Leonardo's manuscripts are full of such exercises. In the later years of his life he composed a work entitled *De ludo geometrico*, which was completed, according to a note, in Rome on July 7, 1514. There Leonardo manifested the same predilection for proportioning and geometric centering that is a dominant element of his artistic compositions. These mathematical fantasies, as they can be called, are the basis not only of much of Leonardo's ornamentation but also of his centralized ground plans, which are freely conceived as geometric configurations rather than constructions in response to specific practical demands. In Leonardo's painting, compositions such as *The Adoration of the Magi* (PL. 117) and, to an even greater extent, *The Battle of Anghiari* are based on geometric principles of organization, the general relationship of parts being governed largely by mathematical considerations.

Mathematical principles played a central role in the artistic theory of the time. Pacioli had divided mathematics into three parts — arithmetic, geometry, and proportion — and this was the conception held by Leonardo. In mathematics Leonardo saw a combination of logic and imagination, of abstract and concrete speculation, which could serve as a bridge between artistic and scientific preoccupations. This type of intuitive mathematical thinking was of constant assistance to him in problems of method and verification. He saw the principles of geometry and proportion as the starting point of every branch of science, as the regulator of nature manifest in the symmetrical structure of plants, sediment, whirlpools, and whirlwinds. All of Leonardo's studies in optics, mechanics, biology, and cosmology are based on this understanding of mathematics. Only through mathematics was he able to formulate the hidden laws of cosmic harmony that played such an important role in his thinking as both artist and scientist. "Proportion," he wrote, "is not only found in numbers and measurements but also in sounds, weights, time, and position, and whatsoever power there may be" (Paris, Inst. de France, Ms. K, 49r).

Of Leonardo's projected work on optical theory, only fragmentary preparatory studies are preserved, but even these show the dedication with which he pursued this inquiry, which was to constitute the foundation of his concept of cognition, just as his theory of vision formed the basis of his concept of art. His theory of vision held that the sense of sight was the most reliable instrument of perception, and in his study of optics he sought to prove this in mathematical terms. Beginning with artistic problems bearing on aerial and color perspective, treated in detail in the *Treatise on Painting*, Leonardo made intensive studies in the field of optical theory. He systematically investigated the formation of shadows in the presence of simple or multiple sources of light and developed a method for measuring the intensity of light (Paris, Inst. de France, Ms. C, 22r). He was aware of the reversal of the image in the human eye and had also arrived at the principle of the camera obscura. His observations on optics are startling. He was fully cognizant of the reflection, refraction, and diffraction of light rays, and even the phenomena of interference and irradiation were familiar to him. He analyzed the spectrum and knew that the kaleidoscopic effects of color in bird feathers, iridescent glass, and oil slicks were caused by the refraction of light. He made a precise description of the diffraction of light around a candle flame, even though his explanation of this phenomenon proved incorrect. He accurately explained the glimmer of starlight as a natural consequence of the mechanism of vision reacting to the circular diffusion of light and thus recognized the interference principle of light rays.

Leonardo's achievement in the field of optics lies more in the discovery of specific natural phenomena than in their explanation. His contribution was made possible by singular powers of perception. Leonardo observed with the naked eye phenomena that even today can be detected only with the help of instruments and with a certain amount of effort. He did not approach nature as a methodically trained scholar but with a great thirst for knowledge that led him to perform countless experiments; lacking a logically consistent procedure, these experiments did not lead to theoretically conclusive results.

Leonardo's studies in mechanics also depended on observation primarily and were based largely on his powers of perception and his ability to present his perceptions in an objective representational form. Here again Leonardo's artistic activity was the point of departure for his interest in a particular branch of science, and his concern with mechanics only gradually developed into a preoccupation for its own sake. To understand this development one must separate Leonardo's interest in mechanics as an engineer and as a theoretician. Until old age, Leonardo remained a brilliantly inventive engineer. His sketchbooks, full of technical studies, show that he was a master of applied mechanics. Models constructed on the basis of his drawings, for the great Leonardo exhibition in Milan in 1939, proved that many of his ideas were thoroughly practical and could be fully realized. Most of Leonardo's drawings of machines — in contrast to earlier, contemporaneous, and, in some cases, later graphic representations of mechanical devices by others — could easily be translated into working models. This is a result not only of their clarity as drawings but also of the application of correct mechanical principles, often merely through intuition.

The historical importance of Leonardo as an inventor, however, stems less from his innumerable designs than from his fundamentally new approach to the machine as a mechanical organism. This new attitude arose in the process of developing a scientific, experimental method based on an orderly progression from practice to theory and on the formulation of general principles as a step beyond the observation of individual phenomena. Leonardo subjected the most varied aspects of mechanics to a precise analysis. On one of the sheets of the Codex Atlanticus, for example, the principal types of cogwheels and threads

are drawn side by side; on another, calculations concerning the operation of pulleys are entered. It would appear that Leonardo had intended to compose a compendium of elements of the machine, which would have served as a guide in all types of endeavors connected with construction; such a guide would indeed have been an unprecedented achievement.

All of Leonardo's studies on construction show a common concern with the operation of mechanical forces, a concern which over the years came more and more to the fore. His principal interest, despite great competence as an engineer, was in theoretical rather than applied mechanics. (The material on mechanics was collected and annotated by Arturo Uccelli, 1940.) "Mechanics," Leonardo wrote, "is the paradise of the mathematical sciences because by means of it one comes to the fruits of mathematics" (Paris, Inst. de France, Ms. E, 8v). As the theory of the forces active within nature, mechanics became the focus of his investigations into the laws that govern the universe.

Leonardo had considered bringing together his studies on applied and theoretical mechanics in one large work, and often referred to ideas elaborated in his *Libro del peso*. He was aware of most of the available literature on this subject and stated his position in regard to the two major schools of scientific thought of his day — the dominant qualitative or philosophic doctrines of late Scholasticism and the quantitative and experimental ones of the school of Jordanus Nemorarius: Leonardo was essentially predisposed toward the latter, but being skeptically inclined and self-trained, he jealously guarded his independence and remained aloof from all factions.

Leonardo's experimental method applied to mechanics was also based exclusively on the concept of *saper vedere*. His keen observation permitted him to record the most trifling occurrences in nature, which were then tested through comparison with other material and ultimately visually demonstrated by graphic means. There exist an enormous number of drawings and calculations concerning the lever, the scale, the inclined plane, friction and resistance, and the principle of virtual velocities. Often the same problem is repeated in endless variations, and it seems unclear whether Leonardo had arrived at any logical conclusion. As a rule he was content to demonstrate a particular phenomenon and did not feel compelled to elaborate on its general theoretical implications. When he did formulate concepts of statics and kinetics, he was able to recognize their validity within the total realm of nature. The conformity of natural laws to one principle of order never failed to evoke his wonder. Leonardo expressed this in his famous concept of force (Paris, Inst. de France, Ms. A, 34v), which, although it does not provide a theoretical definition of force, was for the time a significant statement and provides insight into the philosophy of science of this "omo sanza lettere."

Anatomy and physiology. "Arrange it so that the book of the elements of mechanics with examples shall precede the demonstration of the movement and force of man and of the other animals, and by means of these you will be able to prove all your propositions" (Windsor, Royal Lib., Anatomical Ms. A, 10r). These words, written between 1510 and 1513, express the natural connection between Leonardo's views on mechanics and anatomy and, at the same time, point to the new direction which his studies in biology were to take. Leonardo's investigation of anatomy grew out of the practical knowledge of this science common among artists of the period. His earliest drawings, which can be dated in the 1480s, are characterized by an earnest effort to master the structure of the human body, a goal which he was to establish in his *Treatise on Painting* as an important requirement in the training of artists. But apparently the medical practices of his time soon made Leonardo skeptical about the anatomical knowledge available and led to an interest in the subject that was to make him a truly fanatical student of anatomy. In 1498 he composed a plan for a comprehensive treatise on anatomy (Windsor, Royal Lib., Anatomical Ms. B, 20v). In this project the thirty-seven-year-old Leonardo proposed for himself the task of a lifetime: Proportion, physiology, physiognomy, and psychology; these

themes, which would absorb his interest throughout his artistic career, were to be dealt with as autonomous subjects of investigation. The mere fact that Leonardo considered anatomy in such a broad sense, embracing the principles of growth of the organism and the study of the mechanism of life itself, raises his efforts far above the scientific concerns of his contemporaries.

Leonardo had to provide his own tools of investigation. According to his testimony he dissected 30 cadavers, an astoundingly high number at that time. He had to improvise entirely new means of representation; contemporaneous scientific practice and literature were of no help. Thus Leonardo's investigations were conducted in two directions simultaneously: toward the intuitive perception of phenomena and toward the discovery of means to illustrate that which is known. To a much greater degree than in his studies on mechanics, Leonardo's aims in the field of anatomy were directed toward the perfection of the image as a carrier of information capable not only of supplementing the written word but also of supplanting it. He felt impelled to place his skill in the service of science and truth and clearly expressed this view in a passage written about 1507, intended for the preface of his anatomical studies (Windsor, Royal Lib., Quaderni d'Anatomia, I, 2r, 13v).

The bulk of Leonardo's anatomical studies (PL. 118; IV, PL. 268) can be distributed within three periods of his life, each representing a stage in his development. One group of notes and drawings was produced in the Milanese period of 1490–1500; another can be attributed to his 1502–07 stay in Florence; a third can be placed in Milan and Rome in the period of 1508–15. In Rome his anatomy studies were interrupted when Pope Leo X, on the basis of slander, denied him access to the death chamber of the Ospedale di Sto Spirito. Yet Leonardo did not fully abandon his studies; until his death he continued to work on his great anatomy treatise.

The early anatomical studies dealt principally with the skeletal frame and musculature. Already in these works there appeared a new type of anatomical representation based upon a scientific method of demonstration. Later the mechanics of the body became the major concern of these studies. That a purely artistic problem was sometimes the stimulus for scientific inquiry is shown in the preparatory drawings for *The Battle of Anghiari*: one study for a fighting man is unexpectedly accompanied by a precise analysis of the function of the shoulder muscles (Windsor, Royal Lib., 12640). Many beautiful examples among Leonardo's analytical drawings show how the same problem was handled (Windsor, 19003v). In these drawings the graphic requirements for scientific illustration are fully developed, including various typical sections, the simplification of forms carried almost to conscious stylization, and representation of the three-dimensional body in full transparency. Leonardo developed these principles in a group of written instruction sheets. While the rules deal only with the principles of scientific illustration, the drawings themselves not only realize these rules but also exhibit Leonardo's artistic genius, which is of primary importance in his anatomical studies.

Leonardo's interest in the life processes of man led him to give special attention to the internal organs, especially the lungs and heart. In a number of fine drawings he recorded the lungs with the bronchial tubes, the larynx, the throat, the soft palate, the windpipe, and the gullet. He minutely investigated the process of vocal production and modulation and the musculature of the tongue and lips. A drawing of the lip muscles (Windsor, Royal Lib., Anatomical Ms. B, 38v) recalls those studies, previously mentioned, comparing the expressions of man and beast. Actually, Leonardo's late drawings of skeletal and muscular anatomy would appear to the true anatomist to be riddled with errors, as in the representation of the spine in one of his last anatomical sketches (Windsor, Royal Lib., 19075v). The apparent inaccuracy, however, was intentional and motivated by Leonardo's desire to represent the muscular system so that the head appears to be supported by the spinal column "like a mast by its rigging." In order to make this comparison clear, Leonardo deliberately represented the trapezius as a series of individual cords, although he had often represented it in its normal

form. He was certainly also aware that the muscles are attached to the shoulder blade proper and not to its upper edge. This schematization also must have been suggested by the comparison with the mast. He was not concerned here with the correct representation of anatomical form but rather with the illustration of a mechanical principle and thus was willing to sacrifice accuracy in favor of meaningful stylization. This is a characteristic aspect of what might be called his "speculative physiology," although in his hydraulic and aerological studies, as well as in the purely artistic creations of his last years, similar tendencies may be observed. In his late anatomical studies Leonardo remained faithful to his basic ideal, the visual representation of the forces operative in the organism. This is shown in his treatment of the problems of respiration and movement of the blood and to an even greater degree in his embryological studies, which led him close to the mystery of generation. His analysis of the reproductive organs reflects the keen precision of his powers of observation, even though several errors may be found in his representations. Thus in his famous drawing of the uterus (Windsor, Royal Lib., 19102r) he was led by an erroneous process of analogy to show the cotyledons of the placenta as they appear in the cow, not as they exist in the human female. The position of the embryo and the placement of the umbilical cord, however, are rendered with such accuracy and excellence that this drawing is still found in medical textbooks.

The value of Leonardo's anatomical studies lies in the keenness of his observation and the force of his imagination. When his powers of perception could not be put to use, however, Leonardo's conclusions suffered. His failure to recognize the circulation of the blood, although he had correctly understood nearly all the individual phenomena connected with it, is a prime example of the limitations of his method.

In about 1507 Leonardo came in contact with the Pavian doctor Marc' Antonio della Torre. The close collaboration with this distinguished man was highly rewarding, and through him Leonardo had the opportunity to acquaint himself with the best that contemporary medicine had to offer. In addition to the art of dissection and experimentation on living subjects, he was able to familiarize himself with the current terminology of medicine, much of which went back to Galen.

Zoology and botany. Apart from his general pictorial studies after nature, Leonardo's zoological interests fall mainly within the framework of comparative anatomy. Only two subjects within this area interested him seriously, each for very different reasons: the anatomy of the horse and the flight of birds. It is known from various sources that Leonardo composed a work on the anatomy of the horse, but it is no longer possible to reconstruct its scheme. The work was known to both Dürer and Rubens, probably through copies of individual sheets which must have been widely circulated (cf. New York, Pierpont Morgan Lib., Cod. Huygens, in part derived from Leonardo's work; XI, PL. 348). Today the only remaining evidence for the existence of this work is a number of splendid drawings, for the most part in the Royal Library at Windsor.

The artist's studies on the flight of birds continued throughout his life. At the time that the thirty-year-old Leonardo was offering his numerous inventions and engineering designs to the Duke of Milan, he must have formulated the idea of constructing a flying machine. The early sketches and notations for this project largely concern the adaptation of the principle of the bird wing to human flight. In his anatomical investigations Leonardo identified two principal parts in the structure of the wing: the concave underside, to which he attributed the load-bearing function, and the upper, convex surface, which he associated with motion. He intended to apply these findings in the construction of his flying machine (Milan, Ambrosiana, Cod. Atlanticus, 276, 311). On the evidence of the many surviving drawings the flying devices that Leonardo developed in his Milanese period can be divided into two types. In the first, the flier was strapped in a horizontal position and the flying mechanism was activated by swimming motions made with his hands and feet. In the second, he stood erect and with his hands and feet operated a complicated crank mechanism that reproduced the motion of wings in flight. Both types were unworkable, owing primarily to the great disproportion between the weight of the flier and the amount of motor power he could generate solely by means of muscular exertion. The experiments have great historical value, however, for Leonardo's methodological premises were based on fundamentally sound assumptions concerning the nature of air and its resistance. An indication of Leonardo's clear thinking is that he himself discovered the critical flaw in his invention and sought to rebuild his theory of human flight on an entirely new foundation. The Codice sul Volo degli Uccelli ("Codex on the Flight of Birds," Turin, Bib. Reale), written in Florence about 1500–05, is worked out with systematic clarity. Beginning with the consideration that a heavy body can be maintained in a floating state through aerial resistance, Leonardo studied the motion of birds' wings in windy and calm atmospheric conditions. He analyzed the process of flight itself: gliding flight; motion forward in straight, inclined, and curved patterns; climbing and descent; slowing down in flight and when landing. Through his investigation of the complex mechanical problems associated with flight, Leonardo gained insight into the characteristics of atmospheric behavior, which he later incorporated in his more general consideration of aerological and hydraulic problems. These studies were to be the basis of his cosmology, his study of inorganic nature. When in the last years of his life, about 1513, he once more turned his attention to the flight of birds, he was motivated to do so by purely physical problems. His primary interest at this later point was in the characteristics of air (Paris, Inst. de France, Ms. E). Thus Leonardo's interest in flight passed through the same phases evident in his other work — from the systematic exploration of a problem, to the theoretical analysis of the data gathered, to the practical application of derived principles, and ultimately to the formulation of a comprehensive, speculative theory.

Leonardo's interest was led to the field of botany (PL. 118; IV, PL. 268), as it was to anatomy, through the mediation of painting. In his early paintings and drawings he had exhibited a special fondness for the plant world. At about the age of thirty he had begun to collect plants and was making drawings and wax impressions of leaves in order to study their skeletal structures. From external appearance he proceeded to an analysis of form and organic structure. He was able to make a number of fundamental discoveries which are still valid today, and his work is considered of such importance that he has been designated the founder of the science of botany. Since antiquity the study of plants had been largely the domain of pharmacology and magic, and the sole concern had been with their useful or harmful qualities. Leonardo was the first to conceive of botany as an autonomous biological science. A sheet of studies in the Accademia in Venice, admirably delicate and precisely rendered, is perhaps the earliest example of scientific botanical illustration, even though it was certainly executed as a study of artistic motifs. Leonardo's later drawings reflect his profound understanding of the nature of the plant organism. In his study of a star-of-Bethlehem at Windsor Castle (12424), the living growth of the plant has been beautifully expressed, while the Windsor drawing of the Cyperaceae (12427) could easily be used as an illustration in a modern textbook.

Cosmology and other physical sciences. Many of Leonardo's commissions stimulated his interest in the problems of inorganic nature. In the practice of his craft as a painter, as a military engineer and cartographer, and especially as a hydraulic engineer, he was forced to face these problems. In the course of his studies, however, his interest developed into the independent pursuit of geology. Through a concern with the shape of the earth's surface he gained an insight into its structure. His singularly well-developed powers of observation led him to formulate conclusions which, in this field too, were remarkable for his time and are still to a large extent valid today. According to his own word, he became preoccupied with geological questions as early as his work on the Sforza monument (i.e., before 1500). His notes on the properties of water, which he consigned to a large manuscript (Cod. Leicester, ca. 1500–04, Norfolk, Holkham

Hall, Earl of Leicester Coll.) and to various notebooks (Paris, Inst. de France, Mss. E and F; Milan, Ambrosiana, Cod. Atlanticus), were in large part written only after 1500. In close relation with aerological studies, this interest extended to the end of his life.

Through his own efforts to discover the true origin of fossils, based on the theories of Albert von Helmstedt, Leonardo was able to arrive at a highly precise explanation of various forms of sedimentation. The study of fossils apparently made him conscious of the infinite span of time and of time's all-consuming power. When, however, he believed his own means of perception to be exhausted, he fell back on traditional theories. For a relatively long time he attempted to base his explanation of the behavior of terrestrial bodies on inferences drawn from the observation of the human body. Thus he adhered to the macrocosm-microcosm theory that had been formulated in antiquity, transmitted by the Middle Ages, and ultimately taken over by Renaissance philosophy, especially in the work of Nicholas of Cusa. Similarly Leonardo drew on the theories of ancient writers and commentators to help him formulate a general theory of the earth's origin based on his discoveries in connection with fossils. When he was in a position to make direct geological observations, however, as in studying the Italian peninsula, his opinions became more realistic. In Tuscany Leonardo made a thorough survey of the valley of the Arno and the Apennine chain, and while in Milan he investigated the valley of the Po and the Alpine region.

Observing the broad area watered by the Po, the Alpine rivers and streams, the snow-covered peaks of the great mountains (he had been the first to climb far above the snow line on Monte Rosa), everywhere he saw evidence that water is the dominant force of nature. "Water is nature's carter," he once wrote (Paris, Inst. de France, Ms. K, 2r), and to the study of water he devoted himself tirelessly. While in his geological pursuits Leonardo attempted to grasp the static form of the earth, the aim of his study of water was to seek out its dynamic forces. In Milan Leonardo had the opportunity to learn much that was new from the Lombards, who since ancient times were known for their skill in engineering. His notebooks record the names of many hydraulic engineers from whose practical and theoretical experience he profited. As an independent technician Leonardo first appears in connection with a project that was being considered by the Florentine Signoria between 1502 and 1504, when Leonardo was technical advisor for the Florentines. The project, previously mentioned, was aimed at cutting off the beleaguered city of Pisa from access to the sea. Leonardo's bold plan to divert the waters of the Arno into canals was abandoned because it held no prospect of quick military success. But from this military scheme grew the more productive idea of making the Arno navigable and at the same time opening up large stretches of reclaimed land for agricultural purposes (Cod. Atlanticus, 46r-b). Leonardo's notes and cartographic sketches indicate the farsightedness that characterized his efforts in hydraulic engineering and land reclamation.

A more practical scheme occupied Leonardo during his second Milanese stay — that of making the Adda River navigable in order to connect Milan and Lake Como by a direct waterway (Windsor, Royal Lib., 12399; Cod. Atlanticus, 141v-b). During his stay in Rome Leonardo became involved with a project for reclaiming the Pontine Marshes that was begun in 1515 by Giovanni Scotti da Como, a north Italian. In France Leonardo elaborated a plan for the drainage of the marshes in the Sologne region for Francis I, to make land available for the castle and gardens that the King intended to build at Romorantin (London, Br. Mus., Cod. Arundel, 263, 270v).

The significance of these hydraulic projects lies less in their technical achievement, which can often no longer be defined in detail, than in their theoretical foundation, all the more admirable for having been developed on the basis of personal observation and experience. Leonardo's notes indicate that he intended to write a comprehensive treatise on the nature and characteristics of water, and individual studies from the 1490s as well as the later work in the Codex Leicester bear out this intention. On one of the first leaves of the Codex Leicester he outlined

his work as follows: "These books contain in their first part, of the nature of water itself in its motions; the others treat of the effects of its currents, which change the world in its center and shape" (5r). During the 17th century an anthology of his notes was made in an attempt to reconstruct a treatise on the nature of water, after the model of the *Treatise on Painting*. Repeatedly reprinted, this work included only incomplete parts of the extant material in the original manuscripts. The organization of the work also did not conform to what appears to have been Leonardo's far more ambitious outline.

As always, Leonardo separated the concepts of substance and function. In numerous experiments he analyzed water as matter, characterizing it as a flowing mass incapable of either altering its basic substance or of engendering its own motion. He was then led to differentiate the two states of motion that water might exhibit as a result of external conditions: stationary and progressive. The principal subject of his hydromechanical studies was the investigation of the forward motion of water and the principles of its flow. Leonardo was especially fascinated by the movements of eddies, which stirred his artistic sense by their beauty and organization; through them he became conscious of the great variety of effects produced by the behavior of mechanical forces. Leonardo was able to depict clearly the complicated optical phenomenon presented by the swirling vortex (Windsor, Royal Lib., 12680), and his studies of eddies are among his most impressive works of graphic demonstration. In both scientific and purely artistic terms, these drawings are a vivid testimony of Leonardo's remarkable powers of analytical and synthetic observation (Windsor, Royal Lib., 12660v).

In order to assess these drawings properly it is necessary to grasp the intellectual process by which they came into being. Even more remarkable than Leonardo's brilliance in unraveling the complex structure of eddies is his ability to give a clear account of both the formal characteristics and the functional properties of such a piece of "water sculpture." For Leonardo's drawing clarifies not only this fascinating play of forms but also the dynamics of the interplay of forces present in the constantly moving, yet basically unchanging, liquid body.

As in the case of his anatomical and biological studies, Leonardo's investigations of water show the combination of artistic and scientific thinking that characterizes his work. The method of graphic representation exhibited in his drawing of the eddy depends on the same principles followed in his late anatomical drawings — transparency and formal stylization. The conscious schematization by which a simultaneous analytic and synthetic visualization is achieved serves both an artistic and a scientific end. The eddy depicted as an ornament composed of lines of force is intended to express the harmony of form and of function as the effect of natural law.

New considerations growing out of his investigations of water led to Leonardo's return to the study of birds during his later years. He now began to study the air as a medium and bearer of cosmic energy. Leonardo observed that air, in contrast to water, is markedly compressible and expandable and that its density decreases in proportion to its distance from the ground. He devoted special attention to the whirling motion of the wind, its course, and its various forms. He noted that whirling currents and the conditions that produce them occur most frequently in mountainous regions. He compared these natural phenomena with certain similar characteristics in whirlpools. Leonardo had also observed that birds make use of upward currents to keep themselves aloft with a minimum of effort. A late drawing (Paris, Inst. de France, Ms. E, 23v) demonstrates this point in an interesting way: The waves breaking against the cliff stand not only for water but also for air currents, whose direction of motion is used to advantage by the gulls in landing and taking off. The invisible lines of force of the wind currents are thus graphically rendered in much the same way as the currents of water. This sketch shows a method of draftsmanship which is important in Leonardo's last graphic works — that of materializing invisible cosmic forces in the elements in which they operate.

Leonardo was over sixty when he began his final study of the principles of water and air currents. Between 1513

and 1517 he was intensely preoccupied with these problems and instituted various experiments shortly before his death. The conclusions drawn from these experiments moved Leonardo to work on a visual and visionary representation of the ultimate resolution of the forces active in the universe. What emerged was a series of drawings in black chalk called the *Deluge* drawings; they were not intended to represent the Biblical flood but rather the end of the world.

The technique that Leonardo had already employed for the generalized representation of material substances in his scientific illustrations and in his demonstration of upward air currents appears in the *Deluge* drawings as a wholly distinctive method of representation. Through a process of stylization the various materials in nature — stone, water, clouds, air — are rendered virtually undistinguishable from one another and are thus reduced to their common material denominator. Invisible cosmic forces manifest themselves in the substances which they, the forces, motivate, compelling these substances to assume the forms in which they in turn act as prime movers according to fundamental mechanical laws. Thus the basic forces and functions of the cosmos are revealed through the basic cosmic substances. Leonardo's *Deluge* drawings are symbols of these basic forces in their final resolution, destroying what they themselves have brought into being, yet destined even in the final destruction of the universe to conform to the principles of order and harmony. The ultimate conclusions which Leonardo formulated as a scientist were thereby given expression in artistic terms, revealing again the indissoluble bond between his scientific and artistic inclinations.

With this synthesis of scientific reason and artistic imagination, Leonardo pushed to the fullest his powers of visual suggestion. How deeply he was aware of human limitation is reflected in his statement: "Nature is full of infinite causes which were never set forth in experience" (Paris, Inst. de France, Ms. I, 18r). Until the last moments of his life Leonardo remained secure in his belief in the existence of a universal harmony governing all forms and forces, all time and space, which would manifest itself even in the apparent chaos of the end of the world. He sought to discover this harmony in the phenomena which came into the range of his spirit and to bring it into all his own creations through the medium of his art.

Ludwig H. Heydenreich

Leonardo's thought. To attempt to derive an organic vision of life and reality, or indeed a systematic philosophy, from Leonardo's writings would be to misunderstand his work profoundly. His fragments do not constitute a philosophy in the technical sense. Nothing could be more mistaken than the effort that has at times been made to compare them to fragments of the writings of the Greek pre-Socratic philosophers — which are, in fact, scattered remains of what once were integrated works arranged to present a total vision of reality. Leonardo's literary remains are merely hasty notes on technique and construction, artistic memoranda, maxims and aphorisms, and notebooks with words and phrases that interested him. Rational chains of argument and the foundations provided by consciously elaborated principles — the very sinews of philosophy — are missing.

Leonardo's scanty knowledge of Latin precluded direct access to the scientific work of his contemporaries. He was informed on matters that were debated and discussed, but the books he consulted were compilations, often out of date and mediocre in quality — Pliny in the vernacular translation of Landino, Ramusio's *Valturio*, Cecco d'Ascoli's *L'Acerba*, Brunetto Latini's *Trésor*. But this apparent limitation constitutes his strength. Leonardo's lack of access to traditional expositions freed him from the dead weight of a passive inheritance to which he reacted with disdain and scorn. The culture of the universities, the Scholastic tradition, the circumscribed research of the natural scientists as well as the theologians, belonged to a different world; the small part of it that filtered through to Leonardo in vernacular translations and in conversations served to stimulate his curiosity without stifling his originality, even though the gulf between his method of inquiry and the method of the world in which he lived left his efforts without an echo. The more one studies his manuscripts, the more it becomes apparent that Leonardo had only slight cognizance of classic and late medieval science, and this was derived from minor or popular works, public debates, and discussions among the learned and in artists' workshops in such centers of rapid dissemination of ideas as Florence. His many remarks based on a name, a secondhand reference, a word, or a trite question are hardly informative. When not anachronistic, they at most reveal a horizontal culture, a background of problems and doctrines. Leonardo's work cannot be identified with any circumscribed trend, be it Platonism, Cusanism (the philosophy of Nicholas of Cusa), Parisian physical science, or Aristotelianism; one finds throughout his notes an indifference to coordinated, unified argument capable of reconciling differences and contradictions. Yet his thought, which remains perhaps his greatest innovation, is nonetheless based on certain specific points; these form the sole basis for an attempt to isolate his first principles.

The Ariadne's thread that may serve as a guide among so many scattered riches is the constancy of the method imposed on the investigation — a new classification, so to speak, of the arts and their reciprocal connections. Thus one must consider the revolt, common at the time but nonetheless important, against the "authors," against knowledge based on the commentary of a book: "the authors, who by employing only their imagination, wished to make themselves interpreters between man and nature" (Paris, Inst. de France, Ms. I, 102r and v). That Leonardo, in his disdain of "letters," sought to reject the world of the 15th-century Humanists has been often repeated; but it has been less commonly observed that his rejection struck primarily at a science of nature which was largely limited to annotating Aristotle and which insisted on the interposition of an authoritative text "between man and nature." Leonardo wanted to eliminate the concept according to which the only "scientific knowledge is that . . . which is born and ends in the mind."

The collection that constitutes the *Treatise on Painting* contains some of the most significant strictures against "the lying sciences of the mind," while the principles of certainty are outlined with precision. For Leonardo the condition of knowledge was the circle from experience to experience, by way of the mind and reason. Leonardo's power and originality reside not in the insistent demand that there be a recourse to sense experience — that is nothing new — but rather in the criticism of the mental sciences and in the method of apprehending the integration of the mind and senses and the integration of experience and mechanical operations. He declared that "those sciences are vain which have not passed through the senses," that "experience [is] the mother of all certainty," and that the investigation into "things which cannot be tested by the senses [such as] the nature of God and of the soul or similar things" is destined to remain subject to perpetual dispute and contention. ("Where reason is wanting, men cry out against each other, which does not happen with certainties.") Thus emerges a clear criterion for discriminating between the spheres of contention and scientific certainty. The "eternal silence" which follows the mathematical proof is contrasted to the eternal clamor of the philosophers. "Where one disputes there is no true science; because the truth has one single end, which being published, argument is destroyed forever" (*Trattato della pittura*, ed. Borzelli, 1924, par. 29; Windsor, Royal Lib., Quaderni d'Anatomia, II, 14r).

The result is a reshuffling in Leonardo's records of the customary hierarchy of disciplines. Those which, precisely because of their separation from the perceivable, held the higher position in the Renaissance view are simply dismissed with an elementary principle: Where the "dispute" is not eliminated either by demonstrable mathematics or by experiment, there is nothing but sophism. "The true sciences are those which have been penetrated by the senses, so that the tongues of argument are silenced; . . . [the true sciences] do not nourish on the dreams of investigators but proceed in orderly sequence from the first true and established principles through successive

stages to the end" (*Trattato della pittura*, par. 29). And their character is further specified by Leonardo, both for the mathematical fundamentals concerned and for their relationship to things. He tends to consider natural processes as reducible to mathematical fundamentals; and mechanical, "practical," or "manual" operations as an integral part of the very process of scientific knowing. ("These true and exact sciences belong to the mechanical sciences because they cannot be brought to conclusion without manual operations.")

Perhaps this is the most brilliant as well as the most ambiguous of Leonardo's positions: most brilliant if we observe the development of the relationship between theory and practice, of the idea of continuous intervention of the senses (through hand and eye), and of the concept of building "manually," which is present in drawing, painting, sculpture, and in all the natural sciences that are "brought to conclusion" by means of machines and various instruments.

Beginning with the science of painting ("which is first in the mind of the conceiver and cannot come into being without manual activity"), Leonardo posits a new significance for man and his relationship with nature: He holds that natural processes actuate, in concrete experience, a rational necessity for the shortest methods that can be devised (Cod. Arundel, 85v). But man, "the greatest instrument of nature," through experience becomes "an interpreter between resourceful nature and the human species" and may succeed in investigating the cause of these natural processes (Milan, Ambrosiana, Cod. Atlanticus 86r-a). The knowledge of causes, which by necessity guide the creative processes, allows man to insert in nature, which does not vary the ordinary species she has created, the temporal novelty of his own creations. Nature "is concerned only with the production of elementary things," while man "with these elementary things produces an infinite number of compounds [which] change with the passage of time."

While the various "true sciences" with "manual operations" and machines diffuse pragmatic knowledge in every possible direction, the reflection on nature — which has its own "reasons," or rational necessity, and which, as he also recognizes, encompasses the human sphere — constitutes the philosophic nucleus of Leonardo's idea of reflection. Yet while speculations on the "true sciences" present a solid beginning, in the area of "pure philosophy" we encounter only hindrances in the ambiguity of terms and concepts not yet resolved. His discussion of nature constrained to the necessity of laws recalls a historic theme already treated by L. B. Alberti. There is oscillation in meaning in his use of such terms as "spirit," "spiritual," "soul," and "force" — all of which are key concepts. [Opposing interpretations of his terms are given by C. Luporini (1953) and A. Marinoni (1954), for example.] Philosophically it is but one step from a mode of thought that reduces reality to a nature animated by infused "reasons" to a reality that subsumes nature within a spirit that inwardly nourishes the All. Thus Ficino echoed Lucretius, and Leonardo in turn echoed Ficino, although the Leonardian cadence differs: "home" is nature, not heaven; "the chief evil is the suffering of the body" (Milan, Bibl. Trivulziana, Cod. Trivulzio, 2v), not sin; and "the definition of the soul is left to the wisdom of the friars . . . , who by inspiration know all mysteries" (Windsor, Royal Lib., Quaderni d'Anatomia, IV, 1or). Here, in pragmatic knowledge and in "true science," lies Leonardo's personal quality as a thinker — in the convergence of an ardent naturalistic inspiration and an ambiguous Platonic atmosphere.

LESCOT, PIERRE. French architect (b. Paris?, ca. 1515; d. 1578). Traditionally regarded as the first "modern" architect in France, although his known or attributed works give no basis for such a characterization, Lescot can be associated securely only with a small section (southwest corner) of one building — the Palais du Louvre. Of this section, the courtyard façade alone remains relatively unaltered (V, PL. 396); the exterior façades have either been destroyed (south) or significantly remodeled (west). In the extensive documentation for this work (begun 1546), only one reference implies that Lescot actually was the building's "designer"; otherwise, the numerous documents identify Lescot as acting only as the king's "overseer" or "supervisor." He is similarly identified in the document (dated 1544, for work beginning in 1542) pertaining to the only other work with which Lescot is definitely known to have been associated — the altar screen for the Church of St-Germain-l'Auxerrois (dismantled 1745; no representations extant). Documents also give Lescot the titles of court chaplain, royal counselor, and canon (1554) at Notre-Dame, Paris. Ronsard, a fellow court member, describes Lescot as possessing a natural talent for painting and as having studied mathematics and architecture. Lescot's gift for painting is equally praised by Blaise de Vigenère (ca. 1595), who at the same time criticizes Lescot for attempting to direct the work at the Louvre — a building that those "learned in the art" find "filled with errors" — because such important edifices should not be undertaken by novice architects.

Thus, from the contemporaneous evidence, Lescot emerges as a talented amateur, not as an architect by profession: an estimate borne out by the Louvre project itself, where the final design (1551) was determined only after two previous ones (1546–48, 1549–50) had been partially executed. Since in each instance the effect of the façade became increasingly dependent upon a revolutionary use of relief sculpture, its design must have resulted from an intimate collaboration between Lescot and the sculptor-architect Jean Goujon (q.v.), who also had worked on the above-mentioned altar screen (fragments in the Louvre; V, PL. 395). Later writers foster the idea of their collaboration by attributing to Lescot the design of works decorated by Goujon: entrance portal, Hôtel Carnavalet (remodeled), attribution made only by H. Sauval (ca. 1655); Fontaine des Innocents, 1549 (first attributed 18th cent.). Nineteenth-century historians accepted both attributions and added others to substantiate their belief that Lescot was a critical figure in the formation and development of French architecture — a concept gradually being rejected by modern-day historians.

Bates LOWRY

LE VAU, LOUIS. French architect (b. Paris, 1612; d. Oct., 1670). Although Le Vau directed the majority of the vast building projects initiated by Mazarin, Colbert, and Louis XIV, he has never achieved the artistic fame that such accomplishments would normally bring. In part this fate results from Le Vau's practice of planning and directing numerous undertakings concurrently rather than developing his initial, often brilliant,

architectural concepts into carefully refined, final designs. Le Vau aimed principally for a striking over-all effect, with buildings composed of simple but contrasting volumes whose forms are strongly defined by light (manipulated through differentiating surface textures) and by large-scale, simplified membering. Placed within imposing settings (Vaux), Le Vau's work may appear impressive, but the repetition of stock motifs and the disregard for architectonic detailing denies his work the stamp of creative genius that turns buildings into works of art and their designers into esteemed architects.

Essentially, Le Vau was a builder and an organizer who directed a team of artists and relied upon assistants for the working drawings and daily supervision necessary at individual building sites. (This practice allowed one recent writer to claim that the bulk of Le Vau's work was designed by his assistant François d'Orbay.) In this role Le Vau was eminently successful, beginning with a series of town houses designed and built for the residential development of Île Saint-Louis (1638–48). Le Vau's replacement of Jacques Lemercier in 1654 as First Architect of the King opened a decade of extensive building activity: at Vincennes (1654–60); the Hospital of La Salpêtrière (1660); College des Quatre-Nations (1661 on); Hôtel de Lionne (1662); the Louvre (Galerie d'Apollon and adjacent buildings, 1661; south wing, completed 1663); Tuileries (1664 on); and at Vaux-le-Vicomte, where in only four years (1657–61) Le Vau created, with André Le Nôtre and Charles Lebrun (qq.v.), the most sumptuous residence in France (II, FIG. 289).

In 1664, however, upon Colbert's becoming director of the royal building works, Le Vau's artistic domination ended abruptly. Colbert immediately rejected Le Vau's design for the Louvre entrance façade, already under construction, and publicly requested that a better design be found. Colbert's ultimate choice — the Colonnade — was the product of a council (Le Vau, Lebrun, and Claude Perrault), a procedure Colbert favored because buildings so designed became known as the king's work, not as one artist's achievement. Thus, although Le Vau remained First Architect, the fame of the projects he directed (Louvre, Versailles) was not associated with him, since their designer's identity was obscured. Probably because he was more organizer than artist, Le Vau accepted Colbert's dictates, although the decision to destroy his south façade of the Louvre — finished only five years before — must have been a difficult one for Le Vau to concur with.

Bates LOWRY

LIANG K'AI. Chinese painter, born third quarter of the 12th century, died probably after 1246; also called Po Liang (*tzŭ* or alternate name) and Liang Fêng-tzŭ (*hao* or nickname).

Together with Fa-ch'ang (Mu-ch'i, q.v.), Liang was one of the most important painters of the late Southern Sung dynasty. The basic biography from which all subsequent ones are derived is recorded in the *T'u-hui pao-chien* (preface dated 1365) by Hsia Wên-yen. The artist was a descendant of Liang I (or Liang Hsi), who rose to be chief minister in the feudal principality of T'ung-ping (Shantung prov.) under the Han dynasty. Hsia goes on to say that Liang K'ai was a good painter of human figures, landscapes, Buddhist and Taoist subjects, ghosts, and celestial deities. He was a "follower" (pupil?) of Chia Shih-ku, who was recorded as a "Painter-in-Waiting" (*chih-hou*) at the court of Kao-tsung (1127–62). Evidently Liang surpassed his master, for in the Chia-t'ai era (1201–04) of the reign of Ning-tsung he was made "Painter-in-Attendance" (*tai-chao*) and was awarded the Golden Girdle, the highest honor available to a painter of the Imperial Academy. The artist, preferring less official recognition, returned the Girdle and departed. The *T'u-hui pao-chien* records that Liang was fond of wine and humorously called himself "Liang the Eccentric" (Liang Fêng-tzŭ). His remaining paintings, says the standard biography, are sketchy and executed in an abbreviated manner (*chien-pi*).

A few significant additions can be made to this all too brief outline. Since during the reign of Li-tsung (1225–64) one of Liang's pupils, Yu Hung, was made "Painter-in-Attendance," it may safely be inferred that Liang had pupils and that his teaching was recognized. Two dates referring to Liang give evidence of his life span. One of Liang's lost, but recorded, paintings bore the title *The Ch'an Master Miao-fêng Being Carried Out by Four Ghosts at Night*. Since the subject of the painting, Miao-fêng, died in 1235, Liang must have lived beyond that time. The reference seems reliable, occurring in the collected literary works of Chung-fêng (d. 1323), a close friend of Chao Mêng-fu (q.v.), the early Yüan painter, scholar, and official. In the collected poetry of Pei-chien, another Ch'an monk (d. 1246), one poem is "presented to the Imperial Attendant Liang of the Court Service" and reads in part (trans., Wai-kam Ho): "Liang K'ai treasured his ink as if it were gold./ But when he got drunk [the valued drops of ink] could suddenly become a downpour. / Sometimes singing, sometimes silent, this heavenly music comes and goes by its own will. / While the ordinary painters could do nothing but [lay down their brushes and] become completely lost." This would indicate that Liang must have lived at least until 1246, since the poem was presented, not dedicated, to him, and that he was still associated with the "Court Service," either in fact or by honor.

Later sources repeat the old biography and often embroider it with clichés. A valuable note in Li Jih-hua's (1565–1635) *Tz'ŭ-t'ao-hsuan tsa-cho* says (trans., O. Sirén): "He painted Buddhist and Taoist figures with great refinement, including even the smallest details, but the rocks and trees he dotted down quite freely, apparently without intention. Yet, the intention was to increase the effect of life by the free and vigorous brushwork, since the figures were so delicately drawn." Since Liang's master, Chia Shih-ku, is listed in the *T'u-hui pao-chien* as a 12th-century follower of Li Kung-lin (q.v.), the great Northern Sung painter of the fine-line (*pai-miao*) style, the words "refinement," "details," and "delicately" are not without significance for Liang's early works. Another late reference in the *I-men kuan-tu* is quoted in the *Nan-sung yüan-hua lu* (1721), and notes that Liang painted with wedgelike strokes (*pieh-na*, strokes like those of the character *jên*) and with strokes like broken reeds.

A summary of the Chinese historical records referring to Liang K'ai can be ended with a list of some of the titles of paintings by the master, now lost: *T'ao Yüan-ming with a Chrysanthemum Flower Standing beneath a Pine Tree; Confucius Dreaming of the Duke of Chou; Chuang-tzŭ Dreaming He Is a Butterfly; Mêng Hao-jan Riding a Donkey on the Pa Bridge; Chung-k'uei the Demon Queller; P'u-t'ai; The Ch'an Master Miao-fêng Being Carried Out by Four Ghosts at Night; Portraits; Frogs Chasing Ants; Withered Lotus; Village Joys; Pen-hsiang* or *A Pictorial Representation of the Lotus Sūtra*. The artist's subjects were varied and ranged over all three of the major faiths of his time and place: Buddhism, Taoism, and Confucianism.

That Liang K'ai in his later years became an artistic rebel, even an outcast, seems evident from his meager biography, from his relatively undistinguished ranking by later Chinese critics, and from the fact that all his extant works except two possible attributions — *Immortal in a Loose Gown* (Taichung, Formosa, Nat. Palace Mus.) and *The Supreme Taoist Master, Chang T'ien-shih, Holding Court* (PL. 129) — are to be found in Japan. They have been there since at least the 14th century, when they were imported as part of the massive wave of Ch'an (Jap., Zen) influence from southern China after the troubles at the end of the Southern Sung and the beginning of the foreign Mongol (Yüan) dynasty. Paintings by Liang K'ai are listed in Japanese sources from the *Kundaikan Sayuchōki* (extant in two versions, 1476 and 1511) on, particularly in later Zen diaries and tea ceremony (*cha-no-yu*) records. While Liang had little influence on later Chinese painting, such Japanese artists as Sesshū (q.v.; 1420–1506), Yūshō (1533–1615), and Niten (1584–1645) owe much to his style.

This important relation to Japanese art, Zen Buddhism, and the tea ceremony has served to confuse Liang K'ai's place in Chinese art history. He was not a Ch'an painter, though he

painted some Ch'an subjects and his later style was most acceptable to the intuitive, irrational, and often psychologically shocking practices of that sect. James Cahill has emphasized the Confucian origins of the various informal and heterodox styles of painting lumped together under the general heading of "literary man's painting" (*wên-jên-hua*). This includes the rough, "splashed ink" manner of Liang K'ai and his contemporary, the Ch'an monk Mu-ch'i. Its origins are to be found in a complex of reasons involving revolt against the herd and officialdom; the demonstration of character to one's equals without appeal to the herd; and the desire to exploit the full possibilities of ink and the Chinese writing and painting brush, the most flexible of all ancient painting instruments.

In Liang's case there is an additional factor — alcoholic inspiration. Two references to Liang's drunkenness have already been noted, and it is surely no coincidence that the two "fathers" of "splashed ink" painting, Wang Mo (d. ca. 805) and Hsiang Yung (late 8th cent.), were also recorded as lovers of wine who painted marvelously and wildly when drunk. It is an ancient belief, not unknown even today, that drunkenness is next to godliness, or at least that it places one nearer the sources of inspiration. Modern psychology at least partially supports this old idea. The power of alcohol to release inhibitions and make the drinker feel that he is elevated or superhuman is generally recognized, but the psychological lift is accompanied by a progressive decline in physical coordination. For the experience to be of value to the painter, the release of inhibitions must slightly overbalance on an esthetic scale the still not crucial loss of physical power. Only a tremendously disciplined talent can profit by these practices. Inebriation cannot bestow a technique; it can only lessen physical control and perhaps release psychic energy from its inhibiting shell of conformity. The vinous school of painting at its best may gain in spontaneity and the intuitive realization of visual images and of significant gestures and movements of the brush. The artist or his friends presumably censored the failures in soberer moments. The works resulting from this selection are surely masterpieces, and their appeal to Ch'an and Zen devotees is readily understandable.

The historical record that Liang K'ai's early style was careful and linear and that he later changed to the rough "splashed ink" manner is confirmed by the remaining works that can reasonably be attributed to him or to his immediate circle. More than any other artist of the Southern Sung dynasty, he proves to be a strong link with the past, as well as the author of a series of stylistically radical works that provide the ultimate exclamation point in the development of Sung painting.

Beginning as a follower of Chia Shih-ku, Liang was a disciplined painter of the by-then academic school of fine-line figure painting, whose greatest name was Li Kung-lin (q.v.). The scroll of *The Supreme Taoist Master* (PL. 129) is a conservative work, even rigidly iconic, in the best Buddhist and Taoist painting tradition. One need only substitute a Buddha for the Master and bodhisattvas for the attendants to obtain an almost typical 12th-century sūtra painting. The carefully controlled, thin, even lines and the repetitive faces, draperies, and clouds are sensitive and sure but still have a religious geometry. As in Italian painting of the late 14th and early 15th centuries, the progressive and esthetically rewarding passages of the painting are to be found in the secondary scenes at the right and left of the central iconic representation. There, in scenes of artisans at work making images, or in pathetic scenes with beggars and ghosts, or in a frightening scene in one of the hells, one finds a freer brushwork, still immature but crackling, bordering on the weird and grotesque — a portent of Liang's later painting style. Other works, now lost, must have been executed in this style, including such recorded works as *Village Joys* or *Scenes of Rice Culture and Sericulture* (known only in a copy reproduced by Tanaka) and such free variations as the scroll by Chêng Chi now in the Freer Gallery, Washington, D.C.

If the *pai-miao* figure style was Liang K'ai's early discipline, he soon mastered the great monumental landscape manner of the Northern Sung dynasty and the lyrical, fragmented, and asymmetrical style of the Southern Sung Academy, best known in the works of Ma Yüan and Hsia Kuei (qq.v.). *Snow Landscape with Two Horsemen Near a Mountain Pass* (PL. 128) combines the rugged monumentality and foliage conventions of Fan K'uan (active ca. 990–1030) with the daring simplification and asymmetry initiated by Li T'ang after the fall of the Northern Sung in 1127 and developed further by the "Ma-Hsia" school. A trace of Liang's beginnings is to be found in the fine and accurate rendition of the gateway guarding the high distant pass. Though Liang lived in the south, this landscape is the conventional rendition of the bare and lonely northern frontier characteristic of much Northern Sung painting associated with Fan K'uan, Li Ch'êng, Kuo Hsi, and others.

Liang must have deserved his official honors because of both his early styles; the *Śākyamuni Descending from the Mountain on His Way to the Bo Tree*, which is comparable with the *Snow Landscape with Two Horsemen* in many respects, bears an inscription that it was painted for the emperor after Liang's promotion to *tai-chao*. The subject, the Buddha-to-be forsaking his fruitless austerities and moving through a grim winter setting toward his final Meditation and Enlightenment beneath the Bo tree, became a standard one for Japanese Zen painters — the *Shussan-no-Shaka*. (Cf. the early 14th-century iconographic sketch, perhaps based on Liang's painting, in the Seattle Art Mus.; S. E. Lee, "Japanese Monochrome Painting at Seattle," *Artibus Asiae*, XIV, no. 1–2, pp. 43–61.) While Liang K'ai's Śākyamuni moves in a landscape whose vastness is suggested by expressive fragments — a cliff, a gnarled tree — the figure itself is more carefully painted and recalls Liang's early work. The swirling drapery even goes back to T'ang Buddhist prototypes, notably the "Western" style of drapery derived from northwestern India via Central Asia. It is a deeply moving picture, not only because of the intense concentration depicted in the face but also because of the poignant tension between the rather slight, inwardly focused figure and the rough, almost threatening environment. This great masterpiece must stand near the mid-point of his creative years. Some small album leaves appear to be of a similar nature, notably the *Herons Near a Rocky Bank* (PL. 131), though this particular leaf betrays an impatient freedom that is closely related to the group of "splashed ink" paintings that crown the artist's achievement.

While "splashed ink" painting has been much associated with Ch'an Buddhism, its origins, as mentioned above, are properly placed with the initial stages of Chinese *wên-jên-hua* and are partially connected with the influence of alcoholic inspiration. The two surviving and relatively sure examples of this aspect of Liang K'ai's art are *Hui Nêng, the Sixth Ch'an Patriarch, Chopping Bamboo at the Moment of Enlightenment* (PL. 130) and *The Poet Li Po* (IV, PL. 282). The former is a Buddhist subject emphasizing the irrational and haphazard occurrence of Enlightenment, and the latter is a traditional Chinese subject, largely Taoist in its overtones, stressing the free and independent character of the soul of a noble man. *Hui Nêng Chopping Bamboo* is the more extreme of the two, its brushwork and ink ranging from the wildest scrubbing on the tree trunk to sharp, sword-cut strokes in the draperies and hands and in the joints of the bamboo. Many parts seem to exploit happy accidents in a manner not unlike that of modern "action" or impressionist painters. Accidental splashes of ink resulting from the frenzied, possessed (or, if one prefers, drunken) actions of the artist are to be found on the right thigh of the patriarch and in the bank on the lower left. The over-all impression is one of tremendous strength and inspired rapidity of execution. Rough and brutally direct, the painting has an impact that defies lengthy rational analysis. In this it is unique, since the two famous and related hanging scrolls, *Hui Nêng, the Sixth Ch'an Patriarch, Tearing a Sūtra* and *P'u-t'ai Carrying His Sack*, seem more elegant and contrived, their slighter brushwork and conscious drollery indicating a skillful, even inspired, Japanese copyist. The immense popularity of Liang K'ai and Mu-ch'i among such Zen monk-painters as Sesshū, Kaō, and others inevitably led to much copying, sometimes signed by the copyist (Sesshū in particular has left at least two signed copies of Liang album leaves).

The somewhat damaged but cleverly restored *Li Po* shows the calmer side of inspiration. The dominant brush strokes are long and wet with soft edges. Only in such accents as hair,

features, and feet does the artist reveal the sharp and staccato accents of which his brush was capable. Again the initial impact remains memorable. Tranquil nobility of character is revealed in an almost weightless, grave image in slow movement — certainly one of the greatest pictorial expressions of the ideal of the Chinese literary man. It cannot be without significance that numerous tales are told of Li Po's inspired participation in parties where wine flowed endlessly. Seen in this light, the tilt of the poet's head and his open, perhaps singing mouth may indicate that "Liang the Eccentric" had imagined the subject to his liking.

Beyond these examples of "splashed ink" the rational Chinese were loath to go. The Japanese of the Muromachi period (1333–1568) pushed the style, called by them *haboku*, to further extremes. But the Chinese artists during the Yüan dynasty (1280–1368), of both the academic and *wên-jên-hua* persuasion, returned to previous styles for points of departure. Only the monk-painters of the Ch'an monasteries or a few isolated Taoists or amateurs seriously continued the "splashed ink" manner; they could not match the great Liang K'ai and Mu-ch'i, whose works in this style were the proper ending to the development of Sung painting.

WORKS. *a. Probably original: The Supreme Taoist Master, Chang T'ien-shih, Holding Court*; hand scroll in ink on paper. Signed, Liang K'ai; colophon by Wang Chih-têng dated 1568. Formerly, An Kuo Coll. (early Ming collector); now New York, H. C. Weng Coll. – *Śākyamuni Descending from the Mountain on His Way to the Bo Tree*; hanging scroll in ink and faint color on silk. Signed, Painter in the Imperial Presence, Liang K'ai; one identified seal. Formerly, Sakai Coll.; now Tokyo, Coll. E. Shima. – *Snow Landscape with Two Horsemen Near a Mountain Pass*; hanging scroll in ink and faint color on silk. Signed, Liang K'ai; seal of Ashikaga Yoshimasa. Formerly, Akaboshi Coll.; now, Tokyo, Nat. Mus. – *Three Ancient Trees in a Snowy Landscape* (PL. 127); hanging scroll in ink and faint color on silk. Unsigned; seal of Ashikaga Yoshimasa. Formerly, Tokyo, Matsudaira Coll.; now, Tokyo, Nat. Mus. – *Herons Near a Rocky Bank*; oblate circular album leaf in ink on silk. Signed, Liang K'ai. Formerly, Coll. Daté; now, Miyagino, Kanagawa, Japan, Hakone Art Mus. – *Geese and Reeds*; rectangular album leaf in ink on silk (*Liang K'ai*, 1957, pl. 22). Signed, Liang K'ai (later addition?). Formerly, Coll. of the Tokugawa family; now, Coll. K. Yamanouchi. – *Hui Nêng, The Sixth Ch'an Patriarch, Chopping Bamboo at the Moment of Enlightenment*; hanging scroll in ink on paper. Signed, Liang K'ai; seal of Ashikaga Yoshimitsu at lower left. Formerly, Sakai Coll.; now, Tokyo, Nat. Mus. – *The Poet Li Po*; hanging scroll in ink on paper. Signed, Liang K'ai; unidentified seal at upper right. Formerly, Tokyo, Matsudaira Coll.; now, Tokyo, Nat. Commission for the Protection of Cultural Properties. – *Han-shan and Shih-tê*; hanging scroll in ink on paper (*Liang K'ai*, 1957, pls. 13–14). Signed, Liang K'ai (later addition?); seal of Ashikaga Yoshimasa. Formerly, Coll. Isogai; now, Miyagino, Kanagawa, Japan, Hakone Art Mus.

b. Some copies after, or paintings close to, Liang K'ai: Wang Hsi-chih Writing on a Fan; Chinese copy; hand scroll in ink on paper (*Liang K'ai*, 1957, fig. 1). Signature of Liang K'ai and several purportedly Yüan colophons, one dated 1324. Formerly in collection of the emperor Ch'ien Lung and the Manchu Household Coll.; now, Peking, Coll. Bur. Cultural Property Administration. – *Hui Nêng, the Sixth Ch'an Patriarch, Tearing a Sūtra* (traditionally paired with *Hui Nêng Chopping Bamboo*); hanging scroll in ink on paper (*Liang K'ai*, 1957, pls. 6–7). Signature of Liang K'ai. Formerly, Tokyo, Matsudaira Coll.; now, Coll. T. Mitsui. – *P'u-t'ai Carrying His Sack*; early Japanese copy (?), related to *Hui Nêng Tearing a Sūtra*; hanging scroll in ink on paper (*Liang K'ai*, 1957, pls. 10–12). Signature of Liang K'ai; two seals above, one of Ashikaga Yoshimitsu, the other (with a poem) of the Ch'an monk Ta-ch'uan Pu-chi (d. 1253). Formerly, Coll. Marquis Oshu; now, Osaka, Coll. Murayama. – *P'u-t'ai Watching a Cock Fight*; Japanese copy; hanging scroll in ink on paper (*Liang K'ai*, 1957, fig. 6). No signature. Formerly, Odawara, Coll. Masuda; present location unknown. – *Winter Landscape with Birds and Alighting Heron* (somewhat damaged, possibly very close to *Herons Near a Rocky Bank* and *Geese and Reeds*); oblate circular album leaf in ink and faint color on silk (S. E. Lee, *Chinese Landscape Painting*, Cleveland, 1954, no. 22). Signature of Liang K'ai. Formerly, Denman Ross Coll.; now, Cambridge, Mass., Fogg Art Mus. – *A Wandering Poet by the Marsh Land*; oblate circular album leaf in ink and faint color on silk. Signature of Liang K'ai. Formerly, Coll. Chang Ta-ch'ien; now, New York, Coll. J. M. Crawford, Jr. – *Immortal in a Loose Gown*; Yüan copy (?); rectangular album leaf in ink on paper in the album *Ming-hua lin-lang* (*Three Hundred Masterpieces of Chinese Painting in the Palace Museum*, Taichung, 1959, vol. III, no. 118). Signature of Liang K'ai. Formerly in the collection of the emperor Ch'ien Lung; now, Taichung, Formosa, Nat. Palace Mus.

LIBERIA. The Republic of Liberia, independent since 1847, occupies that part of the coastal zone of western Africa between the Mano and Cavally rivers and borders Sierra Leone, the Ivory Coast, and the Republic of Guinea. Geographically varied, the region comprises a narrow strip of marshy coast covered by dense forest, a wide hilly plain (beginning 7–15 miles from the coast), also covered by forests, and a plateau with savanna and woodlands in the interior. It is inhabited by several ethnic groups, of which the best-known are the Kpelle and the Dan (see GUINEAN CULTURES).

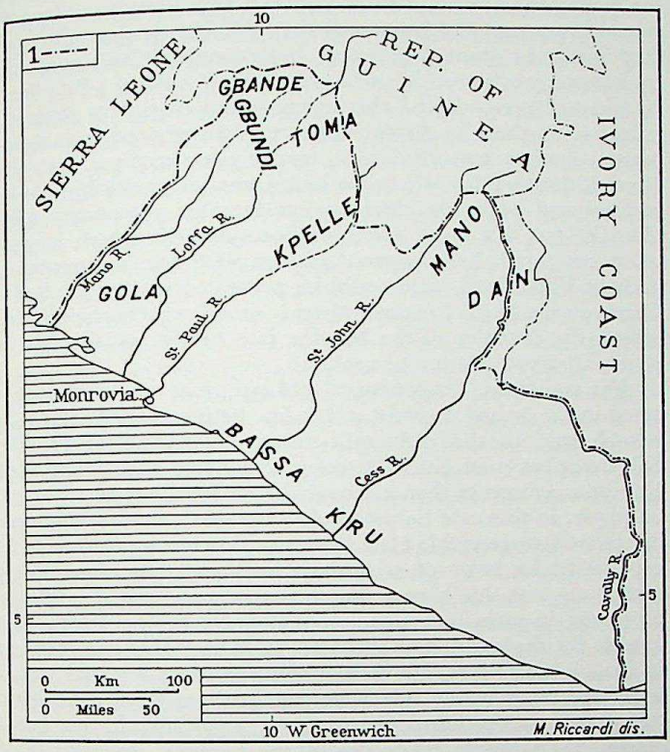
At present there is no evidence of prehistoric or archaeological discoveries in the area, although the working of bronze among the Dan-Ngere groups seems to have begun quite early. Today art production, except for bronze casting, is limited to wood sculpture.

The coast is inhabited largely by the descendants of repatriated American slaves, who are so strongly Westernized in culture that they produce no significant art of indigenous inspiration.

Almost nothing is known of the representational sculpture of central Liberia. A few masks undoubtedly from the area reveal a mixture of naturalism and stylization, with long slender face, high round forehead, aquiline nose, and eyes formed by large protruding cylinders in which are set metal plaques. These may derive from similar masks of the Kono tribe of Sierra Leone (q.v.).

Most of the extant art of Liberia is a product of the tribes living on the interior plateau, whose chief form of expression seems to be the mask, although some examples of freestanding sculpture and of the minor arts can be found. Although it is almost impossible to make stylistic distinctions about this interior culture, it can be said that the art of the northwestern groups seems to be particularly related to ancestor worship or to the various secret societies; the northeastern art shows clearly defined stylistic peculiarities but has been mainly inspired by the styles of the Republic of Guinea.

The Gbundi and Toma (or Loma) tribes in the northwestern part of the country make male and female wooden figures, which are shaped like posts and are kept in special huts. More numerous are zoomorphic figures, perhaps connected with totemistic beliefs, which are generally of rather crude workmanship and take the form of elephants, snakes, crocodiles, birds, and fish.



In comparison with the statuary, the masks — especially those connected with the Poro secret society — are of greater variety and esthetic value. The Toma, who move back and forth across the border of the Republic of Guinea, create a flattened and stylized mask, with eyes and nose barely indicated by a line and with hornlike appendages surmounting the upper part. Another northwestern tribe, the Gbande, make game masks worn by both men and women at feasts in honor of the dead.

The Gola people, living farther southwest, toward the coast, have absorbed the style of the Mende (or Mendi; see SIERRA LEONE). This borrowed style is reflected in the masks connected with the Bundu, a female secret society. The two outstanding features of these masks

are the real human teeth inserted in the mouth and the lips painted red, contrasting sharply with the black background.

South of the Gola territory the Mende style appears again in large masks produced by the Bassa, a tribe of the Kru group. In both the large masks and the miniature replicas (ht., ca. 3 in.) the eyes are indicated by only a slight swelling without a slit. Like other Kru tribes, the Bassa carve wooden figures; these have large heads in which the small rounded mouth and the facial planes meet at a 45° angle.

The Kpelle, a large group of whom is also settled in the Republic of Guinea, produce their masks in connection with the male

Liberia, distribution of principal tribal groups that produce art (names in heavy capitals). *Key*: (1) Modern national boundaries.

Poro society. Their style recalls that of other Liberian masks, such as those of the Mano, of the Ge, and of the western Ivory Coast. The mask generally represents a human face in the form of an oval with a pointed chin, two circles for the eyes, a wide flattened nose, and a pronounced mouth, sometimes set with human teeth (IV, PL. 175); the chin terminates in a beard of plant fibers, and the top of the head may be covered with a hat. Kpelle craftsmen also make small masks (common among the Mano and the Dan as well) representing ancestors and protectors and occasionally having animal features.

The northeastern tribes are linked to those of the northwest by the Mano people, whose art forms a stylistic bridge. Other northeastern groups of outstanding artistic ability are the Dan, together with their sub- and related groups, the Ge, Gio, Yakuba, and Ngere, or Guere (VII, PLS. 118, 120, 121). All these peoples excel in the art of wood sculpture, a hereditary craft, transmitted from father to son, often carried on in secret. Less important today is the casting of metal (formerly bronze) by the lost-wax process.

The Mano, the Dan and minor groups, and the Kru (who are distributed between Monrovia and the Bandama River in the Ivory Coast) create masks associated with both the male (Poro) and female (Sande) societies; they can be divided into six principal types. The first category consists of carved "portrait" masks, with a spiritualized expression, small eye slits, and vertical scarification from the forehead to the nose (Mano). The second kind is like the first, but with hair and beard of human hair or of plant fibers and with the eyes indicated by white or red paint or by strips of colored cloth (Mano). The third is again of the same type, but with protruding tubular eyes and a forehead often decorated with carving (Mano). The fourth is distinguished by a beak-shaped, occasionally movable, mouth (IX, PL. 356). These four types of mask are produced south of Mount Nimba, in the border area between the Mano and the Dan-Ge territory. Ancestor masks, with the upper part representing the human face and surmounted by horns, comprise another aspect of mask making. To this type belong enormous stylized masks with great hollow triangles or round holes for the eyes (Dan, Ge) and miniature masks, which repeat every type of ancestor mask and are worn by the owner on his person or kept in the home. Finally, a unique category comprises the fantastic ape masks.

Sculpture in the round — once closely connected with ancestor worship but now embracing secular subjects — is dominated by the Kru, who also furnish the Mano and the Dan with their art products. Almost always the sculptor works for a chief, and, since present-day statuettes are mostly female, it seems that he is more or less required to portray the various women in the family of his patron. Generally the works of the groups can be distinguished by the tattoo marks and the headdresses. The sculptural style is rudimentary but relatively naturalistic. Although the faces are usually stylized, each statuette bears the name of the person it represents. At one time these figurines represented tribal ancestors and, on the occasion of festive dances, were anointed with palm oil and sprinkled with animal blood. Other relics of ancestor worship are the one- or two-headed herms (the latter supposedly the older), sometimes of wood but more often of clay. In the shape of monstrous human heads, always crowned by feathers, they guard the huts and their inhabitants.

That working of bronze among the Kpelle, Mano, Dan, and Kru is a fairly ancient art is shown by the use of certain ornamental motifs found in the Cameroons as well, suggesting some relationship with the styles of Nigeria (Schweeger-Hefel, 1948). Today the working of brass is influenced by the neighboring Anyi-Baule of the Ivory Coast and has almost disappeared from native Liberian art. The lost-wax system is used, with a separate casting of the various pieces, which are then soldered together.

The most frequent motifs of freestanding metal sculpture are mothers with children (VII, PL. 121), horsemen, animals, and standing or seated figures, occasionally on stilts. Objects of personal adornment (for which imported aluminum is increasingly replacing brass and bronze) include bracelets, rings, and pendants. These pieces often have fine geometric engravings, which at times signify the grades in the different secret societies.

The rude, utilitarian pottery, handmade by women using the coil technique, is occasionally ornamented with a lozenge, cord, or wave pattern (Mano, Dan).

Among the decorative objects worthy of mention are the ceremonial wooden spoons, which, although carved by Kru women, are found throughout most of Liberia. The handle terminates in a skillfully shaped male head. These spoons are inherited in the female line and are carried by the women when they dance. Other products of the Kru people are their fine carved wooden plates.

The Dan tribes specialize in worked-leather weapon sheaths and gunpowder cases; occasionally they also decorate the interior and exterior walls of their huts with paintings, but these are less esteemed.

Art of colonial derivation is practically nonexistent except in the capital, Monrovia, which was the first civil nucleus. Founded in 1822, the present city of over 80,000 inhabitants includes some very modern buildings (University of Liberia, Capitol). Most of the rest of the country, however, has retained the traditional character of the native village.

LI KUNG-LIN. Chinese painter of the late Northern Sung period; also known as Li Po-shih (*tzŭ* or alternate name) and Li Lung-mien (after the Lung-mien Mountains, where he spent his last years). Li Kung-lin was born in Anhwei province, south of the Yangtze River, about 1049. His father was an antiquarian and collector of books, and Li grew up in scholarly and artistic surroundings. After receiving the standard Confucian education, he passed the examination for the *chin-shih* ("Bachelor of Arts") degree in 1070 and embarked on his career as a government official, following the usual course for a man of the educated class (or literati) in China. He attained moderately high rank, becoming a secretary in the Imperial Board of Revision.

More important to his artistic development was the fact that his official post brought him to the capital, Kaifeng, and into its stimulating intellectual circles. Li Kung-lin became one of the luminaries in a brilliant coterie of scholars, officials, poets, and artists, of which the central figure was the great Su Shih, or Su Tung-p'o (1036–1101). Others included several painters — the master of ink bamboo Wên T'ung (active ca. 1049–79), the landscapists Wang Shen (b. ca. 1046, d. after 1100) and Mi Fu (Mi Fei, 1051–1107; q.v.) — and calligraphers such as Huang T'ing-chien (1050–1110) and Su Shih himself. Within this group, just at that time, a new concept of painting was evolving, with a new system of artistic values that rejected traditional criteria of excellence (fidelity to the subject, visual beauty, skill) in favor of unorthodox techniques of brushwork and forms expressive in themselves rather than primarily descriptive. The literati artists sought to capture in their works a special refinement and "literary" flavor that would reflect their own characters as sensitive, literate Confucian scholars. As amateurs, they avoided styles that required high technical finish and implied "professionalism"; as collectors and connoisseurs familiar with old paintings, they imitated antique styles, bringing the factor of conscious archaism into Chinese painting, perhaps for the first time. This was the origin of the school that came to be known as "literati painting" (*wên-jên-hua*), which was eventually to divert the whole course of Chinese painting.

Li Kung-lin followed the main doctrines of this school in his life and art. He collected paintings and took every opportunity to copy famous old works until he felt he had absorbed the best points of the old masters; then he went on to create a style of his own. His declared aim in painting, like that of most other literati artists, was personal expression. Complaining that people were always asking him to paint pictures for them as if he were a professional, he is reported to have said: "I make paintings as a poet composes poems; I lyricize my nature and feeling, and nothing more." The conception of the work was all-important to him, he claimed; the planning of the composition and execution of details were secondary. All this is what one would expect of a scholar-painter. In other ways, however, he was atypical. For one thing, he was evidently an accomplished technician and could, when he chose, paint with great skill. Also, he was concerned with religious subjects to a degree quite unparalleled in the literati school.

When he was about sixty years of age, he lost the use of his right arm through rheumatism but went on painting, using his left. About the same time, in 1100, he retired to a villa in the Lung-mien ("Sleeping Dragon") Mountains and thereafter called himself Lung-mien Chü-shih, "The Retired Scholar of Lung-mien." One of his most famous works, a scroll entitled *Dwelling in the Lung-mien Mountains* (PL. 134), represents the environs of his mountain retreat. He died in 1106.

Li Kung-lin has been regarded by some Chinese writers (e.g., Hsia Wên-yen, the author of the 14th-cent. biographical compilation *T'u-hui pao-chien*) as the greatest of the Sung dynasty artists. This judgment seems extravagant today, and modern authorities are more temperate in their evaluations. It must be remembered, however, that any modern evaluation is hampered by the absence of really reliable works from his hand and by inadequate understanding and appreciation of the kinds of painting in which he excelled. Among Chinese artists of the first rank Li Kung-lin remains perhaps the most complex and problematic. Even if we disregard the adulation accorded him in later times and depend upon reports from writers fairly close to him, who may have known him and seen his genuine works in considerable numbers, it is still difficult to discern any very clear artistic personality. Moreover, there is a similar lack of consistent character in the extant paintings attributed to him.

He is said to have begun as a painter of horses, adopting at first the style of the T'ang master Han Kan (8th cent.) but later developing a more original mode, and also relying heavily on actual observation of horses, especially those of the imperial stables, to which he had access. In order to understand better his equine models, he identified himself with them to a dangerous degree; such, at least, was the opinion of a certain aged Buddhist, who warned him that if he persisted he would end by becoming a horse. Li, who was himself a devout Buddhist, is said to have accepted this warning and turned to religious subjects. In these he displayed a certain unorthodoxy in subject matter, portraying Buddhist figures — especially Kuan-yin (Avalokiteśvara), for whom he had a special predilection — in settings and poses that had no iconographic precedent. Like Wu Tao-tzŭ, his great T'ang predecessor with whom he was often compared, he preferred subjects with secular overtones, such as Vimalakīrti, who could be presented in the guise of a Chinese sage (e.g., *Vimalakīrti and Attendant*; see below), or arhats, the disciples of the Buddha (see below), or the figures of the *Hua-yen Sūtra* (PL. 135).

His copies and imitations of old paintings were often executed in the orthodox mode, in ink line with colors on silk. Liu K'o-chuang, in the early-12th-century *Hou-ts'un t'i-pa* (IV, 8b), describes a Li Kung-lin copy of a horse painted by Han Kan and comments that, although Li ordinarily worked in ink on paper, in this case he used colors on silk because he wanted his picture to resemble Han Kan's as closely as possible. His original works, however, were done in the manner most closely associated with his name, the fine ink-line drawings, usually on paper, in plain (i.e., uncolored) delineation (*pai-miao*). His models for the creation of this style were probably ink sketches in Buddhist iconographic sketchbooks, cartoons for wall paintings, and other works that were not in themselves considered "finished" productions. Occasionally, especially in his landscapes, Li Kung-lin made use of the broader, drier kinds of brushwork characteristic of the literati school. A critic writing shortly after Li's death remarks that, although his detailed paintings in color could be imitated with fair success by common artists, his rough and abbreviated style could never be approached by others.

The paintings attributed to Li Kung-lin that are executed in colors on silk do not seem, on the whole, to have much likelihood of being originals or even close copies. The only possible exception is *Horses Being Driven to Pasture* (see below), which, according to the inscription on it, is a copy of a work by the T'ang dynasty master Wei Yen. This agrees with the statement cited above that Li used this orthodox mode for his copies and imitations of old paintings. A better-known horse painting ascribed to Li Kung-lin, quite possibly an original, is the *Five Horses and Grooms* scroll (PL. 132), formerly in the Kikuchi Collection (Tokyo), but reportedly destroyed during World War II. Painted in ink on paper and, except for some shading on the horses, in the *pai-miao* technique of line drawing, it is the work of a highly accomplished draftsman, whether Li himself or not. The figures, and perhaps the horses also, seem to have antecedents in T'ang paintings but are drawn with greater realism and a special elegance that is of Li's own period.

Another extraordinarily skillful performance in the *pai-miao* technique is the hand scroll illustrating a historical anecdote, *General Kuo Tzŭ-i Receiving the Homage of the Uigurs* (PL. 133). The line, although it is fine and precise, is not of even thickness, but swells and tapers in perfectly controlled rhythms. The figures are expertly characterized, and the drama of the situation is well brought out in their postures and interrelations. This is once again the work of a master draftsman, although it cannot be confidently assigned to Li Kung-lin; the signature is probably an interpolation, and some features of the painting indicate a later date and even a different stylistic school. Prob-

ably closer to Li Kung-lin's own style, whether or not a work from his hand (a question that cannot be decided on the basis of reproductions), is the *Dancing Peasants* scroll (also known as *Beating the Ground*; PL. 134). The fluctuating brush line moves more freely and swiftly, seeming less tightly controlled than in the *Kuo Tzŭ-i* scroll, and there is evident that touch of conscious naïveté — partly occasioned by the popular subject, but also an ingredient of the style — that is found in other works ascribed to the master.

The association of Li Kung-lin with the literati school, his penchant for archaism, and the references in early texts to his "rough" style all suggest that technical skill and apparent sophistication in the drawing may not be satisfactory criteria for assessing the reliability of paintings attributed to him. Several works that would have to be rejected immediately on the basis of such criteria may in fact be early productions of his followers, if not his own. The long scroll of illustrations to the *Hua-yen Sūtra* (PL. 135) is one of these. An attitude of conscious primitivism underlies the expressionless faces and stiff postures, the unrealistic drapery drawing, and the decorative clouds. These qualities serve to impart a cool, classical air to the picture and a special dignity to the figures.

A different kind of primitivism, a naïveté with suggestions of amateurism in it, is seen in the scroll of the *Women's Classic of Filial Piety* (see below), a series of small and dark pictures on silk that may well go back to the late Northern Sung period. The inscriptions separating them have been accepted by esteemed authorities as authentic examples of the handwriting of Li Kung-lin. The line used for the figures and architecture is very fine, resembling pen drawing, and the brushwork in other parts, such as the contours of rocks, may give some clue to Li's "rough" style.

The evidence that these elements of primitivism and "roughness" were conspicuous in at least some of Li's works is too strong to be ignored; and it seems clear that they represent an attempt to recapture, or at least to evoke, the unsophisticated charm of archaic painting, but in a new context that in fact makes them quite sophisticated. Li's most renowned landscape composition, *Dwelling in the Lung-mien Mountains* (PL. 134), which exists in several versions, is plainly an archaistic play on such a T'ang landscape type as is seen reflected in extant copies of Lu Hung's *Ten Views from a Thatched Lodge*. (For the best extant version, see *Ku-kung ming-hua san-pai-chung*, 1959. The copy has been ascribed to Li himself, but is more likely later, perhaps 14th-cent.) The artist's intent is, in a sense, as much literary as pictorial. The same is true of the scroll illustrating the "Nine Songs" of Ch'ü Yüan (see below), which appears to be a copy of indeterminate date. In both scrolls certain very symmetrical arrangements of architecture and landscape violate canons of Li Kung-lin's own time; these arrangements, which again are probably references to T'ang designs, are echoed in various other works by Li's followers and were evidently among the distinctive features of the school manner. The distortions of form and space, the violent disproportion between the figures and their setting, and the scratchy brushwork set these pictures far apart from another variety of ink landscape, the abbreviated or "impressionistic" renderings of nature, such as, for example, the *Scenery of the Hsiao-Hsiang Region* (see below), also attributed to Li Kung-lin. This is a picture vastly superior as a landscape, but probably farther in style and taste from the work of Li himself. Nevertheless, there was a tradition in the Southern Sung and later periods connecting such misty river landscapes, done largely in a pointillist technique over graded ink washes, with Li Kung-lin: for instance, the *Panorama of the Upper Yangtze River* (see below), attributed to him but probably 13th-century in date, and the landscapes painted on screens depicted in a scroll by Mou I dated 1240. There was probably some basis for the tradition in Li Kung-lin's own works, as is reasonable in view of his close friendship with Mi Fei, who painted landscapes in a related manner.

The course of the Li Kung-lin school during the Southern Sung period (1127–1279) is represented in works connected with several of his followers. A scroll illustrating Su Shih's ode "Red Cliff," attributed to Li's direct disciple Ch'iao Chung-ch'ang (New York, Coll. J. M. Crawford, Jr.), is one of the most important because of its closeness to the master, as well as for its own high quality (Hsieh Chih-liu, 1957). A series of portraits of arhats in hand-scroll form, attributed to the 12th-century Ch'an Buddhist painter Fan-lung (Washington, D.C., Freer Gall. of Art), is untypical of the school in, for example, the remarkable characterization of the faces, but it displays the *pai-miao* figure drawing of the Li Kung-lin tradition in its finest form (Cahill, 1960). Another scroll (also Freer Gall.), a series of illustrations to the "Odes of Pin" section of the "Book of Odes," or "Songs" (*Shih-ching*), is attributed to the 12th-century court painter Ma Ho-chih; although the landscape elements are close to the style of that master, the figures are in the manner of Li Kung-lin, and the painting may be by some Southern Sung painter who was influenced by both. One of the most valuable of all, since it bears a trustworthy date, is the superb *Making Clothes for the Warriors* scroll by Mou I, dated 1240, formerly in the Palace Collection, Peking (*Ku-kung ming-hua san-pai-chung*, 1959; Sirén, 1956).

At least two paintings attributed to Li Kung-lin himself can be assigned with some assurance to the 13th century through their stylistic affinities with the work of Mou I. One is the famous *Realms of the Immortals*, a long hand scroll representing the Taoist paradise (PL. 136). The fantastic rock formations are clearly derived from the decorative rockeries of Sung gardens; the figures are delicately drawn in hair-thin lines and surrounded with faint ink washes shading outward into the enveloping space, a convention also seen in the Mou I painting but hardly to be met with elsewhere in Chinese painting. These two pictures also have in common a particular manner of outline and shading in the rocks and trees. Something essentially in agreement is seen also in another set of illustrations to the "Odes of Pin," which, like the scroll attributed to Ma Ho-chih mentioned above, represents agricultural occupations of the four seasons (Sickman, 1962, pls. 23–24). The childlike quality of the figures recalls the *Women's Classic of Filial Piety* and other works of the school; the suaveness apparent at some points of the architectural drawing and the *gaucherie* of some others suggest again a conscious primitivism.

The high point of Chinese esteem for Li Kung-lin was in the Yüan dynasty (1280–1368), when such major masters as Chao Mêng-fu (1254–1322; q.v.) and Ch'ien Hsüan (ca. 1235–1300) followed his style in their figure and horse paintings, and critics were unbounded in their praise. His influence declined after that, although a few Ming painters, notably Yu Ch'iu (late 16th cent.) did creditable imitations. Spurious "Li Kung-lins" were produced in abundance during the Ch'ing period, but these labored and tasteless productions preserve almost none of the essential features of the tradition.

WORKS ATTRIBUTED TO LI KUNG-LIN (inferior and obviously unrelated paintings omitted). *Horses Being Driven to Pasture*, after Wei Yen; hand scroll in colors on silk (Sirén, III, pl. 193). Peking, Hui-hua-kuan. Sirén says this may possibly be genuine. – *General Kuo Tzŭ-i Receiving the Homage of the Uigurs*; hand scroll in ink on paper (*Ku-kung ming-hua san-pai-chung*, II, no. 85). Signed. Taichung, Formosa, Nat. Palace Mus. – *Illustrations of the "Nine Songs" of Ch'ü Yüan*; copy after an original by Li Kung-lin (?); hand scroll in ink on paper (Sirén, III, pl. 198). Formerly, Peking, Palace Coll.; published there as a reproduction scroll in 1934. – *Dancing Peasants* (*Beating the Ground*); hand scroll in ink on paper; colophon dated 1265 (Sirén, III, pl. 194). Formerly, Peking, Palace Coll. Seen and photographed by Sirén ca. 1930, and judged by him an original. Present location unknown. – *Dwelling in the Lung-mien Mountains*; hand scroll in ink on paper (Sirén, III, pl. 195). Taichung, Formosa, Nat. Central Mus. Conceivably an original, but more likely a close and early copy of this famous composition. Another, greatly inferior version belongs to the Berenson Foundation, Settignano, near Florence (Sirén, II, opp. p. 44). – *Five Horses and Grooms*; hand scroll in ink on paper; colophon by Huang T'ing-chien (*Kokka*, 380; Sirén, III, pls. 191–192). Formerly, Tokyo, Kikuchi Coll.; reportedly destroyed in 1945. Quite possibly genuine. – *Vimalakīrti and Attendant*; hanging scroll in ink on silk (Sirén, III, pl. 199). Hauge Coll.; kept in Tokyo. A Sung work of high quality, but the connection with Li Kung-lin is tenuous. – *Arhats*; two hanging scrolls in ink and colors on silk, from a set of 16 (*Kokka*, 30, 41; S. Tajima, *Tōyō bijutsu taikwan*, VIII, Tokyo, 1908). Tokyo, Academy of Art. Twelfth-century works, perhaps in a stylistic tradition established by Li Kung-lin. Several copies of the whole set exist. – *Scenery of the Hsiao-Hsiang Region*; hand scroll in ink on paper (S. Shimada and Y. Yonezawa, *Painting in the Sung and Yüan Dynasties*, Tokyo, 1952, pl. 28). Tokyo, Nat. Commission for the Protection of Cultural Properties. The signature is evidently spurious; the painting is by another artist with the sur-

name Li, who is mentioned in a 12th-century colophon. – *Illustrations of the "Homecoming" Ode of T'ao Ch'ien*; hand scroll in ink and colors on silk (O. Sirén, *Chinese Painting in American Collections*, Paris, 1927–28). Washington, D. C., Freer Gall. Copy, 14th century or later, of a Sung work perhaps by Li Kung-lin. – *Panorama of the Upper Yangtze River*; hand scroll in ink on paper (*Kokka*, 273). Washington, D. C., Freer Gall. Probably a 13th-century work in the tradition of Li Kung-lin. – *Realms of the Immortal*; hand scroll in ink on paper (Sirén, III, pls. 196–197). Washington, D. C., Freer Gall. Thirteenth century, school of Li Kung-lin. – *The White Lotus Society*; hand scroll in ink on paper. Washington, D. C., Freer Gall. Copy, perhaps by Yu Ch'iu (late 16th cent.), of this famous composition. – *The Cassia and Epidendrum Palace*; hand scroll in ink on paper (Sirén, III, pl. 201). Washington, D. C., Freer Gall. A Ming-dynasty work, unrelated to Li Kung-lin. – *Seven Immortals*; hand scroll in ink and faint color on silk (Royal Ontario Museum, *Loan Exhibition of Chinese Paintings*, Toronto, 1956, no. 4). Ottawa, Nat. Gall. of Canada. – *Metamorphoses of Heavenly Beings According to the Hua-yen Sūtra*; hand scroll in ink and faint color on paper (L. Sickman and A. Soper, *The Art and Architecture of China*, Harmondsworth, 1956, pl. 96). Paris, C. T. Loo & Cie. An old and famous work, probably close to Li Kung-lin in period and style. – *Illustrations of the "Odes of Pin"*; hand scroll in ink on paper. New York, Coll. J. M. Crawford, Jr. Thirteenth century (?). – *The Drunken Monk* (i.e., the 8th-cent. Ch'an Buddhist monk-calligrapher Huai-su); hand scroll in ink and color on paper. Washington, D. C., Coll. Mrs. Eugene B. Meyer. Copy of Yüan period or later (?). – *Women's Classic of Filial Piety*; hand scroll in ink on silk. New York, Coll. C. C. Wang. Probably as early as Li Kung-lin, and possibly by him.

LI LUNG-MIEN. See Li Kung-lin.

LIMBOURG, Pol, Herman, and Jehanequin de (also called Malouel, Maelwael, Maelweel). Painters, sons of a sculptor (*beeldensnijder*) Arnold van Limburg (also called van Aken or Aachen) and nephews of Jean Malouel, the titular painter of Duke Philip the Bold of Burgundy, the Limbourg brothers were born after 1385 in Nijmegen. Undoubtedly on the recommendation of their uncle, they went to Paris about 1400 to apprentice themselves to a goldsmith. An account of 1402–03 mentions a contract dated Feb. 9, 1402, wherein two illuminators, Pol and Jean, were hired for four years to decorate a "très belle et notable Bible" for Philip the Bold. After the death of Philip on Apr. 27, 1404, nothing is known of them until the names of Pol and his brothers reappear in the accounts of Philip's brother Jean de France, Duc de Berry, in whose service they evidently replaced the painter Jacquemart de Hesdin about 1410. The posthumous inventory of the books of Jean de Berry, made in 1416, mentions "plusieurs cahiers de très riches heures que faisent Pol et ses frères." Their work remained incomplete, since they were all dead by February of 1416, and their patron, Jean de Berry, died on June 15 of the same year.

Leopold Delisle (1884) recognized as the "très riches heures" a volume in the library of the Duc d'Aumale at Chantilly. This fortunate discovery, together with the originality of the Limbourgs' clearly recognizable style, has made it possible to identify others of their works with near certainty.

The Bible executed for Philip the Bold has not been preserved. [A copy of a *Bible moralisée* painted in part by the Limbourg brothers and now in Paris (Bib. Nat., Ms. fr. 166) does not appear to correspond to the one mentioned in the accounts of Philip the Bold.]

Probably after Philip's death the young artists, deprived of their patron, continued to work on the Bible in some studio where they completed their artistic formation alongside fellow artists from the Low Countries who, like themselves, were established in Paris, which at that time attracted many foreign painters. One important workshop there was that of the Master of 1402, which employed Mosan and Rhenish artists. The Limbourg brothers reveal certain affinities with this group, from whom they borrowed numerous artistic formulas and acquired a general preciosity that was to become almost a mannerism toward the end of their careers. Nothing of their work before 1410 can be identified with certainty; two miniatures, however, from the vast Parisian production, may be by one of them, probably Pol, the oldest and apparently the most proficient of the brothers. The first of these, *The Court of Heaven*, formed the frontispiece of a Parisian copy of *The Golden Legend* of Jacobus de Varagine, dated 1404 (Paris, Bib. Nat., Ms. fr. 414, fol. 1); the scene was exactly duplicated by the brothers seven or eight years later in the *Belles Heures du Duc de Berry* (New York, Met. Mus., The Cloisters, 54.1.1., fol. 218). The second, a *Virgin with a Petition*, was painted on the dedication page of a collection of devotional works, also of Parisian origin (Paris, Bib. Nat., Ms. fr. 926, fol. 2), which was given in 1406 to Jean's daughter Marie de Berry by her confessor, the Augustinian brother Simon de Courcy. This miniature later served as the model for two facing pages, of controversial attribution, added to the *Très Belles Heures du Duc de Berry* (*Très Belles Heures de Notre-Dame*; Brussels, Bib. Roy., Ms. 11060–61), which was decorated for the duke before 1410 by Jacquemart de Hesdin. To these two miniatures it is perhaps possible to relate the frontispiece of another *Golden Legend*, of a slightly earlier date (Paris, Bib. Nat., Ms. fr. 242, fol. A). Although very similar in style, it is not necessarily by the same hand as that of Ms. fr. 414 and Ms. fr. 926 nor by one of the Limbourgs. Nevertheless, it does show the harmony of composition and elegant reserve that distinguish the works of the three brothers. The colors, the poses, the facial types have a quality that was to be typical of these extraordinarily gifted illuminators, whose artistic evolution proceeded with astonishing rapidity. The technical differences, due to the lapse of time between the presumed works of 1404–06 and the *Belles Heures du Duc de Berry*, an established work (ca. 1410–13), are not more problematical in this respect than those which distinguish the latter work from the *Très Riches Heures*, on which the Limbourgs were working in 1415 at the latest. The interval between the first two is approximately eight years; between the second and the last it is two or three.

At the court of Jean de Berry from about 1410 the Limbourg brothers found the conditions necessary for the independent development of their artistic personalities. They entered a new period, of which the *Belles Heures*, mentioned in an inventory of 1413, is the first datable evidence. The manuscript contains 94 large double-column miniatures, two-thirds or three-quarters of a column in length; 78 smaller one-column works, one-half the page or more in depth; and numerous initials. The decoration, markedly homogeneous, appears to be the work of one hand, certainly that of Pol, or possibly of two, but distinction between them is difficult. To the usual elements of a Book of Hours (calendar, hours of the Virgin, etc.), with their traditional illustrations, were added seven episodes from the lives of saints, taken from *The Golden Legend* — namely, SS. Catherine, Gregory, Bruno, Jerome, Paul the Hermit, Anthony Abbot, and John the Baptist — as well as the story of the emperor Heraclius. In each of these narratives, illustrated with 2 to 12 miniatures, Pol shows a resourceful imagination and a most unusual sense of documentary detail. His presentation was as factual and historically accurate as he could make it, and the combination of ingenious invention with a degree of realism previously unknown in France foreshadows the

marvelous figures of the *Très Riches Heures du Duc de Berry* and, in some respects, the work of Jean Fouquet (q.v.).

This manuscript demonstrates that the Limbourgs, better than anyone before them, understood the new inventions of Italian origin. The Italian derivation is less significant in iconography — even though certain elements are directly borrowed (e.g., tabernacles with figures above the capitals, as in the Cathedral of Milan; procession of Litanies inspired by paintings such as the *Beheading of St. George* in Padua) — than in the treatment of form and space. The Limbourgs' sense of mass and volume indicates a profound study of the Giottesque tradition. Their distances are developed in plains and hollows and are animated with far-off landscapes and shifting skies. An effort toward a consistent perspective construction becomes apparent, reflecting 20 years of trial and error in the Parisian international milieu and prefiguring pictorial discoveries yet to come. The work also reveals original observation, most likely enriched by familiarity with the large collections of Jean de Berry, which are known to have included a wealth of Italian art, paintings, sculpture, furniture, and medals. The *Belles Heures* was acquired in 1416 by Yolanda of Aragon, duchess of Anjou; rebound about 1620; and found, in the second half of the 19th century, in the possession of the Baron d'Ailly. The manuscript passed to the collection of the Baron Edmond de Rothschild, and then, in 1954, to the Metropolitan Museum, New York; it is exhibited in The Cloisters.

One surviving copy of a *Bible moralisée* (Paris, Bib. Nat., Ms. fr. 166), illuminated during the time of the French king Charles VI (1380–1422), was begun by the Limbourgs, no doubt at about the same time as they were working on the *Belles Heures du Duc de Berry* — a deduction justified by the close relationship of the two manuscripts (which makes it unlikely that this was the work commissioned by Philip the Bold). If the Bible was, indeed, intended for Jean de Berry, its omission from the inventories of his library may perhaps be attributed to the fact that it was too incomplete to deserve mention. After the death of the Limbourgs the Bible was continued by various painters, including the Master of Juvénal des Ursins (Master of the Geneva Boccaccio) and other less able artists, who worked on it until the end of the 15th century, but it remained unfinished.

The work of three hands, very close but nevertheless distinct, can be recognized in the decoration of the first three gatherings of the *Bible moralisée*, which were divided among the brothers. The miniatures in the third gathering (fol. 17–24), because of their superiority, may be attributed to Pol, after which follow in order of excellence the first gathering (fol. 1–8) and then the second (fol. 9–16).

The frontispiece, which appears to have been added to the Bible, is contemporaneous in execution and is undoubtedly the work of one of the brothers. This full-page miniature shows St. Jerome, seated at his desk among his books, translating the Bible; his lion is in front of him and his cardinal's hat hangs on the wall. Simpler versions of the same scene are to be found in the *Belles Heures du Duc de Berry* (fol. 187v) and in the initial letter of a Valerius Maximus manuscript in the Vatican Library (Reg. lat. 939), also by the Limbourgs, the text of which was written in Paris by an Italian about 1410; and there are two drawings of it. One of the drawings, in Paris (Louvre, Cabinet des Dessins, RF 423), is very close to that of the Limbourgs but less polished; the other, in Rotterdam (Mus. Boymans–Van Beuningen, Königs Coll.), which contains only the seat and architectural decoration, is no doubt from the Limbourgs' atelier. The theme stems ultimately from Carolingian Evangelist portraits, which were themselves derived from antique author portraits. It reached France from Italy, as witness the portrait of Petrarch in a copy of *De viris illustribus* (Darmstadt, Landesbib., Cod. 101), drawn about 1380, which is comparable in every respect, save that it is surrounded by Italian architectural decoration and furniture, perhaps reproducing a lost mural from the Hall of the Giants (Sala Virorum Illustrium) in the Carrara Palace in Padua. Like the Darmstadt portrait, that of the *Bible moralisée*, completed down to every detail, was intended as a grisaille. The connection with Padua is probably more than coincidental, for it appears also in the Litanies of the *Belles Heures du Duc de Berry*.

The illustration of a luxurious *Book of Hours of Rome Use*, in the possession of Count Antoine Seilern, London (formerly, James de Rothschild Coll.), can without doubt be attributed to one of the Limbourgs, possibly the artist of the second gathering of the *Bible moralisée*, and was painted between 1413 and 1416. It is not known for whom this manuscript was destined, for it contains no coat of arms, nor is it mentioned in the posthumous inventory of Jean de Berry. Unfinished at the death of the Limbourgs, the manuscript was completed by the master who had also been the final contributor to the Brussels *Très Belles Heures*. Apart from the added section, the illustrations are as homogeneous as those of the *Belles Heures du Duc de Berry* and are composed of 5 small (one-third of a column) and 18 full-page miniatures. The work is placed chronologically between the New York *Belles Heures* and the *Très Riches Heures* and marks a distinct stylistic phase between the two. The images are of the traditional type represented in the former, some features of which are closely reproduced. For example, the *Belles Heures* scene (fol. 94v) from the life of St. Bruno, with Raymond Diocrès emerging from his coffin, occurs again in the Seilern Hours (Office of the Dead, fol. 81v), repeating the poses of the frightened monks and the architecture and furnishings, and though Diocrès is absent, it is still an obvious example of copying. The frames of the miniatures are of two types, comprising, like those of the *Très Riches Heures*, an Italian acanthus pattern filled with figures and naturalistically rendered flowers.

Shortly after finishing the *Belles Heures du Duc de Berry*, the Limbourg brothers began the decoration of the manuscript listed in the 1416 inventory as the "très riches heures" (*Très Riches Heures du Duc de Berry*; Chantilly, Mus. Condé, Ms. 65), the second of their works that can be dated with precision and the masterpiece of French International Gothic style. Left unfinished at the death of the Limbourgs, it was completed about 1485 by Jean Colombe of Bourges for Charles I of Savoy and his wife, Blanche of Montferrat, distant cousins descended from Bonne de Berry, the daughter of Jean. The volume contains 129 miniatures, some full-page or three-quarters of a page in two columns, and some smaller, one-third or two-thirds of a page in one column. Of these, 71 were by the Limbourgs, and the rest, some already begun by the brothers, were completed by Colombe.

The pictorial program goes far beyond that of the *Grandes Heures du Duc de Berry* (X, PL. 440; Paris, Bib. Nat., Ms. lat. 919) illustrated by Jacquemart de Hesdin for the same patron. Just as the content of the *Grandes Heures* was complementary to the *Petites Heures* of Jean de Berry (Paris, Bib. Nat., Ms. lat. 18014), so the *Très Riches Heures* complements the *Belles Heures* in a way that indicates for both pairs of manuscripts the editorial assistance of specialists and the preference of the patron himself. The *Très Riches Heures* opens with the usual 12 figures of the calendar, but whereas in the *Belles Heures* these labors of the months conform to traditional themes, here the artist has animated them by providing a realistic and lively setting (VI, PL. 65). In the January page (PL. 137) Jean de Berry personally receives his household for the New Year's dinner. The physical appearance of the duke matches the features on his funeral effigy; the other figures surely must be portraits also. Scenes for other months show a gathering of elegant young people for a rustic betrothal, a May promenade, a hunt, and alert peasants and fresh-faced yeomen laboring in the fields of the prince with one of his châteaux in the background (PL. 8). In the December scene (PL. 138) night falls on an autumnal clearing where a stag lies dead after the hunt. In the background, lit by the last rays of the sun, are seen the high towers of the castle of Vincennes, where Jean de Berry had been born. This dreamlike apparition, so soon to vanish in the night, this recollection of a distant past in the melancholy atmosphere of the closing day and the dying year, evokes in naturalistic terms the idea of death and of man's final end. The painter had found the principal motif (the dogs with their quarry) in some album

such as the sketchbook of Giovannino de' Grassi (Bergamo, Bib. Civ., Cod. VII, 14), but the setting in which it is employed in the Jean de Berry calendar envelops the Italian motif in a fairy-tale atmosphere; the real has been transmuted to fantasy.

Precise observers of natural landscape forms, the Limbourgs established a mystic correspondence between the physical universe and the world of the spirit. Far from abstracting forms of nature to reveal their hidden content, they scrutinized the ways of nature to find the revelation of a higher order. The *Coronation of the Virgin* is equally revealing of their poetic genius. The composition, rounded at the bottom in double curves, rises, expands, and melts into the gold and the azure, like a cloud that dissipates the light and the celestial glow. Everything in this ascending rhythm magnifies the glory of the Virgin, but the idea is expressed by representational means, without any tendency toward stylization or abstraction. Similarly, in the glowing red scene of Hell a jet of flame and smoke ceaselessly spews forth the souls of the damned from the gridiron of Lucifer and drops them back again into the volcano of fire. It is a terrifying scene over which hovers the eternity of punishment.

The meticulous documentation — of the local color, for example — appears even more clearly in this manuscript than in the *Belles Heures*. Antiquity, real or imagined, and Italy were again important sources of inspiration. The kneeling Adam in the *Eden and the Expulsion* (PL. 139) has close affinities with an ancient statue of the Pergamene school, of which a copy can be found in Aix-en-Provence (Mus. Granet). Medallions of Heraclius and Constantine, which the duke, believing them to be ancient, had purchased from Italian merchants in 1402, served as models for one of the horsemen of *The Meeting of the Three Kings* (PL. 140) and for the solar chariot of the calendar. (The medallion of Constantine had already been used as a source for the *Belles Heures*.) *The Purification* (fol. 54v) was inspired by a scene similar to *The Presentation of the Virgin in the Temple* by Taddeo Gaddi in Florence (Sta Croce, Baroncelli Chapel).

In the 18th century the *Très Riches Heures* was owned by the Spinola family of Genoa, then by the Serra family, and finally by Baron Felix de Margherita of Turin, who sold it in 1856 to the Duc d'Aumale. The duke bequeathed his collection to the Institut de France.

It is difficult to date with precision several minor works of the Limbourg brothers. One is an excellent *Departure of Jean de Berry on a Journey*, perhaps contemporary with the *Belles Heures du Duc de Berry*, inserted in the *Petites Heures du Duc de Berry* (Paris, Bib. Nat., Ms. lat. 18014, fol. 288v) at the beginning of the prayer "ad capiendam viam suam." As obvious flattery, it makes use of the figure of the guardian angel of the Holy Family from the *Flight into Egypt* (fol. 63) in the *Belles Heures* manuscript. Others are two scenes with rather heavy figures (*Adoration of the Trinity* and *Prayer to the Angels*) that were added to the *Très Belles Heures de Notre-Dame* (Paris, Bib. Nat., Nouv. acq. lat. 3093, pp. 225 and 240; formerly Rothschild Coll.), once the property of Jean de Berry. Finally, the author portrait in the Valerius Maximus manuscript in the Vatican (mentioned above) seems to be a work of commercial character and probably antedates the Limbourgs' entry into the service of Jean de Berry. To the foregoing may be added the initial of a Consecratory Charter of the Ste-Chapelle of Bourges, dated Apr. 18, 1405; since this is known only by a reproduction (A. de Bastard, *Documents manuscrits*, Paris, 1838–69, XII), it is difficult to be sure that it is not a later copy or even whether it is by one of the Limbourgs.

To one of the brothers or their circle, Erwin Panofsky has attributed a *Portrait of a Lady* (Washington, D.C., Nat. Gall.), as well as the original of a profile portrait of John the Fearless known through a copy in the Louvre. Other works have been attributed to them without valid reason. Certainly the marginal decorations of the *Book of Hours* in Oxford (Bodleian Lib., Ms. Douce 144), the paintings in the *Book of Hours of Rome Use* (Br. Mus., Ms. Add. 35311 and Ms. Harley 2897) should not be ascribed to them. More problematic is the beautiful *Madonna of Humility* in the Prayer Book of Philip the Bold (Brussels, Bib. Roy, Ms. 11035–37, fol. 6v; cf. C. Gaspar and F. Lyna, *Les principaux manuscrits à peintures de la Bibliothèque royale*, Paris, 1937, I, pp. 419–23 and pl. XCVIIIa). On the other hand, the *Book of Hours of Paris Use* in Chantilly (Mus. Condé, Ms. 66) is very close to the Seilern Hours.

The brevity of the Limbourgs' career explains not only why we have so few works by them but also the isolation of their position. They were in advance of their time, and their activity, although fairly well documented, became known only slowly and fitfully, at least in France (perhaps because of the historical crises of the times). Their work represents a crucial stage in the development of European art just prior to the Van Eyck brothers (see EYCK), but it is difficult to determine the extent to which these artists, of such boundless curiosity and remarkable sensitivity, can be regarded as innovators and to what extent they adopted the art forms of their own times. The admiration which they aroused is seen in the large number of imitations of their figured scenes in French illuminations. The *Belles Heures du Duc de Berry* furnished a number of themes for the Rohan Hours (Paris, Bib. Nat., Ms. lat. 9471), painted for a member of the Anjou family between 1418 and 1425; for the *Book of Hours of René of Anjou* (Paris, Bib. Nat., Ms. lat. 1156A); and for the *Hours of Angers Use*, formerly in the collection of Martin le Roy (Paris, private coll.). The decoration of the Breviary of John the Fearless included certain motifs derived from the Limbourgs, as did the Oxford Hours and some drawings added, perhaps about 1420, to the Psalter of Henry VI (Br. Mus., Ms. Cotton Domitian A.XVII). Other imitations of the Limbourgs' work — in a *Bible historiale* in Chantilly (Mus. Condé, Ms. 28) and in the Hours of Marguerite d'Orléans (Paris, Bib. Nat., Ms. lat. 1156B) — show the continuing prestige of their style. Finally, the calendar of the *Très Riches Heures du Duc de Berry* served as a model for the famous late 15th- or 16th-century manuscript, the Grimani Breviary (PL. 138; X, PL. 80; Venice, Bib. Marciana, Ms. s.s.), as well as for works of a comparable nature decorated by Flemish painters.

LIPCHITZ, JACQUES (Lipschitz). Sculptor (b. Druskieniki, Lithuania, Aug. 22, 1891). Son of a Jewish building contractor, Jacques Lipchitz after a routine schooling in various Lithuanian cities went to Paris in 1909, a trip opposed by his father but aided by his mother. There he sought formal training in sculpture, briefly at the Ecole des Beaux-Arts, then at the Académie Julian. His early work includes some portrait heads modeled in clay (1910–11) and a rather academic *Woman and Gazelles* (1912). In 1913 he exhibited several small, dynamically posed and geometrically stylized plaster groups (later cast in bronze), such as *Acrobat on Horseback* and *Woman with Serpent*, perhaps influenced by current sculpture of Ar-

chipenko and Duchamp-Villon. In *Sailor and Guitar* (1914) he introduced the flat, overlapping planes of cubist painting. This was followed by a series of severely geometric marionettes, composed of silhouetted, flat wooden panels assembled with dowels, somewhat resembling collage. To the same period (1915–17) belong several bold and austere abstracts in stone, such as *Man with Guitar* (New York, Mus. of Mod. Art). These mark his emergence as a significant modern sculptor and cubist. In addition to many rather large figures of interwoven angular planes (e.g., *Bathers* and *Harlequins*, 1917–19) like the paintings of hermetic cubism, he also executed several reliefs of musical instruments. (Some of these are on the exterior walls of the Barnes Foundation, Merion, Pa.) In the 1920s, after a brief return to portraits (*Gertrude Stein*, *Berthe Lipchitz*), his cubist figures became more curvilinear. Also, for the first time, he executed life-sized sculpture (*Bather*, 1923–25). Experimenting with the lost-wax technique, he produced a group of small bronze "transparents" (1926–28), so called because of the interplay of solids and voids, some like cardboard cutouts, others like drawings in thick wire. Similar spatial interpenetrations appeared in his larger works such as *La Joie de Vivre* (1927) and *Reclining Nude with Guitar* (1928). One of the most powerful is the totemlike *Figure* (1930; New York, Mus. of Mod. Art).

In the 1930s there occurred a major change both in his subject matter and his style. In place of the impersonal and cubist *Harlequins* and *Bathers*, he turned to subjects which were based on personal experience but which had allegorical or symbolic overtones, such as *Mother and Child* (1930) and *Return of the Prodigal* (1931). His figural style was based on a simplified and enlarged naturalism, probably influenced by Picasso's surrealist figures. He also began to acknowledge a great respect for Rodin, whose work he had previously disliked. One of his most beautiful works of this period is the large *Song of the Vowels*, a blend of ambivalent symbolism and broad cubist forms. Profoundly disturbed by the threatening political events of the 1930s, Lipchitz produced *Prometheus Strangling the Vulture*, a huge allegorical group, commissioned for the Paris Exposition Universelle of 1937, and a more modest but equally forceful *Rape of Europa* (IV, PL. 184). During World War II, Lipchitz escaped to New York, where in the next few years, from 1941 to 1948, he produced some of the most dramatic sculptures of his career: *Mother and Child II*, *Benediction*, the "Sacrifice" series (I, PL. 131), and a revised version of the monumental *Prometheus* (one example of which is in the Philadelphia Museum of Art, another at the Walker Art Center, Minneapolis). A second series of "transparents" (*Blossoming*, *Springtime*) is romantic and lyrical in theme and execution. One of the most important commissions of his later career was the large *Notre Dame de Liesse* for the little church of Assy, near Mont Blanc, begun in 1948 and finally installed in 1954. (Other examples are at Iona, Inner Hebrides, and in New Harmony, Ind.) His New York studio destroyed by fire in January, 1952, he built a new studio near his home in Hastings-on-Hudson. His subsequent work has been limited mostly to small sketches, a few portraits, and an interesting series based on "found objects."

LIPPI, FILIPPO AND FILIPPINO. Painters, father and son, among the most interesting and significant personalities of the Florentine Quattrocento.

SUMMARY. Filippo (col. 257). Filippino (col. 261).

FILIPPO. Filippo Lippi was born in Florence about 1406 and died at Spoleto in 1469. In 1421 he took the vows of a Carmelite monk in the monastery of S. Maria del Carmine, Florence, where he remained for over ten years. In 1432 he executed the fresco *The Reform of the Carmelite Rule* (PL. 141), after which he probably left the monastery, since its records no longer mention him after Jan. 1, 1433. In 1434 he worked in the Basilica of S. Antonio in Padua and the Cappella del Podestà of the same city; his paintings in Padua have not survived. The *Madonna and Child* (PL. 143), formerly in the museum in Tarquinia (now Rome, Gall. Naz.), is dated 1437. In the same year the *capitani* of Orsanmichele commissioned him to paint a panel for the Barbadori Chapel in Sto Spirito, Florence (Louvre). It is this work to which Domenico Veneziano alludes in his letter of Apr. 1, 1438, to Piero di Cosimo de' Medici, declaring Filippo to be a "good master," together with Fra Angelico. The *Coronation of the Virgin* (PL. 142) in the Uffizi, commissioned by Canon Francesco di Antonio Maringhi, seems to have been begun in July, 1441, and the final payments were made only in 1447, in which year Filippo's painting *St. Bernard's Vision of the Virgin*, formerly in the Palazzo della Signoria (London, Nat. Gall.), was also completed. In 1450 Fra Filippo was accused and convicted of having falsified a receipt for a sum of money to be paid to the painter Giovanni di Francesco. In April, 1452, the *provveditori* of the Cathedral of Prato invited him to decorate the choir of the Cathedral, on which he began work the following month, together with his assistant, Fra Diamante di Feo da Terranova. This work continued, with many suspensions, until 1464.

In 1452, Fra Filippo was named chaplain to the nuns of S. Niccolò de' Frieri in Florence and painted for Leonardo di Bartolommeo Bartolini a tondo, the Madonna with scenes from the life of the Virgin (PL. 144) now in the Pitti. *The Virgin Enthroned and Two Saints* in the Galleria Comunale at Prato is dated 1453, and *The Adoration of the Child* for the convent of Annalena (Uffizi, No. 8350) was finished about 1455. In May, 1455, Fra Filippo was relieved of his duties as rector of the Church of S. Quirico at Legnaia, near Florence. In the following year, however, he was named chaplain to the nuns of S. Margherita at Prato; it was from this sisterhood that he induced the nun Lucrezia Buti to elope with him. About 1457 Lucrezia bore him a son, Filippo, known as Filippino (see below). In 1458 Fra Filippo was commissioned by the Compagnia della SS. Trinità of Pistoia to complete an altarpiece of the Trinity which Francesco Pesellino had left unfinished at his death; this work (London, Nat. Gall.) was finished by Lippi in 1460. In 1461 the *Ufficiali di Notte e Monasteri* of Florence accused Fra Filippo and a notary of Prato of immoral behavior: Lucrezia Buti and her sister Spinetta, although they had renewed their nuns' vows in 1459, were once again living with the painter. Through the intercession of the Medici, Pius II released Fra Filippo and Lucrezia from their vows, and they were thenceforth recognized as man and wife. About 1463 Filippo painted an *Adoration of the Child* (Uffizi) for Lucrezia Tornabuoni. In 1466 he received the first payments for his frescoes in the apse of the Cathedral of Spoleto. While engaged on these frescoes, the painter fell ill and died in 1469 — on October 8, according to the necrology of the Carmine; on October 10, according to the notarial archives of Spoleto.

Fra Filippo Lippi, who lived in the monastery of the Carmine from 1421 to 1432, undoubtedly saw Masaccio and Masolino at work on the frescoes in the Brancacci Chapel of the monastery church. This experience was of first importance in his artistic formation, as the *Reform of the Carmelite Rule* in the cloister and the contemporaneous *Madonna of Humility* (Milan, Mus. del Castello Sforzesco) attest. In these works we may note a powerful striving for plasticity that derives directly from Masaccio and, at the same time, an attempt to incorporate the clear, pure colors and abstract diffused luminosity characteristic of Masolino.

Also apparent in Fra Filippo's early works are the influence of both Lorenzo Monaco, who had decorated the Bartolini Chapel in Sta Trinita, and Gherardo Starnina, who had worked at the Carmine itself, in the Chapel of St. Jerome. Other works which have been attributed to this phase of Fra Filippo's activity (ca. 1432) include the *Madonna with Saints and Angels* of the Galleria della Collegiata in Empoli, that in the Cini Collection, Venice, and the little *Madonna with Saints* in the

Musée Condé at Chantilly (also attributed to Francesco Pesellino).

After this period the next extant works of the painter are the above-mentioned *Madonna and Child* ("The Tarquinia Madonna"; PL. 143) and other paintings executed between 1437 and 1440. During the intervening years occurred Fra Filippo's Paduan sojourn, from which no works have survived; traces of it, however, are perhaps discernible in the "Tarquinia Madonna," particularly in its color: arbitrary and unusual juxtapositions of dark, hard, almost stony hues that remain unaffected by the surrounding light and have nothing in common with the transparent late-Gothic tonalities of Lippi's pre-Paduan paintings. This change of key, which is generally explained in terms of influences from Lorenzo Monaco, is more probably related to the dark tonalities common in the late-Gothic painting of the Veneto. Among the works associated with the "Tarquinia Madonna" and the period 1437–40 are the *Madonna and Child with Angels and Saints* (XII, PL. 35) formerly in Sto Spirito (Louvre) and its predella (Uffizi); the *Madonna and Child Enthroned* (New York, Met. Mus.) with the two pairs of saints (Turin, Gall. dell'Acc. Albertina) that originally formed a single triptych; and the *Annunciation* in S. Lorenzo, Florence, in which the influences of Paolo Uccello and Donatello are apparent.

The paintings of 1437–40 show a dominant interest in volume, combined with an unusual feeling for the changing play of light over surfaces and an insistence on flowing line. These are the first indications of a departure from the monumental stasis of Masaccio, which became final in Filippo's *Coronation of the Virgin* (PL. 142), executed about 1441–47. In this complex work the thronged figures are disposed symmetrically, one next to the other, about the central group; but the somewhat archaic composition is rendered fresh and immediate by the action of the light which flows over the figures, modifying form and color alike and overcoming any impression of immobility. The value of light is reinforced by that of line, which takes precedence over modeling: a freely flowing, insistent line, well adapted in its decorative character to a sense of space quite foreign to the laws of Brunelleschi.

The Uffizi *Coronation of the Virgin* thus is linked with Filippo's preceding works of 1437–40 and with his works of the 1450s and '60s, rather than with those of the decade of the 1440s, during which it actually was painted. This anomaly indicates that the changing interest of the artist was directed toward other experiments, marking a parenthesis in the natural evolution of his style. Shortly after 1440 Filippo participated in a classicist episode of taste shared by many of the Florentine painters and sculptors of that time. The interest in effects of pure plasticity aroused by Masaccio's works in the 1420s and '30s now gave place to investigations of spatial effects. These investigations — initiated by painters of refined intellect who had arrived at the Renaissance by way of a Gothic education, such as Paolo Uccello and Domenico Veneziano — were taken up by Filippo in the *Virgin Enthroned* formerly in Sta Croce (Uffizi) and the *Virgin and Child* in the Museo Mediceo, Florence, both seemingly painted between 1440 and 1442.

Certain paintings which form a distinct group may be dated between 1442 and 1447: the *Annunciation* in the Galleria Nazionale in Rome, the *Coronation of the Virgin* in the Vatican Museums, the Alessandri altarpiece (New York, Met. Mus.), the *Annunciation* (Munich, Alte Pin.), the *Adoration of the Magi* in the National Gallery, Washington, D.C. (PL. 146), and *St. Bernard's Vision of the Virgin* (London, Nat. Gall.). In these paintings it is clear that Filippo was influenced in the early 1440s by Fra Angelico, from whom he adopted bright, unshaded colors, a decorative line, and an ecstatic sentiment. He did not, however, construct his figures with the light but firm geometric regularity of the older painter; rather, he posed them in attitudes and movements of levity that dispel any sense of mystic contemplation.

After this Angelican interlude Filippo returned to his more customary style in the Madonna and Child with scenes from the life of the Virgin (PL. 144), which, although quite dissimilar in other respects, is directly related to the Uffizi *Coronation of the Virgin* in its intensified linear sensibility and in the harmony of delicate colors infused with light. Close to this singular painting are *The Death of St. Jerome* in the Cathedral of Prato (of which only the lower half is by Filippo, the upper being the work of Fra Diamante) and *The Adoration of the Child* (Uffizi, No. 8350), the earliest of three paintings of this subject, in which suggestions of Angelico are still present in the figure of the Madonna and in the angels.

These paintings date from about 1452, the year in which Filippo began the decoration of the apse of Prato Cathedral, and they reveal a close stylistic connection, not so much with the broadly conceived *Evangelists* (almost in the manner of Andrea del Castagno) in the vault as with the scenes from the lives of John the Baptist and St. Stephen in the choir. The Prato frescoes represent Filippo's most ambitious undertaking, and the problems intrinsic to them are solved with indisputable mastery. Their visual coherence, achieved through a consistent emphasis on line and light, is coupled with a subtle emotional coherence by virtue of which the figures' every state of being is infused with thoughtful melancholy. The scenes representing St. John in the wilderness still seem oriented toward a late-Gothic world, recalling 14th-century representations of the Thebaid (e.g., PL. 7). *The Funeral of St. Stephen* (PL. 145), on the other hand, which an inscription dates as from 1460, following a sojourn in Florence (1457–58), places Filippo definitely in the Renaissance. The ample figures are placed within a spacious, columned interior pervaded with silvery light, against which their own warm colors stand out strongly. Red is used throughout with such freedom and exuberance as to heighten the modeling and vividness of the figures, many of which are portraits. *Herod's Feast* (PL. 145) lacks the solemn spatial equilibrium of *The Funeral of St. Stephen*, but its use of vibrating light and of a free, rhythmic line anticipates the art of Botticelli and even that of Leonardo.

The other autograph works of the late 1450s were executed in Florence, among them the polyptych painted for Alfonso II of Naples; its two surviving lateral panels, *St. Michael* and *St. Anthony*, were formerly in the Cook Collection at Richmond, England. From the late 1450s and early 1460s come the *Madonna Adoring the Child* in Berlin (PL. 146) and the *Annunciation* and *Seven Saints* painted for the Medici (London, Nat. Gall.). The personal characteristics of the master's late style find their quintessential expression, however, in the famous *Madonna and Child with Angels* in the Uffizi, from which the less successful *Madonna and Child* in Munich (Alte Pin.) derives.

Fra Filippo's artistic activity was concluded with the frescoes in Spoleto Cathedral, executed between 1467 and 1469, depicting scenes from the life of the Virgin (PL. 146). Much of the work on these frescoes he delegated to his collaborator, Fra Diamante. Nevertheless, certain of the autograph sections prefigure, still more clearly than the frescoes in Prato Cathedral, the future development of Florentine painting in the hands of Botticelli and of Filippino Lippi. Of all the Florentine Quattrocento painters, Fra Filippo Lippi can undoubtedly be considered one of the richest in creative possibilities.

An early evaluation of Filippo is that in the letter mentioned above from Domenico Veneziano to Piero di Cosimo de' Medici, dated Apr. 1, 1438: ". . . there are good masters like Fra Filippo and Fra Giovanni [i.e., Fra Angelico] who have much work to do . . . ." Thus even at that date Filippo was considered the equal of Angelico. Another citation occurs in the *Apologia* prefixed to Cristoforo Landino's 1481 edition of Dante, in which Fra Filippo was named as one of Florence's illustrious artists. He was also mentioned among the outstanding Florentines by Antonio Manetti (*Le Vite di XIV uomini singhulari*), by Antonio Belli in his *Libro*, and by Francesco Albertini in his *Memoriale* . . . (1510). All call his work skillful (*artifitioso*), beautiful (*hornato*), and varied in coloring. These writers furnish the nucleus for a catalogue of Filippo's works.

The first biography of the artist is Vasari's. It seems to contain a sizable admixture of fiction, especially in the expanded second edition of the *Lives* (1568), but it includes an extensive list of paintings, as well as valuable information on Filippo's formative period with his study of Masaccio's works at the Car-

mine. Vasari's assessment of Filippo's artistic personality, though rather general, is repeated by Borghini (1584) and Baldinucci (1681–1728). Luigi Lanzi (1789) also accepts, with some reservations, Vasari's critical estimate and his biographical data.

The first notable critical discussion of Filippo is supplied by Jakob Burckhardt (1855), who emphasizes both the creative originality of the painter's imagination and his importance as an innovator, though an innovator who built upon the contributions of the past. Somewhat later, Alexis François Rio (1861), scandalized by the behavior of the man, condemned the painter as lacking in those qualities which the portrayal of sacred subjects requires.

A similar moralistic prejudice is discernible in J. A. Crowe and G. B. Cavalcaselle's *New History of Painting in Italy*; they are disinclined to accept Vasari's account of the relationship between Fra Filippo and Lucrezia Buti and regard his art as deriving more directly from Fra Angelico and Masolino than from Masaccio. Nevertheless, Cavalcaselle's chapter on Filippo — carefully documented and not without valuable new ideas, such as the influence of Donatello on the painter — was an important contribution to our knowledge.

Berenson, in 1896, considered Fra Filippo "a high-class illustrator." This judgment is perhaps in part a corollary to the moral prejudice of the period, which paid more attention to the artist's amorous adventures than to his art.

The first monograph on Fra Filippo, by Igino Benvenuto Supino, appeared in 1902. Serious and conscientiously informative, it made some important documentary contributions. On a higher interpretive level was the monograph by Henriette Mendelsohn (1909), notable for the accuracy of its attributions, for its investigation of problems of collaboration (not infrequently present in Fra Filippo's work), and for the consequent revision and augmentation of the catalogue.

Adolfo Venturi's consideration of Fra Filippo in his *Storia dell'arte italiana* is explicitly based on Mendelsohn's book. Venturi, starting with the presupposition of a collaboration between Fra Filippo and Fra Angelico in the Washington *Adoration of the Magi*, postulated a straight-line development for the master, from Gothic to Renaissance, reiterating that concept of stylistic coherence to which so many 19th-century art historians were attached. Especially impressive, for Venturi, were Fra Filippo's inventive freedom and the reconciliation he often accomplished between the aspirations of Fra Angelico and those of Masaccio.

It was Berenson, in 1932, who took the next important step forward in the criticism of Filippo's work. He proposed that the Masaccio phase of the artist's activity was the initial one, not a later episode; that Masaccio's influence, supplemented by other stimuli, continued to be important until about 1442; that just when Fra Filippo was integrating these influences into a coherent personal style, he entered into collaboration with Fra Angelico on the Washington *Adoration of the Magi* and as a consequence took over features from that master's style, not unconsciously and occasionally as he had previously done, but deliberately and systematically; and that after some years in this vein, he returned to his natural style, which culminated between 1452 and 1464 in the frescoes at Prato.

Berenson's thesis, generally accepted, inspired a sudden upsurge in Lippi studies, particularly in 1936, when it was discussed, refined, and made more exact by such scholars as Mario Salmi, Giuseppe Fiocco, Giovanni Poggi, and, most importantly, Georg Pudelko. This view of Fra Filippo's artistic evolution was also fundamental to the monographs of Robert Oertel (1942), André Chastel (1948), and Mary Pittaluga (1949), each of whom added his own deductions, insights, and interpretations.

FILIPPINO. The painter was born at Prato about 1457, the son of Fra Filippo Lippi and Lucrezia Buti, and died in Florence on Apr. 18, 1504. From 1467 through 1469 he was in Spoleto with his father and in 1469, after Filippo's death, received grants in the form of gifts from the Cathedral chapel there. In 1472 he is described in the *Libro Rosso* of the Compagnia di San Luca in Florence as "painter with Sandro Botticelli." In 1482 the Signoria of Florence assigned to him the decoration of a wall in the Palazzo Vecchio, which was never executed, and in 1483 the town of San Gimignano commissioned the *Annunciation* (in two tondos) which, probably finished in the 1490s, is now in the Pinacoteca at San Gimignano. Probably between 1481 and 1483 Filippino worked on the scenes from the life of St. Peter in the Brancacci Chapel of S. Maria del Carmine in Florence, completing the fresco cycle begun by Masolino and Masaccio. The *Madonna Enthroned with SS. John the Baptist, Victor, Bernard, and Zenobius* (PL. 147), painted for the Sala degli Otto di Pratica in the Palazzo Vecchio, dates from 1485. About 1486 Piero di Francesco del Pugliese commissioned Filippino to paint *The Vision of St. Bernard* (PL. 149) for the monastery of the Campora (near Porta Romana, Florence), and in 1487 Filippo Strozzi entrusted him with the fresco decoration of the family chapel in S. Maria Novella, which he completed in 1502. In 1488 he was called to Rome by Cardinal Oliviero Carafa to decorate the Carafa Chapel in S. Maria sopra Minerva; these frescoes were completed, and Filippino returned to Florence between 1489 and 1493. We know also that before September of 1488 Filippino painted two pictures, now lost, for King Matthias Corvinus of Hungary. In 1491 he presented a design in competition for the façade of the Cathedral of Florence. The *Christ Appearing to the Virgin* in the Alte Pinakothek at Munich was finished in 1495. From 1496 until the painter's death in 1504 there is a series of dated pictures comprising *The Adoration of the Magi* for S. Donato a Scopeto (Uffizi, 1496); *The Meeting of Joachim and Anna* (Copenhagen, Statens Museum for Kunst; 1497); the tabernacle containing a *Madonna and Saints* painted for his mother's house on Canto del Mercatale in Prato (Prato, Gall. Comunale; 1498; reconstructed from fragments after World War II); *The Mystic Marriage of St. Catherine* (Bologna, S. Domenico; 1501); the *Madonna with Saints* in the Galleria Comunale of Prato (1503); and the St. Sebastian altarpiece for the Church of S. Teodoro in Genoa (Genoa, Palazzo Bianco; 1503). In 1503 Filippino also began the *Deposition* (Florence, Accademia) for the high altar of SS. Annunziata in Florence, but he died before being able to finish it and it was completed by Perugino.

Filippino Lippi's earliest documented paintings date from 1483. Reconstructions of his prior activity are therefore somewhat conjectural. The Accademia in Florence contains an *Annunciation* generally attributed to the Master of the Castello Nativity, in which Filippino may have had some part about 1475. Attributable to Filippino in the years 1475–80 are most of the paintings given by Berenson in 1899 to an artist he called "Amico di Sandro" and subsequently reattributed to Filippino by Berenson and others. Among these are *Five Female Allegorical Figures* (Florence, Coll. Corsini); *The Madonna and Child with St. Anthony of Padua and a Monk* (Budapest, Mus. of Fine Arts); a *Madonna* (Berlin, Staat. Mus.); *The Virgin and Child with St. John* (London, Nat. Gall.); *The Adoration of the Kings* (London, Nat. Gall.); *Scenes from the Story of Lucretia* (Florence, Pitti; PL. 147); *The Story of Virginia* (Louvre); *The Story of Esther* (divided among Chantilly, Mus. Condé; Paris, Coll. Comtesse de Vogüé; Vaduz, Liechtenstein Coll.; and Florence, Fondazione Horne); *The Adoration of the Child* (Uffizi, No. 3249); and *Tobias and the Three Angels* (Turin, Gall. Sabauda).

Such productions must have been well received by the Florentines, since in the early 1480s they entrusted the young painter with the task of completing the fresco cycle of the life of St. Peter in the Brancacci Chapel. In these paintings in the Carmine Filippino's style takes on a breadth quite unknown in the preceding works. The decorative line that associates them with Botticelli and Fra Filippo is here functionally integrated with the representation of mass. An exception is the fresco depicting St. Peter's liberation from prison, clearly Botticellian in character.

The Masaccio phase of Filippino's style is confined exclusively to the Brancacci frescoes. In the contemporaneous *Madonna Enthroned with SS. John the Baptist, Victor, Bernard, and Zenobius* (PL. 147) Filippino took up his accustomed manner with a new security and decisiveness. There are suggestions of Botticelli and even of the young Leonardo in this picture.

For the first time in Filippino's *œuvre*, Flemish influences — already well assimilated — make their appearance in *The Vision of St. Bernard* (PL. 149), one of the artist's most notable achievements. They are evident particularly in the realm of color. The rather complex composition involves a singular landscape where, in an atmosphere filled with blue-gray-green reflections, one sees an unreal monastic life set amid the rocks that improbably overhang the two principal figures. The saint, of whom there is a drawing in the Uffizi (No. 129E), still recalls Botticelli, but the drapery no longer accompanies the movement of the body as Botticelli's would; rather, it forms a separate decorative entity with linear effects that contrast with the static pose of the figure (M. Fossi).

Whether the connection between Botticelli and Filippino is simply the dependence of Filippino on Botticelli or is that of a parallel evolution arising from their common artistic formation under Fra Filippo and their subsequent association, as Supino suggests, one thing is certain: when Filippino went to Rome to decorate the Carafa Chapel, his development took another direction. The *Annunciation* on the chapel altar is still slightly "Florentine," but the wall frescoes of *The Triumph of St. Thomas Aquinas* (PL. 148) exhibit a striving for novelty and grandeur of style. From a drawing in the British Museum it appears that the scenes must originally have had a greater illusion of depth. The fresco has been cut off at the bottom by an alteration in the chapel structure, so that the buildings towering over the figures now seem less distant. The figures themselves are broadly conceived, with strongly characterized features, and ample, swelling drapery. This striving for monumentality, presaging 16th-century aspirations, appears also in *The Assumption* (PL. 148, 150) and *The Crucified Christ Approving St. Thomas's Work*. The frescoes of the Carafa Chapel, so markedly different in style from other Florentine painting of the time, seem to embody the effect on the painter of "the grandeur that was Rome," perhaps reinforced by influences from such sculptors as Antonio Rossellino, Antonio Pollaiuolo, and, especially, Andrea del Verrocchio. Certainly Filippino made extensive use in his Roman works of ornamental motifs from antique monuments — flowers, candelabra, bucrania — which accorded with his decorative sense.

The paintings Filippino executed after his return to Florence continue to bear the stamp of his Roman sojourn. Important among them are *Christ Appearing to the Virgin* (Munich, Alte Pin.), the *Crucifixion* in Berlin (Staat. Mus.) — which must, according to Scharf, have been flanked by the *St. Mary Magdalene* and *St. John* in the Accademia in Florence — *The Adoration of the Magi* in the Uffizi, and *The Meeting of Joachim and Anna* in Copenhagen (Statens Mus. for Kunst). In painting the Uffizi *Adoration of the Magi* (1496; X, PL. 491), Filippino was clearly aware of Leonardo's treatment of the same subject, but this situation (not unusual for Filippino) did not inhibit his creative spontaneity. It seems rather to have opened to him new fields of interest; his composition appears wrapped in a shadowy penumbra that veils the colors and imparts to the figures an evanescent life. The same stylistic character is shared by the altarpiece (*The Virgin and Child with SS. Jerome and Dominic*) of the National Gallery in London. The *Madonna and Saints* from the tabernacle on Canto del Mercatale, Prato, is set apart from these by its return to the slender and fragile forms of Filippino's youth.

The frescoes, *Scenes from the Lives of SS. Philip and John*, in the Strozzi Chapel of S. Maria Novella in Florence constitute the most complex and significant document of Filippino Lippi's latest style. The four patriarchs in the vault appear enlarged, wrapped as they are in voluminous and convoluted drapery, while the scenes of martyrdom and miracle working on the walls below set an uncontrolled abandon in gesture and movement against architecture strangely inspired by the classical world. Striking examples are the disconcerting *Miracle of St. Philip* and the *Resurrection of Drusiana*, in which the figures are as if caught up in a wind that transforms their garments into whirlpools. (There exists a drawing for the latter composition — Uffizi, No. 186E — light and airy, with reminiscences of Leonardo pleasingly reworked.) These late frescoes, in their irregular and restless compositions, their rotary play of lines and planes, their anxious and intense sentiment, embody Filippino's unmistakable personality, which tried without success to escape the limits of his time. The same sense of uncontrolled bizarreness is present in the coeval *Allegory of Music* (Berlin, Staat. Mus.), a work which must have interested Piero di Cosimo.

Other late paintings, aside from the dated works previously mentioned, include *St. Jerome* (Uffizi), *Christ and the Samaritan Woman* and *Noli me tangere* (both Venice, Seminario Patriarcale), and the *Deposition* (Florence, Accademia) finished by Perugino.

Educated as he was in the circle of Fra Filippo Lippi and Botticelli, Filippino naturally relied on line as his primary expressive means. From the first he used it to quite personal ornamental effect, as can be seen with particular clarity in his drawings (PL. 257; IV, PL. 270). When he came into contact with the Roman world, however, the stylistic environment in which he had grown up must have seemed to him inadequate and old-fashioned (as may be noted in the innovations in his Carafa frescoes). Returning to Florence, he looked searchingly at Leonardo and with new eyes at Botticelli, Ghirlandajo, Signorelli, Perugino, at the sculptors, and at the northern painters, such as Hugo van der Goes, whose Gothic intensity of emotion struck a responsive note in his own anxious spirit.

Filippino Lippi's historical position is important in that he was among the first to feel the conflict between the art of his past and the artistic exigencies of his present, even if he never developed means completely adequate to a new expression. It is precisely this precocious sensibility, never completely resolved in art, that gives his painting its particular fascination.

Filippino's reputation through the centuries has been rather modest. The earliest sources are scanty even of factual data: Albertini in his *Memoriale* ... (1510) cites a few paintings without comment, while a more extensive list occurs in the *Libro* of Antonio Billi. Vasari is the first to show a real interest in Filippino: he calls him "a most excellent talent [that produced] very attractive inventions" and praises him for being the first to paint "grotesques that resemble the antique," for the "strange caprices of his invention," and for the recollections in his work of "the ancient things of Rome." Luigi Lanzi, 250 years later, speaks of him without sympathy, and denies that he was the first to depict "grotesques, trophies, weapons taken from the antique." One must go on to Jakob Burckhardt to find a critical, if succinct evaluation: he declares that Filippino excels Botticelli "in imagination, spirituality, and esthetic sense." Cavalcaselle emphasizes the artistic affinity between Botticelli and Filippino and establishes a solid scholarly foundation for our knowledge of the master's activity.

In 1899 Berenson, as mentioned above, isolated a group of paintings attributed by Cavalcaselle and others to the young Filippino and ascribed them to a hypothetical painter whom he named "Amico di Sandro." In 1932, however, he renounced his earlier creation and reattributed most of these paintings to Filippino, thus amplifying and clarifying the artist's *œuvre*. Most important was Berenson's systematic investigation — the first to be undertaken — of Filippino's drawings (in *The Drawings of the Florentine Painters*). His view of Filippino's artistic personality is, by contrast, very limited; he characterizes the artist as a "popularizer" of Botticelli.

The first monographic study of Filippino Lippi was that of Supino (1904), who stressed Filippino's originality by casting doubt on Botticelli's influence and by discounting Leonardo's influence in *The Adoration of the Magi*. In 1911 appeared Adolfo Venturi's chapter on Filippino in the *Storia dell'arte italiana*. Firmly documented and rich in critical perceptions, it points out the artist's salient stylistic characteristics. The monograph of Urbain Mengin (1932) is in the scholarly-descriptive tradition of Supino.

In 1935 appeared Alfred Scharf's fundamental monograph, combining the most rigorous and extensive documentary investigation with an attentive study of the artist's personality. Scharf sees summarized in Filippino's painting all the aspirations of the Florentine Quattrocento: the feeling for nature, the interest in spatial perspective, the delight in effects of line

and color, the striving for characterization of figures, and the cult of the antique (as seen through 15th-century eyes). He also underlines Filippino's importance as a precursor whose innovations interested even Raphael and Michelangelo, and he sees a significant affinity between Filippino's historical position and that of Piero di Cosimo — an affinity apparent also in the drawings, to which Scharf allots a separate chapter. In 1950 Scharf published a second and briefer monograph, incorporating critical contributions (his own among them) of the intervening years. Important among these is the monograph by Katharine Neilson (1938), well informed and containing some notable ideas.

In 1957 Luciano Berti and Umberto Baldini published a monograph on Filippino Lippi that for the first time gave full value to the final phase of the painter's activity (the Strozzi Chapel frescoes), treating it with originality and critical rigor. The same year also produced intelligent essays on the artist by Cesare Brandi, Roberto Salvini, Valerio Mariani, and Giuseppe Fiocco.

LI SSŬ-HSÜN (651–716) **and LI CHAO-TAO** (active ca. 700–40). These two painters, father and son, are traditionally considered to have founded, or greatly developed, a technique of landscape painting known in China as *ch'ing-lü-pai* (blue, green, and white) or *chin-pi shan-shui* (gold and blue-green landscape), which became the basis of the "palace style" in later centuries. No authentic works by either artist have survived, and estimates of their style — in which the son followed the father — are based partly on literary evidence and partly on later paintings that seem to accord with their manner as it is described in early texts.

Li Ssŭ-hsün (personal name Chien-chien) was of noble birth, the grandson of the nephew of the first T'ang emperor. He received his first appointment to the capital about the year 680. However, he soon became involved in a scandal and was exiled to Yang-chou (Yangchow). During the usurpation by the empress Wu (684–705) he resigned from office in protest against her ruthless liquidation of members of the imperial family. The restoration brought him back into favor, and he was rewarded for his loyalty with a fief and a state pension, and was given the honorary rank of general in a guards regiment drawn from the sons of the aristocracy. His son Chao-tao, about whom even less is known, also had a fairly distinguished official career, rising to the rank of Vice-President of the Right Grand Secretariat of the Crown Prince. Li Ssŭ-hsün became known to history as Big General Li (Ta Li Chiang-chün); his son was known as Little General Li (Hsiao Li Chiang-chün), although so far as is known he never held military rank. Three other members of the family were also noted painters in their day. Nothing is known about their work, though it seems likely that they were influenced by the style of Li Ssŭ-hsün.

Early texts contain several stories about Li Ssŭ-hsün's achievements as a painter, but because the events occurred in the reign of Ming-huang (713–56) and also concern the great figure painter Wu Tao-tzŭ (ca. 700–60; q.v.) they probably refer to Li Chao-tao rather than to his father. One story, preserved in the *T'ang-ch'ao ming-hua lu* (Record of Famous Painters of the T'ang Dynasty) by Chu Ching-hsüan (ca. 840–45), relates how, during the T'ien-pao era (742–55), Ming-huang summoned Li Ssŭ-hsün to paint a wall and some screens for the palace at Ta-t'ung (Tatung). Later the emperor said to him, "From the screens that you painted, sir, I have heard the sound of water coming at night. Yours is a mastery that partakes of the divine, and your landscapes take first place in this dynasty."

Another version of this story, in the biography of Wu Tao-tzŭ in the same work, says that both Li and Wu painted landscapes in a hall at Ta-t'ung, Wu in a day, Li taking several months. "Ming-huang's comment was, 'Li Ssŭ-hsün's achievement of many months and Wu Tao-tzŭ's work of a single day — both are excellent in the extreme.' " This is taken as illustrating the contrast between the meticulous craftsmanship of the former and the inspired spontaneity of the latter. The *T'ang-ch'ao ming-hua lu* places Li Ssŭ-hsün in the bottom grade of the Inspired Class and his son Chao-tao one rank lower, in the top grade of the Excellent Class.

The *Li-tai ming-hua chi* (Record of Famous Painters of Successive Dynasties) by Chang Yen-yüan (preface dated 847), the most important, and generally the most reliable, source

for the early history of Chinese painting, states that "the development of landscape painting began with Wu and was perfected by the two Lis." This would of course have been impossible. Wu Tao-tzŭ was about sixteen when Li Ssŭ-hsün died, and Li Chao-tao is more likely to have derived his landscape style from his father than from the great painter of Buddhist and figure subjects. Wu Tao-tzŭ's reputation as a landscape painter rests chiefly upon this one remark by Chang Yen-yüan, who regarded him with much the same unqualified admiration as Vasari regarded Michelangelo.

In the *Li-tai ming-hua chi* the art of Li Ssŭ-hsün is described in flattering, if very general, terms: "In his painting of landscapes or of trees and rocks, his brush style had an intense forcefulness. His rapids seemed really to be running water; his clouds and vapors added a hazy uncertainty. Sometimes when one looks at [his painting on] the theme of Taoist Immortals, [one senses] dimly all the mystery of cliffs and ranges." He is highly praised in the *T'ang-chao ming-hua lu*: "Ssŭ-hsün's style was lofty and original, and his landscapes were supremely excellent. Birds and beasts, or plants and trees, he always characterized perfectly."

Of Li Ssŭ-hsün's son, Chu Ching-hsüan remarks that "Chao-tao did not equal his father in intelligence and strength of brush, though his depictions of landscapes and of birds and beasts were very detailed and clever." Chang Yen-yüan, however, takes a different view of Li Chao-tao: "He changed his father's style... and even surpassed him in excellence," and notes that he was "the first to do really good seascapes." The early Sung art historian Kuo Jo-hsü, in his *T'u-hua chien-wên chih* ("Record of Things Seen and Heard Regarding Painting"; ca. 1075), says that both father and son were excellent painters, though elsewhere in the book he gives the opinion that had they been active in his own time no one would have paid any attention to them — so much had the art of landscape painting advanced since their day.

The first precise indication of Li Ssŭ-hsün's style is given by Kuo Jo-hsü, who, in discussing the 10th-century painter Tung Yüan, says that he "had a colored style like that of Li Ssŭ-Hsün." A similar note is struck by an entry under Ssŭ-hsün's name in the catalogue of the collection of the Sung emperor Hui-tsung (1101–25), *Hsüan-ho hua-p'u*, compiled in 1302 from authentic records of his reign. "People today," it runs, "who paint mountains in the colored style all follow him, but they cannot equal his marvelous achievements." This is amplified by the *T'u-hui pao-chien* (Precious Mirror of Pictures), a collection of biographies of painters with a preface dated 1365: "He used gold and blue-green (*chin-pi*) in brilliant effect to found a 'family method' (*chia-fa*)."

The painting *Gaily Colored Lotuses in the Imperial Garden* (formerly Manchu Household Coll.) was described by the 17th-century connoisseur Wang Chih-teng in words that convey an excellent idea of what late Ming critics considered to be the authentic manner of Li Ssŭ-hsün: "It contains lofty buildings, temples, houses, gate-screens, costumes, and boats with their oars, all painted with the utmost skill and refinement, including every detail down to the smallest grass-blade. The mountains stand clear and luminous in the light of the setting sun; the billowing waters of the lake reach far beyond the limits [of the view]. Red flowers, rushing streams, green trees, soaring clouds and meandering rivers..." (*Wu-chün tan-ch'ing-chin*).

It seems from the passages quoted above that Chinese art historians became increasingly precise about the Li style the further removed they were from him in time, but there seems no reason to doubt the tradition that he painted in a meticulous miniaturist's technique, making full decorative use of strong mineral colors, often aided by gold outlines. It is unlikely that he invented this style; the ancient metaphor for painting — *tan-ch'ing* (reds and blues) — indicates that a richly colored style must have been in existence long before his time, and, indeed, provincial echoes of it are to be found in landscape details of 6th-century wall paintings at Tun-huang (q.v.). But it is probable that Li Ssŭ-hsün — aristocrat, official, and painter of talent — did, in fact, raise this technique to a new level of prestige and magnificence. On the evidence available, it is not possible to assess the relative contributions to this tradition of Li Ssŭ-hsün and his son or to gauge the accuracy of Chang Yen-yüan's remark in the *Li-tai ming-hua chi* that Li Chao-tao "changed his father's style."

Although nothing survives of the work of either Li, the titles of some of their paintings are preserved in early texts. Among the works of Li Ssŭ-hsün in the collection of Hui-tsung listed in the *Hsüan-ho hua-p'u* are two versions of *The Four Graybeards in a Mountain Retreat* (four famous scholars of the Ch'in dynasty who refused to serve Shih Huang-ti and retired to the hills), *Idly Fishing among the Streams*, *A Multitude of Peaks and Dense Forests*, and *Ming-huang's Excursion in the Imperial Park*. Figure subjects in the imperial collection included one Buddhist deity, one Taoist fairy, and a picture of five palace girls. Later texts and catalogues attribute to him a larger number of landscapes and of palaces and pavilions in landscape settings.

Of the paintings associated with the name of Li Ssŭ-hsün and still, or until recently, in existence, none are works of the early T'ang period. One of the most archaic in style is the *Chiu-ch'êng pi-chu t'u* ("Chiu-ch'êng Summer Palace"), a round fan painting on silk (PL. 152). This depicts the Jên-shou-kung, the former Sui imperial palace, after its transformation into the summer residence of T'ai-tsung of the T'ang dynasty. The palace buildings in the foreground nestle against a group of mountains piling up to the left. The dominant colors are blue and green; the pillars and walls are picked out in vermilion, and the hills are outlined in gold. Although this sumptuous little picture may well derive from an early T'ang original by either Li Ssŭ-hsün or Li Chao-tao, the actual execution, notably in the treatment of the distant mountains, suggests a date not earlier than the Ming dynasty.

More paintings are attributed by early sources to Li Chao-tao than to his father. The *Li-tai ming-hua chi* notes that there was a landscape by Li Chao-tao on the wall of the Wan-an temple in Ch'ang-an. Pictures attributed to him in Hui-tsung's collection include two sunsets (*Lo-ch'ao t'u*), a seascape, and a spring landscape. The sunset theme appears only briefly in the history of Chinese painting. It was used at Tun-huang to illustrate the story of Queen Vaidehi, and examples can be found in versions of the Ingkayō scroll and on the plectrum guard of a *p'i-p'a* (guitar) in the Shōsōin in Nara (Japan), but it went out of fashion after the end of the T'ang dynasty. Hui-tsung's collection also contained a picture by Li Chao-tao entitled *Chê-kua t'u* ("Plucking Melons"), a euphemism for the flight of the emperor Ming-huang from the rebel An Lu-shan, who occupied the capital in 756; the picture derives its name from the fact that one version showed a court lady plucking melons, evidently intended to suggest that this was no more than a leisurely excursion. Several early texts also attribute to Li Chao-tao a version of the *Chiu-ch'êng Summer Palace* (PL. 153).

At least five surviving ancient paintings are more or less closely associated with the name of Li Chao-tao. In the National Palace Museum (Taichung, Formosa) is a large hanging scroll depicting the scenery of the Ch'ü River (*Ch'ü-chiang t'u*). It shows an elaborate complex of palace buildings set in a towering landscape of peaks and rivers. The atmosphere is festive, the style archaistic rather than archaic; it might be a product of the Southern Sung Academy. The richly detailed album leaf in the National Palace Museum, the "Loyang Mansion" (*Lo-yang lo t'u*), preserves his subject matter, but the style is also that of the 12th or 13th century. Closer to the style of his period is a long landscape in gold and blue-green (*Chin-pi shan-shui t'u*) in the Sasakawa Collection in Japan. Though weak in execution, this cold, brooding landscape may well derive from one of his paintings.

The National Palace Museum contains a large landscape with towering peaks, "Travelers in the Mountains in Spring" (*Ch'un-shan hsing-yu t'u*), that is traditionally attributed to Li Chao-tao. It depicts a group of elegantly dressed men and women on horseback winding down through a defile into a clearing in the woods at the base of a triple mass of cloud-ringed peaks. The verticals are deliberately exaggerated; the style, particularly in the painting of the rocks, is precise and

somewhat mannered — indeed, rather what might be expected of a court painter of the Sung dynasty attempting to imitate the Li style. This picture is closely related to another much smaller and finer version of the same subject in the National Central Museum (Taichung, Formosa) entitled "Ming-huang's Journey to Shu" (*Ming-huang hsing Shu t'u*). Here the composition is spread out laterally instead of being squeezed into a vertical panel; the figures of the emperor and his entourage, horses, trees, and verdure are painted with minute precision, yet in a freely flowing line; the towering and overhanging peaks glow with soft blues and greens against the white clouds. Although certain details of the landscape and the extraordinary freshness of the colors indicate that this is probably a copy of the Sung dynasty at the earliest, this magnificent picture, more than any other surviving early work, seems to preserve the courtly style of the landscape painting of the 8th century, of which Li Chao-tao was the chief exponent. However, although several pictures of this incident are attributed to him in early texts, it is doubtful whether Li Chao-tao himself ever painted this subject. By 756, when the disastrous flight took place, he would have been a very old man, if indeed he was still living, and it seems unlikely that court painters would have been called upon to record it, in so gay and sumptuous a manner, while the memory of it was still fresh. Some authorities even doubt that this picture depicts the emperor's flight at all, and have suggested that it simply celebrates an imperial picnic. But whatever its subject, and whoever its author, this picture is an important document in the evolution of the green-and-blue "palace style" associated with Li Ssŭ-hsün and Li Chao-tao.

Another and more ancient picture that must closely reflect their style is a short hand scroll, "Travelers in Springtime" (*Yu-ch'un t'u*; PL. 155). It bears an inscription by the emperor Hui-tsung attributing it to the Sui court painter Chan Tzŭ-ch'ien. Here an open landscape is depicted, with a broad river stretching back diagonally between simple humped hills, and with a boat, figures, and blossoming trees. The style is archaic, the composition echoing some of the earliest landscape designs at Tun-huang; the careful drawing and the disposition of the trees along the contour lines are characteristic of the *chung-ku* (middle antiquity) style. Certain sophisticated conventions used in drawing foliage, however, suggest that this may be a late T'ang copy. In spite of the august source of the attribution to Chan Tzŭ-ch'ien, this anonymous painting could well have originated in a work by one of the two Lis.

The importance of Li Ssŭ-hsün and Li Chao-tao in the history of Chinese landscape painting is, like that of Wu Tao-tzŭ, not to be measured in terms of surviving paintings. It is even doubtful that a single authentic specimen of their work survived after the end of the Northern Sung period. But from early accounts of their style and from later pictures that are believed to reflect this style, it can be deduced that they perfected the decorative and meticulous realism that became identified with the "palace style" and was later carried on by Chao Po-chü (early 12th cent.) and a host of chiefly anonymous court painters (PL. 151) up to modern times. The Ming critics Mo Shih-lung (active 1560–82) and Tung Ch'i-ch'ang (1555–1636; q.v.) called this tradition the northern school, in contradistinction to the southern school of monochrome landscape painting, which they held had been founded by the 8th-century poet-painter Wang Wei (q.v.). No such distinction is made in the early records, however, and it seems likely that the style of Wang Wei was not as radically different from that of Li Ssŭ-hsün and Li Chao-tao as Chinese critics since the late Ming period have claimed.

LITURGICAL AND RITUAL OBJECTS. The types of objects used in religious ceremonies and magico-religious rites are frequently equivalent to those in secular use (see ARMS AND ARMOR; COSTUME; EMBLEMS AND INSIGNIA; FURNITURE; HOUSEHOLD OBJECTS; MASKS; MUSICAL INSTRUMENTS; UTENSILS AND TOOLS; VEHICLES). However, liturgical and ritual objects may be given distinctive form or decoration suitable to their specialized functions (cf. DEVOTIONAL OBJECTS AND IMAGES; ESCHATOLOGY) and reflecting the art traditions inspired by specific religious beliefs (see BUDDHISM; CHRISTIANITY; CONFUCIANISM; HINDUISM; ISLAM; JAINISM; JEWISH ART; MAGIC; SHAMANISM; SHINTOISM; TAOISM; TOTEMISM; ZOROASTRIANISM). While the variety of such objects is enormous, they may logically be grouped into a single broad category because of the many cross-cultural similarities of type and use.

SUMMARY. Primitive ritual objects (col. 270): *Function; Form; Production and procedures.* Antiquity and Asia (col. 276): *General observations; The ancient Near East; The classic world; The Iranian world; India, southeast Asia, Nepal, and Tibet; China; Japan.* Christian liturgical objects (col. 289): *The altar and its furnishings: a. Altar; b. Altar frontal (or antependium); c. Altarpiece; d. Candlesticks; e. Cross; f. Altar cards; Other church furnishings. Ritual objects: a. Chalice; b. Paten; c. Pyx; d. Monstrance (ostensorium); e. Ampulla; f. Aquamanile and basin; g. Liturgical spoon; h. Offering basin; i. Reliquary; j. Bell; k. Censer (thurible); l. Incense boat; m. Aspergillum and aspersorium; n. Oil lamp and spirit lamp; o. Flabellum; p. Lectern; q. Faldistory. Vestments and sacerdotal insignia: a. Alb; b. Surplice; c. Rochet; d. Dalmatic; e. Tunicle; f. Girdle; g. Amice; h. Chasuble; i. Cope; j. Maniple; k. Stole; l. Pallium; m. Succinctorium; n. Fanon; o. Rational; p. Miter; q. Tiara; r. Crozier.* Jewish ceremonial art (col. 309): *The Torah scroll and its appurtenances; Lamps; Other Sabbath and festival ritual objects.*

PRIMITIVE RITUAL OBJECTS. The controversial term "primitive" is applied here to the cultures that (unlike literate and more advanced societies) are chiefly dependent on nature — the hunting and gathering peoples, fishermen, and agricultural and pastoral tribes. This discussion of their ritual and sacred objects will exclude the fixed appurtenances and decorative elements of the sacred or cultural premises and treat only those objects utilized during religious ceremonies. These ceremonies assume a variety of forms, including sacrifice and prayer, ritual dances, and processions, as well as numerous observances which, though preponderantly social in character, follow inherently ritual forms and are at times related to the cult of a supreme being — for example, many marriage and funerary rites, initiation rites, and shamanistic practices.

Cult ceremonies consist of various organically related rites that succeed one another in a given order: preliminary and immediate preparations, the central ceremonial action, the participation of the people, and the conclusion. In this procedure

there are introduced accessories and equipment which, though they may be ordinary in themselves, take on the sacred character of the ritual. For example, a priest who purifies himself before offering the sacrifice requires a ewer and basin for water, and these objects become ritual equipment because of their association with the sacrifice. In the same way almost any object may become associated with ritual — from an undressed stone to a sculptured figure, from a rattan cord to a woven ceremonial robe, from a simple noisemaker to a stringed instrument, from a feather in the hair to an elaborate mask costume. The distinguishing factor is that objects are classified as ritual only when they are intrinsic and not merely incidental to ritual use.

The place of ritual objects in primitive art as a whole may be arrived at as follows: Within the broad division of sacred (as distinguished from secular) art, the products are either magic or religious. The former are discussed elsewhere (see MAGIC), though it may be pointed out that magic objects on occasion assume the function of cult objects; for example, the sword with which a medicine man vanquishes a disease demon to heal his patient may also be used as a ritual weapon in a ceremony to ward off malign spirits. Religious art, which is the dominating element in primitive art, may take a variety of forms, even occurring as a survival in secular art. Within this field, ritual objects, which are under discussion here, may be classified as "utilitarian," in that they serve specific functions during the cult ritual. The more stationary religious art forms and appurtenances do not fall into the same category, even when they are at hand during the celebration of the rites.

From the definition of ritual objects and equipment as religious utilitarian art two observations follow: First, with their obviously functional nature and religious purpose, these objects constitute the core of primitive art; they are therefore highly indicative of the character peculiar to the art as a whole, for the manifestation of religious art is most intense in the service of the ritual. Second, the interpretation of this ritual art must begin with its function, since the aim of primitive artists is not artistic beauty but suitability to the purpose. This approach is essential to conceptual interpretation, and it applies also to form and design, though the latter may be affected by factors unrelated to function.

Neither in ethnology nor in art history, fields that intersect in the study of primitive art, has there been undertaken a thorough thematic research on sacred objects and cult equipment; such a survey would provide the best means for distinguishing the religious and secular significance of these works of art. There are, of course, a number of studies of individual objects, including the sacred, but with few exceptions they deal primarily with technique or with the form and esthetic aspects of the objects.

Function. Every communal ritual has a twofold aspect: First it is an emotional expression of the community, involving an act of worship of the transcendental powers. Second, it brings the transcendental into the human world of the senses. The ritual centers around the act of worship and the scene of revelation, and is at once a serious act and a sacred game. It may cover the entire gamut of psychic, social, religious, and magical life, embracing mythology and cosmic imagery, but not necessarily in all forms of worship. For example, in ritual drama or dance a representational character predominates, whereas in sacrifice or prayer the cult action itself predominates. The twofold aspect of the common ritual, with the related cult practices, is reflected in the cult objects and furnishings, which may be classified in terms of the functions they serve.

The objects required to fulfill a physical action serve an *instrumental* function; the form they take depends on the immediate purpose. For example, the knife (PL. 157) is used to kill the sacrificial victim, the basin to wash the hands, the sacrificial cup to contain the substance intended for libation.

A *psychological* function is served by objects that arouse an emotional response. The drum may be used to heighten receptiveness to a state of ecstasy; incense predisposes toward trance; music creates an atmosphere of solemnity; monstrous masks inspire fear and hatred of the demons (PLS. 354–359).

The function of cult objects having emblematic significance may be viewed as essentially *social.* The ceremonial costume of the priest sets him apart as the representative of the people; emblems and standards are associated with specific groups or clans; the cult ancestor image intensifies the sense of collectivity; masks disguise the secret cult societies.

When a *magic* function appears within the ritual, implements are used to produce specific effects: sacral weapons banish demons; vessels dispense fecundity; amulets heal the sick who touch them. The magic power may be inherent in the object itself, or it may derive from a particular magic practice employed; in some cases the painted decoration, the form or material of the object, or the blood with which it is sprinkled constitutes the magic element.

The *animistic* function of certain cult objects and accessories is to provide the abode of ghosts or ancestor spirits, who may be consulted for advice, as oracles, judge the acceptability of the sacrifice, or otherwise participate in the rites. Sometimes the spirits manifest themselves by vibrating, making noises, pounding, or the like.

Cult objects also have a *representational* function, which involves both the subject and the manner in which it is realized. Whether artistically fashioned or not, these objects may represent a great variety of things: deities, spirits, demons, ancestors, myths, rites, acts of worship, magical spells, the great beyond, the upper or the lower world, the earth, the men wandering in the beyond. The manner of representation may be purely and intentionally symbolic. For example, a crude post or a magic wand may be identified with the phallus, or a stool with a tiger spirit; or the symbolism may be expressed in motifs such as a zigzag line for thunder, a wavy line for water, an eye for the all-seeing ancestors, a knob for a skull. On the other hand, the subject of the representation may be treated realistically: the serpent of the underworld may be carved on the backrest of a chair, the totemic animal painted on a drum, mythological scenes depicted on ceremonial vestments, or the tree of life represented on ritual fabrics.

The reference to reality is particularly important, because in the primitive concept the beings to whom ritual acts are addressed are not imaginary. This reference may be made in three ways: First, a meaning or fact may simply be conveyed. For example, the design on a shaman's drum may indicate that the shaman, during the trance, ascends to the heavens, without any implication that heaven is immanent in the drum. Second, the "presence" may be made actual in the object or may be represented: the head of a spirit carved on an object attests the spirit's presence therein; the animal painted on a ceremonial staff indicates that the club possesses the animal's strength. The spirit to whom a sacrifice is offered is regarded as being present. Third, according to the primitive concept that things can render actual what they represent, certain objects, usually connected with specific rites, may materialize supernatural beings and events. The shaman's costume (XIII, PLS. 1–3) not only has the effect of rendering him similar to the guardian spirit, but also, by virtue of initiation, can materialize the presence of the spirit and transform the shaman into it. Among the Australians of Arnhemland an entire mythical event is made real by the beating of a drum in which a snake is enclosed. Drum and serpent represent the primordial pair of ancestors, and the beating represents their sexual union. Either the form of objects or their ornamentation can activate the magic force of the things represented. As the bearers or representatives of transcendental powers or beings, cult objects and sacred furnishings often come to be worshiped. The ritual staff, in which a divinity is actually present, transcends itself, becomes identified with the divinity, and is worshiped as such. In some cases, therefore, the cult objects may be considered rudimentary forms of figural "idols," lacking only the development of form.

Frequently objects perform more than one function in a rite, one of which is the principal function, the others being secondary. The primary function may vary according to whether the object is used in a dance, in a procession, for sacrifice, or in some other connection. Objects such as axes or spears sometimes lose their functional nature and become decorative

axes or display spears, unsuited by their dimensions or decoration for practical use. The multiple functionality of the objects is a reflection of the beliefs of primitive people, who, in their religion make no rational differentiations but express the whole being of man and his world.

Musical instruments (X, PLS. 224, 225) are as ancient as worship and are rarely absent from it. They serve to mark the rhythm, create moods or excitement, express the feelings of the participants in the rites. Through sound, moreover, they effect contact with the other world. They may have cosmic significance (for example, a gong filled with rice represents the cosmic mountain) or they may symbolize spirits. The harp of the Bambara, with its square shape, symbolizes the mask of Kumabana: the two lateral pieces represent the eyes; the sounding box, the nose; the terminal portion, the mouth and teeth; the eight strings, the words. The high notes symbolize heaven; the low ones, the earth. Particularly rich in significance is the sacred drum. Among the Lovedu (Transvaal) the drum cult is one of the means of controlling nature for beneficent ends; the drum is in mystic relationship with the life of the queen and the people. Among the Woodlands Indians of the United States, the drum of the dream dance represents the Great Spirit. Among the Australians of Arnhemland the drum represents the uterus of the progenitress; in Africa, the mouth of man which opens and sings; among the shamans of Siberia, the world tree (birch) from which it is made. The drum summons or dispels spirits; it is the vehicle by which the shaman flies in the sky. Among the musical instruments, a distinction must be made for the so-called "voice masks" (PL. 156), which perform acoustically the same functions as the facial masks: they disguise the voices of the cult members, representing the utterance of transcendental beings. The bull-roarer (PL. 156) represents the supreme being's voice, but it is also used to ensure fertility, to protect, and to invoke misfortune.

Weapons, basically intended for defense, attack, and killing, are also introduced into ritual. The spear is used to transfix the sacrificial victim, and thus the weapon partakes of the blood's magic. A spear may also symbolize the cosmic tree; it may represent a phallus, or virile strength, or the might of the ruler or god; it may be the emblem of a deity, the abiding place of spirits, or the ancestral spear of the tribe.

The ritual ax in Africa illustrates the variety of functions an object may serve: Of divine origin (fallen from the sky), it is the insignia of the tutelary divinities of the ancestor; as the symbol of lightning, it heals the sick, promotes fertility, punishes injustice; as symbol of the thunder-god, brought to earth by the rainbow serpent, it is itself a thunderbolt; it is the instrument of the peace ceremonies, for it can overcome the strongest resistance; when represented on medicines (curing objects), it effects healing; it serves to sever the umbilical cord; it indicates a state of possession in dancers; and it is a symbol of virile force, the insignia of royal dignity, the accessory of messengers, an attribute of the priest, and so forth. Similarly rich in significance are the bow and arrow used in a ritual athletic contest in Tahiti.

Ceremonial costume serves as the adornment and insignia of rank; often prescribed by the gods and derived from the garb of divinities, it identifies man with god. Even sacrificial animals may be clothed, and costume itself may be a sacrificial offering. Often the costume is nothing more than a symbolic item such as a belt, which embodies the symbolism of binding and loosening, or a woolen cord representing the original woolen garment or the sacrificial animal. The costume of the shamans is a cosmic symbol, a microcosm, or a means of identification with the tutelary spirit, such as a skeleton or an animal.

Banners may represent tribes or serve as emblems of divinity or as the divinity itself. Together with its staff a banner may represent (as among the Dyak) the entire cosmos, since the staff is the tree of life. Banners and various items of apparel or cloth possess magic power, heal the sick, and dispel demons.

Vessels serve primarily to contain lustral water, sacrificial blood, or liquids for libation. Being of earth, however, they also represent the earth and are connected with the fertility complex; they may be symbols of the underworld, of the primordial waters, the water of life (Dyak); filled with rice, they represent the cosmic mountain of precious stone and are the home of spirits. Pottery vessels as soul dwellings are documented in Africa. Pots are also linked to the skull cult, in which head, vessel, and coconut shell are interchangeable elements.

Masks (q.v.) have an extremely important function, and not only as a primary part of the costume; in addition they invoke the presence of transcendental beings, are symbols of divinity, and have magical efficacy in warding off demons, in the prevention and cure of diseases, and so on.

These few examples indicate that an analysis of cult objects is necessarily concerned with their functions, which in practice are continually repeated.

Form. Restrictive factors over which the individual artist has no control are stronger in the ritual art of the primitives than in that of more advanced civilizations. Apart from the criterion of practical usefulness, effective factors are the magico-religious functions and their involvement with tradition, society, and the economy. These operate to determine the style, which accordingly varies from realism to abstraction. Four variations of form may be distinguished: (1) unworked objects left in their natural state, in which the original form is particularly significant (e.g., bones, roots, and stones); (2) objects fashioned in a purely instrumental form, with or without artistic effect, including those examples which have added decoration or organic modeling (e.g., unadorned sacrificial knives as well as painted drums, decorated fabrics, knife handles in the form of lizards, serpent-shaped ceremonial chairs); (3) artistically evolved objects (masks, ceremonial staves, banners); (4) objects combining evolved elements with parts retained in their natural state (e.g., a mask with human hair, a pole terminating in a skull).

The material frequently dominates the form because of its magic power (portions of the human or animal body, bones, skin, and hair have particular efficacy); because of its symbolism (e.g., the hardness of stone); because of its mythical requirements (for instance, the shamanistic drum in Siberia must be of birch, since this tree represents the world tree, and the drumhead must be of deerskin); or because in a given myth the archetype of the object is carved from a specific material, and the tradition cannot be disregarded. Particular apotropaic power is attributed to metals.

The art-critical claims as to the unity and purity of materials in primitive ritual objects are illusory. The materials cannot be tampered with because the determining factor in the art is not esthetic form but rather the practical, magical, and religious purpose. For example, shells set into carved eyes have a definite significance. From the link of purpose and material there also follows automatically a fixed stylistic tradition for particular objects; variations that might result from the use of new materials do not occur.

The technique of shaping varies with the individual arts: woodworking, sculpture in stone, metalworking, weaving, basketry, painting. Evidences of inadequacy in mastery of the technique may be due partly to the primitive nature of the artisan's tools and partly to religious traditionalism, in that ancient techniques continue to be respected even after new methods have come into use in the secular field.

It would be idle to expect a broad repertory of expressive forms such as are found among more technically advanced peoples. The primitive artist adheres more closely to the natural form and surface quality of his material. Thus he limits himself to fundamentals and tends toward abstraction.

The economy naturally influences the selection of materials (e.g., the preference shown for bone and hide among hunting or pastoral peoples), and it may also exert a direct influence on style. The hunters, continually dependent on a close observation of nature, are more inclined toward realistic representation. The sedentary cultivators find inspiration more in ideas and the imagination; their art tends to be ideological and inclined toward abstract forms. In these cultures the function of ritual objects is emphasized by the prominence given to certain parts of the body, for instance, a hand placed on a drum.

The instrumental function gives the object its fundamental form, to which all subsequent elaboration is linked. Dependent on this function are many stylistic peculiarities such as deformation, shortening, adjustment of lines, which adapt the various figures to the form of the object. The primitive artist, who has little or no mastery of the techniques of gluing and fastening, is likely to follow natural forms, as for example, in carving a stool in the natural shape of a branch. Two-dimensional decorations are more easily adapted to the functional shape of the object, but even here a special color symbolism may interfere with purely esthetic composition.

The other functions, especially representation, allow greater freedom, and the cult form may become elaborated. A mask that is used in an initiation will have different features from those on one representing a disease demon. An ancestor figure used in ancestor worship requires a careful and detailed human likeness, whereas a more summary execution and an emphasis on certain features would suffice for its magical function.

In all the aspects of form mentioned the influence of tradition is constantly present. There is also a direct traditional influence on creation, restricting the art product to the ideas of form that prevail in the community. An arbitrary deviation from such ideas is virtually unthinkable; such a rupture with tradition would be considered a profanation, since the forms linked to the cult partake of the absolute nature of the religion. Ritual objects are also intended, from the psychological viewpoint, to produce a specific effect on the spectators; this is achieved only if these objects conform to the generally accepted forms and ideas capable of producing such an effect. Accordingly, a mask should not be altered, since it would otherwise no longer be accepted as genuine. Thus a definite conservatism is evident in religious art objects. Even when modern implements have long been used in secular life, circumcision must be performed with the primordial stone knife, and the sacred fire kindled by striking flints or rubbing pieces of wood together; in the same way, the forms of ritual objects remain unchanged. The study of ritual objects may therefore be of great value in seeking the earliest forms of religion and art.

While ethnological studies have modified several nonhistorical theories on primitive art and have revealed a number of outside influences (such as those originating in the more advanced civilizations in Africa), these migratory influences are felt most strongly where art has lost its religious character. Stylistic changes in the ritual art of primitive peoples do not come from outside; on the contrary, religious art determines the other spheres of art. A change in style occurs usually through the transmission of a living concept, with the development of new forms of religion, whether indigenous or foreign. This distinction is to be observed also in the delimitation of styles and style regions. Ritual art does not readily become a part of a secular stylistic category, although the degree of secularization must be taken into account. Frequently two different styles can be distinguished in the same type of object: one secular and more advanced, the other sacred and conservative. The repertory of forms drawn from the religious background of a people readily leads to fixed types, standardization, and a formal impoverishment in their ritual art, so that the full potential of artistic development cannot be realized.

Production and procedures. Ritual objects are characteristically the work of trained men. Among most peoples women are barred from the production of ritual objects, except for pottery. Only rarely do the artisans work as independent individuals. For the most part, they belong to a group or are priests, magicians, or medicine men. In many places the cult officiant, the shaman for example, must himself make his instruments, his drum, and his iron insignia; in other words, he must know the trade of a blacksmith. The smith holds a special position in the creation of ritual objects. The artists are sometimes of aristocratic origin or have special ties with the chief's family (Congo, Polynesia). The ritual objects are not always produced in the place where they are to be used; certain pastoral groups in East Africa and the Todas of India do not make weapons, even though weapons are employed in their rites.

Since the artist has little freedom of creation and must heed tradition, the son or pupil learns from his father or teacher not only the technique but also the form; this, and not reality, is his model and will remain fixed in his memory. Thus there are established certain family or group schools, in which there is usually no division of labor. A single individual chooses and prepares the material and works on the object through the final stages.

The work is usually in itself an act of devotion. The artist must respect prescribed tenets, sacrifice, pray, purify himself, abstain from certain things, to ensure that the result will be successful. Usually he must even choose a propitious time: for instance, the heads intended for the skull cult must be boiled down and placed inside the sacred containers only during certain phases of the moon. The artist must purify his tools (possibly by fumigation) in accordance with all the magic relating to implements. During the work he often withdraws into a secluded place that is taboo to lay persons; the craftsman himself may likewise be taboo during that period, and it may be dangerous to touch his hands, because they are animated by divine force. At times, after his work, the artist is considered a sort of priest.

Also closely associated with the sacredness of the fabrication is secrecy. Among primitive peoples, the group of craftsmen often has almost the character of a secret society, with its own education, training, and initiation; and this is particularly true of ritual craftsmen. Often the instruction regarding the nature, manufacture, and use of the sacred objects constitutes one of the chief tasks in the secret initiation of the boys. The manufacture may also be linked to the secret traditions of certain tribes or families; in Togoland, for instance, the casting of bronze was usually secret and practiced by members of the Amonikoyi family, natives of Ilorin.

The sacred nature of the objects requires their separation from the secular world by means of a consecration, usually in connection with a sacrifice. The objects are given a ritual bath or are fumigated, smeared with blood or anointed, decked with symbolic ribbons, painted, or decorated with magic appendages. When the object is to have an animistic function, it is animated or opened up to the spirits or ancestral ghosts by being colored red or painted with an eye motif, a circle, or other symbol.

Ritual objects are taboo and therefore are kept in special places, in temples, spirit houses, or priests' homes. They are often forbidden to the sight of women and may not be touched by laymen; frequently they are kept secret and hidden.

Because of their sacredness, their magic power, or their function as the abode of spirits, ritual objects, even when not in cult use, can be worshiped individually, as independent "idols." For example, a priestly garment, a banner, or a ceremonial spear may become the center of a secondary cult, with religious rites or magic powers in divination, evocation of spirits, curing, and so forth. After their consecration ritual objects must be cared for, strengthened, nourished with sacrifices, and reanointed, so that their power does not weaken. Unusable objects that have lost their efficacy or strength usually cannot be converted to secular purposes; they are abandoned to slow decay, taken to some secret place, burned, or buried out of respect for their sanctity.

Dominik Schröder

Antiquity and Asia. *General observations.* The statements in the preceding section basically apply also to ritual objects of the ancient world. Certain fundamental attitudes in religious beliefs and worship, and all the practical consequences of these attitudes, remain unchanged throughout the ages regardless of differences in locale and the evolution of cultures. It may be objected that the combined evidence of primitive cultures and of the oldest historical documents is insufficient to shed light on the genuinely initial phases of religious activity and especially to explain the evolution from these phases to the forms in use among advanced civilizations (a problem that constantly recurs in any study of the genesis of particular aspects of culture and art). From the mute, extremely fragmentary archaeological documentation it seems virtually impossible to determine the

facts about prehistoric cults and about the meaning of objects pertaining to them.

Richly decorated *bâtons de commandement*, so-called, from the Magdalenian period (XI, PL. 247), pebbles painted with geometric patterns dating from the Mesolithic era (from Le Mas d'Azil, in France), and many other artifacts of uncertain purpose may be attributed in theory to some unknown ritual requirement, and any attempt at figural representation among prehistoric peoples may fall within the province of religion or magic (see PREHISTORY). Nevertheless, such products cannot be designated, even tentatively, as ritual objects in the sense applicable to certain classes of products from the great religions of antiquity.

The essential factor in the artistic development of any group of sacred objects from the more advanced civilizations is the degree or manner of differentiation in appearance from the objects or furnishings in everyday use, such as containers, knives, tables, and articles of clothing or personal adornment. The distinction may exist in the richness of the material, in the shape of the object or its embellishments, or in the addition of allusive or symbolic details suited to some specialized use; conversely, it may be manifested in the ritual preservation of primitive forms at variance with the material progress of the culture. For example, the stone sacrificial knife was retained in certain sacrificial rites in the classic world, and the form of the tabernacle on the Christian altar perpetuates that of the nomadic tent. There are also, occasionally, completely new types and forms relating to particular ritual requirements.

These processes are obviously directed toward meeting the fundamental requisites of the cult in various forms of religious activity. For sacrificial and purificatory rites there were developed special tables, altars, portable trays, hearths, braziers, tripods, and censers, in addition to vases for offerings, axes, and knives. To accompany the ceremonies there were musical instruments and noisemakers, as well as lamps, torches, and candelabra. To set apart and adorn the celebrants and their attendants, the victims, and the ceremonial sites, there were ornaments, fillets, crowns of flowers, and the like. Certain objects associated with special rites, notably those of the mystery religions, are difficult to interpret.

Unfortunately, archaeological documentation of these categories of objects is extremely scant and incomplete or, in many cases, simply nonexistent, because temple furnishings, with their sacred character or actual value, were more likely to vanish in the course of time than material sealed in tombs. The lack can be supplied to some extent by figural representations of ritualistic scenes and by written sources.

Historically there is a certain unity of traditions and continuity of types in the development of the great polytheistic civilizations of antiquity, from the earliest settlements of agricultural and proto-urban centers in the Near East, in the Mediterranean, and in southern Europe through the entire classic age.

* *

The ancient Near East. The development and use of morphologically differentiated ritual instruments and sacred equipment should certainly be considered as having occurred even before the appearance of written documents (3000–2800 B.C.). This assumption is supported both by finds such as the female votive or cult statuettes in terra cotta in western Asia and the rich deposits of pre- and protodynastic offerings at Hierakonpolis in Egypt (IV, PLS. 322, 324, 325) and by the Mesopotamian religious rituals and the evidence of the pyramids, the conservative nature of which makes it almost certain that a whole set of ritual objects had developed concomitantly with the appearance of the highly developed polytheism characteristic of the peoples of the ancient Near East in the preliterate period.

The obvious difference in character between ritual and nonsacred objects from earliest times is evident, for example, in Mesopotamia, where the presence of a cult altar is sufficient to identify a building (temple of Eridu). Likewise, certain rooms in the autonomous palace complexes of later periods may be identified as chapels by the presence of offertory tables; such is the case with the palace of Mari, in which two rooms were set aside for specific religious functions.

It is essential to make a distinction between the ritual objects of peoples of high sedentary cultures and those of the nomadic and seminomadic peoples from the mountains or desert. The less complex and differentiated cult activities of the nomads did not produce any extensive development of ritual objects and even less of sacred furnishings. The lack of documentation here is only partially offset by the descriptions of certain archaic sacrifices in a few Biblical passages and in the Ugaritic poem of Kerat (I, 62–79), which make it possible to attribute these rites to seminomadic peoples; however, the liturgical objects mentioned (chiefly gold and silver vessels) are not necessarily as ancient as the sacrifices described.

While it is not usually difficult to identify ritual material as such, it is frequently the case, especially in Mesopotamia, that the names of many sacred emblems (e.g., Sumerian *šar-úr*, *šar-gaz*, *an-kár*, *eme-gir*, *mi-ib*, *a-ma-ru*, *ḫa-ra-ib*) and ritual objects (e.g., Sumerian *alal*, *alal-liš*, *pisàn*, *mal*, *zi-da-kù*, *bur-kù*) are known from the abundance of ritual texts, but the morphological nature of these remains unknown because of the comparative scarcity of depictions of ritual scenes; only occasionally do the cuneiform ideograms permit the precise identification of objects. The problem is more easily resolved in respect to Egyptian objects because of the existence of large temple reliefs that give a clear idea of the furnishings of several New Kingdom temples; particularly notable are the accurate representations of the solemnities in honor of the god Min of Coptos. Syria, too, has yielded a considerable number of ritual objects, which can be interpreted only by reference to Biblical texts because, apart from the remarkable list of votive objects from the temple of Ningal in ancient Qatna, there is a dearth of other useful sources. Very few ritual objects have been found in Anatolia and southern Arabia (almost all the examples from these regions being irrelevant), though a study of Hittite rituals might suggest that there had been an extensive development of objects of this sort.

Ritual objects of the ancient Near East have remained morphologically unchanged to an exceptional extent, apparently because of their functions; but despite this immutability, sacred objects can be distinguished from others by the precious materials used for ritual articles and by their fine workmanship (in some cases that of very skilled craftsmen in precious metals). This does not apply to such very common objects as vases, although there are exceptions (e.g., the ritual vase of Uruk; IX, PL. 466).

Certain special materials were customarily used in the different cultural regions of the ancient Near East for objects that were most important in function and size. In Egypt, for example, altars and offertory tables were usually made of stone (or secondarily, but rarely, of brick), while in Mesopotamia altars for burning sacrifices, podia for offerings, and basins for libations were generally built of brick, or occasionally of plaster, even in places close to stone quarries, such as Mari.

Not infrequently certain types of both ritual objects and furnishings came into use beyond the geographic boundaries of the specific cultures, Egyptian and Mesopotamian cultures generally constituting the preponderant influence in such dissemination.

Sabatino MOSCATI

The most important element in ritual furniture of the ancient Near East is the altar. In its simplest form, common to all cultures of that region, the altar appears as a rather small table (usually circular, but occasionally in one of various geometrical shapes) sustained by a support in any one of several different forms. In Egypt this type of altar is documented as far back as the earliest dynasties, and it persisted up to the Ptolemaic period. The support is very high in proportion to the breadth of the table itself, cylindrical in shape and tapering slightly toward the base. Basically similar in form is a table depicted on a relief from Ugarit, in Syria, which differs only in that the lower portions of the support form a tripod, a variant

characteristic of the wooden Egyptian prototypes from the archaic period. In the rest of the Asiatic regions, including southern Arabia (where, as in Egypt and Syria, the altar was a table for offerings to the dead), the type of table used for offerings during divine office or in funerary services was indistinguishable from an ordinary table: a table with legs crossed in an X form or forming a tripod or tetrapod (the last type is depicted on the Phoenician sarcophagus of Aḥīrām). The four-legged table was also used in Egypt. Related to this type are Assyrian altars from Khorsabad — one dating from the reign of Ashurnasirpal II (London, Br. Mus.) and two others from the period of Sargon II (Paris, Louvre; and Istanbul, Archaeol. Mus.) — in which the features described above are combined with those of another type: a large circular table of stone, resting on a stone prism with a triangular base, its corners resembling the legs of a bronze support. However, the latter type of altar generally does not occur in the earliest Mesopotamian periods.

A second type of altar, in widespread use throughout Mesopotamia and in adjacent regions, consists of a rather low block of massive stone; in representations it appears cube-shaped or in the form of a parallelepiped, either smooth or, more frequently, fluted toward the top; or it may be cylindrical, widening toward the top or bottom or in both directions. From the 2d millennium B.C. this type of altar, in the shape of a prism, was quite commonly used, to hold various sacred objects, such as symbols of divinity, baetuli, or horned tiaras. There are two variants of this type from Assyria: one has two kinds of protuberances along the upper edges, as seen on two altars of the late 2d millennium; the other, which subsequently came into widespread use in Iran, Anatolia, and Phoenicia, has a series of stepped pinnacles along the upper edges and at the four corners. The small horned altars found in several sites in Palestine may be a variant of this type. Small cubical altars on four pedestals or on truncated pyramids have been found in southern Arabia.

There are other more complex variants that cannot be traced back to a common prototype, even a theoretical one. For instance, stepped altars were in common use in Mesopotamia throughout the Akkadian period and until the beginning of the 2d millennium B.C.; these consisted of two steps, on the first of which a container of flowers or plants was sometimes placed (the prototype of the Syrian "gardens of Adonis"). One terra-cotta example from Ashur looks exactly like those depicted on monuments. In Syria, Palestine, and southern Arabia, stele-altars have been found that seem to carry out the same theme of two steps: a staircase, on which offerings were perhaps placed, projects from under the stele, which bears liturgical symbols. Characteristic of Anatolia is a monumental altar, known from reliefs on two statue bases from Bogazköy and later found in excavations at Beycesultan. The altar consists of a massive cube on which there stood two long poles that curved forward. A relief from Alaca Hüyük shows a king sacrificing before such an altar, which is high and T-shaped, with the lower portion widening toward the base. Highly unusual in its bold and complex structure is the unique Egyptian solar altar that stood in the courtyard of the temple of King Neuserra (5th dynasty). Of monumental size, it consists of a central circular slab of alabaster, flanked by four alabaster blocks with the hieroglyphic sign *ḥtp*.

Certain other ritual furnishings are related to the offertory tables. Most commonly used throughout Mesopotamia in the 2d and 1st millenniums B.C. were tall, slender cylindrical stands widening toward the base. There were also more complex stands, among them two bronze specimens from Kish: one is shaped like a trident resting on the back of a frog; the other, much damaged, is in the form of a cylindrical basket into which a vase was inserted. Stands from the Syro-Palestinian region are more complex. The bronze tripod (PL. 158) found at Ugarit (similar to the altar base depicted on the sarcophagus of Aḥīrām) and the wheeled carts found in Palestine and Cyprus (IV, PL. 92), which correspond to the cart described in the Bible as built by Hiram for Solomon, are expertly wrought in bronze and represent a type that apparently did not exist in Mesopotamia of that period.

From several Palestinian sites come certain objects of undetermined significance, which appear to have had a ritual purpose because of the symbols of divinity (often serpents) with which they are decorated. They are made of terra cotta and are classified as censers or perfume burners because they have slits, although they bear no traces of fire.

Other objects of uncertain function are the small models of sanctuaries and sacred edifices. Some of them might have been connected with funerary rites (e.g., urns in the shape of a hut, from Ugarit), but this is not certain in every case. The articles were in widespread use throughout a region that includes the Syro-Palestine area (Jericho, Hadera, Mari, and Ugarit).

The ritual article that was most widely diffused was the libation vase. The earliest Mesopotamian specimens are either conical or cylindrical, with a foot; there is an example of the latter from Uruk preserved in the Iraq Museum of Baghdad (PL. 466). Of later date is a vase with a long slender spout, a type not confined to this region, however (PLS. 470, 475; IV, PL. 204). In Egypt, besides libation cups, which may have been related to the Palestinian footed chalice, there is documented a ritual sprinkling vessel that remained practically unchanged in form throughout the entire period of the Pharaonic civilization; a narrow, elongated bottle, slightly wider toward the top, occasionally with a large side spout, it was originally produced in terra cotta but was later made in nonprecious metals, such as copper or bronze, and, occasionally, in precious metals, such as gold or silver. Several representations from the New Kingdom show a sprinkling vase patterned on the hieroglyphic sign for "life," a theme that also occurred in Egyptian-inspired Syrian seals. In the Assyrian period in Mesopotamia and in the Saite period in Egypt it became a widespread practice to use bronze pails (situlae) for lustral water. Many of these Egyptian receptacles are decorated with figures of deities and with ritual scenes (PL. 158). In Assyrian reliefs the water seems to be extracted from the pails by means of a cone that served as an aspergillum (PL. 489). In Palestine specimens of multiple vases (kernoi) with circular bases have been found.

In Egypt and in the areas it influenced (Palestine, Syria, and Anatolia) offerings were purified with incense; the incense was put in terra-cotta bowls that were placed in the hand of a wooden model arm. The censer, subsequently made of metal, was still further refined in Egypt by the addition of a second small bowl in the middle of the arm for the pellets of incense. The name of the censer is the equivalent of "incense arm" and, later, "the arm of Horus," because the handle had the hawk-headed form of that god. There are a few bronze specimens of the later type preserved in excellent condition in the British Museum and in the Vatican Museums (PL. 158). In Palestine this type of censer also occurs in stone, and there are huge bronze ladles with handles in the form of female figures.

Although some articles — such as votive objects, foundation treasures, Mesopotamian stone vases, various receptacles, the bed on which the sacred nuptials took place, sacrificial implements, and the priestly insignia borne by the king or priests — played some role in liturgical practice, they will not be treated here, because too little is known for adequate discussion of the types, or they properly fall under other headings. However, several categories of cult instruments should be mentioned, among them the sacred musical instruments. Sacred ceremonies were always accompanied by music, at least in Mesopotamian and Anatolian cultures. In these areas there was but one sacred instrument, the kettledrum, the construction of which is minutely described by a liturgical text. A representation, unfortunately very schematic, can be seen on a fragment of a Sumerian vase in the Louvre: behind the figure of a man in priestly robes two women support a large drum, on which a small figure stands; around the cylinder of the drum there are some semicircles, perhaps jingles. In Egypt the sistrum was used in the worship of the goddess Hathor (PL. 158). The oldest known specimen is a model of a votive sistrum, made of alabaster and bearing the royal protocol of Teti (6th dynasty), now in the Metropolitan Museum of New York. Its finely executed handle is formed like a papyrus stalk, and the sound box is a small temple surmounted by a hawk. This type of sistrum, with

jingles suspended in rows, is documented as early as the Ptolemaic period, in stone, bone, or pottery votive models and in wall paintings in temples and tombs. The head of Hathor often appears on both sides of the tip of the handle. With the New Kingdom there came into widespread use another type, without a sound box and with the jingles inserted into an elliptical frame. Sound was produced by small jingling crossrods loosely set into the frame or by disks strung upon fixed crossrods. A great many votive specimens of this second type, dating from the Saite and Ptolemaic periods, still exist.

There were also objects that could be carried in processions. In Egypt there were many such objects, documented principally by temple reliefs (e.g., the relief in Luxor which illustrates the celebration of the feast of Opet), and there is ample testimony in the Harris I papyrus (Br. Mus.) from the reign of Ramses III (first half of 12th cent. B.C.), as well as indications in other texts and from excavations. Of great importance in Egyptian temples was the sacred bark for transporting the divine image during the yearly rites (IV, PLS. 368, 385). An especially magnificent example is the boat of Amen, called *wrs-ḥ;t*, which was made of cedar sheathed with gold, the shrine it bore being of solid gold and precious stones. During feasts small portable shrines, their sides often veiled with curtains, were also used. There is a specimen in Berlin (Staat. Mus.) of one in bronze and wood that had been consecrated by Amasis (mid-6th cent. B.C.). Also displayed in religious ceremonies were the divine insignia, which were carried on long poles topped by small platforms; the symbols called *wp-w;wt* frequently preceded the litter bearing the sacred image in processions.

Statues of Mesopotamian deities were carried on their bases, into which long wooden poles were inserted. The same system was employed for miniature temples, or portable shrines, as well as for the thrones of Anu and Enlil (which did not have cult statues). The structure of the Mesopotamian boats, which are often depicted on seals, is not clearly known; some texts imply that there was a river basin (*apsū*) in the vicinity of every temple, which might explain the representations of large boats that sometimes bear divine figures and an altar.

For the religious objects used by the Israelites, see below, *Jewish ceremonial art*.

Sergio BOSTICCO and Giovanni GARBINI

The classic world. In the religious sphere of Greece and Rome the primitive rites of offering, purification, and sacrifice gradually took on fixed forms, and the establishment of the state brought about a marked difference between private observances and public religious functions. For the latter there were developed increasingly imposing and even spectacular furnishings and implements, while private rites retained more traditional and simpler forms. In Roman houses, for example, the appurtenances for the simple ceremonies of libation, offering, and lustration were limited to the patera, salinum, acerra, and praefericulum. The altar was at first identical with the hearth, and one name (Lat., *focus*; Gr., *eschara*) applied to both; with the later development of the Roman house, this identity was lost, and an actual altar (ara) was placed before the image of the penates.

Public rites called for the use of a great number of accessories, but they may be reduced to a few types.

Of primary importance is the altar (Lat., *ara*; Gr., *bōmos*). Primitive altars were simple masses of shaped stone, and their ornamentation was of a temporary nature; subsequently, however, wreaths, festoons, and sacred fillets were carved directly on the flanks, enriching the altar with a decorative element that was at times remarkably artistic.

Aside from such monumental altars as that of Pergamon or the Roman Ara Pacis (the actual use of which is debatable), there are many examples of altars richly decorated according to the artistic tastes of the time. In spite of great variety in form and dimensions, the essential elements of the altar were substantially the same. However, the altar employed exclusively for blood sacrifices was a large structure, equipped with a step, with grooves and holes for drainage of the victim's blood, while the altar used for simple offerings was usually a smaller unit with more carefully executed decoration.

In Greece the altar, in keeping with the classic linear style of the temple, was of studied proportion and detail, the decoration usually being confined to skillfully designed cornices. In the Roman world, however, a range of types developed, including special funerary, votive, and commemorative aras, as well as certain others varying in significance according to where they were erected (e.g., at the boundaries of fields).

A purpose similar to that ot the ara was served by a portable brazier (also called *focus*), on which libations of wine or incense were poured, and by the tripod (Lat., *tripus*; Gr., *tripous*), which took two different forms. In the form of a brazier, a small receptacle on three legs, it substituted for the ara and was often delicately worked. This type may be seen in many historical reliefs (PL. 161). In the form of a table with a flat surface, the tripod held liturgical objects and offerings; an example of this type appears on a relief from Konjic, Yugoslavia, showing a tripod-table prepared for the mystic feast with four crossed loaves of bread and a cup.

The finest tables were placed in the cella of the deity, forming an integral part of temple furnishings; less elaborate in both execution and material were the tables on which instruments and offerings were laid out (*mensae anclabres* or *anclabria*).

The ara and some of its related forms also existed outside the sphere of direct Greco-Roman influence. A ceramic fragment from Numantia bears a religious scene in which the ara is a simple polyhedral mass decorated in a manner suggesting not so much actual sets of ornaments as the free fancy of the decorator. The altar used by the Sardinians seems to have been a simple stone block with a hollow in the center and a drainage channel, but the tripod ara (PL. 432) also appears to have been in use, as well as a cruder form of the offertory table, a roughly circular block with a hollow for the offering. Several pieces of precious metalwork from Crete show the altar in the schematic form of a parallelopiped surmounted by one or more pairs of sacred horns; later, tripod altars and offertory tables were also used in Crete. The great table of Mallia is the most famous example of a long series that excavations have brought to light nearly everywhere in Crete from Pyrgos to Platonos to Pseira. In these specimens it is apparent that an effort was made to achieve an artistic solution or, at least, to attain a certain rhythm in the regular placement of the hollows; and the remarkable variety of form makes it one of the most interesting categories of ritual furnishings. In Etruria there were both very large aras, such as those of Vignanello and Veii, for blood sacrifices, and other, smaller altars, of simple workmanship and adorned only with a molding on the upper portion.

There is a vast number of receptacles designed to contain the liquids for libations (see CERAMICS; HOUSEHOLD OBJECTS), some of these vessels being used only during one particular ceremony; for example, the plemochoe, a sort of covered chalice, was used on the final day of the Eleusinian mysteries, and the chous was used only on the second day of the Anthesteria. There are also special receptacles for decanting the liquid and others to hold the lustral water.

The most sacred receptacle was the phiale, documented in Greece as early as the end of the 6th century; it corresponds exactly to the Latin patera, being a broad cup, without foot or handles and with a raised boss at the center (PL. 161). Indispensable to every ceremony, it was the ritual vessel par excellence; it is often reproduced in bas-reliefs and coins to indicate some religious function or purpose. The decoration of paterae is rather restrained, usually being limited to gadrooning, although there are some with festoons of leaves and fruit, but the material was usually of special value. Another vessel having a like function was the *spondeion*.

Among the instruments used for pouring liquid into the patera was the simpulum (PL. 161), which was at first used for domestic purposes as well but later was replaced by the kyathos, a vessel similar in form but of greater capacity. Since this vessel is frequently mentioned in temple inventories, it is likely that there were finely wrought examples.

The *capedo*, a cup with handles, is an example of the persistence of obsolete objects in rituals, for the prototypes go back to prehistory, but the vessel very early went out of use for

everyday purposes. Two other receptacles of this type are the *spondochoe* and the praefericulum, the latter a small bowl — usually made of silver — that, like the patera, was usually very carefully wrought. Again, the decoration is not complex or highly varied, being usually limited to a gadroon on the body of the vessel, with the curve of the handle ornamented only slightly more elaborately, but the vessel had a marked dignity of form, especially during the Roman imperial period.

The liquid for the libation was first poured into a crater, a receptacle documented quite early as having a clearly defined purpose. Both its size and its use in particularly solemn ceremonies indicate that this vessel was one of the most important of the ritual implements. Sources often cite, among the outstanding objects in sanctuary treasuries, magnificent craters of precious materials in the Eastern tradition.

Another type of libation cup, the rhyton, merits special attention. A large number of these vessels have been discovered in Crete. They vary in form, but most typical is an elongated cone, generally of simple design but made of precious material. Some are exceptionally artistic and valuable as documents, among them a rhyton from Hagia Triada (IV, PL. 62).

Of the group of vessels for holding lustral water, undoubtedly the best known is the *lebē*, a basin that varied in capacity, often with the addition of either a conical or tripodal support. The finest examples are those from the Etruscan areas, in particular those from Vetulonia, made of sheet bronze with Orientalizing decoration. Although these vessels were not actually ritual objects, and though the situlae found in that area were made exclusively for tomb furnishings, the characteristics of vases used for ritual purposes can be determined from the form of these objects.

The origins of the situla date back to the Iron Age. Generally a vessel of truncated conical shape, the type was widespread throughout the entire Mediterranean basin, for domestic utilitarian purposes as well as for religious and funerary rites. The situla was carried to the site of the ceremony by means of a rod passed through the handles, as depicted on the sarcophagus of Hagia Triada (IV, PL. 62), the Certosa situla (V, PL. 34), and, later, the Corsini chair (Rome, Mus. Naz.). The examples shown in Cretan painting are polychrome, perhaps indicating damascening, a technique known to the Minoan-Cretan civilization. However, the decoration of Italian and Etruscan situlae was usually limited to repoussé. Little used in the Greek world, the situla was widely employed in Rome, particularly after the introduction of the worship of Isis.

Other containers for purificatory water include the kalpis (VII, PL. 194); the *futile*, a vessel with a pointed base, which was used in special ceremonies in the cult of Vesta; the *ardanion*; and the urceus. The *perirrhanterion* and the labrum were basins placed at the entrances of temples or sacred enclosures for the requisite purification, an ancient usage that still survives in the use of the holy-water font in churches. Lustral water was at first sprinkled by means of a bunch of leaves, but later the aspergillum (PL. 161) — the direct forerunner of the Christian aspergillum, or holy-water sprinkler — came into use for that purpose as an independent instrument with its own special form.

There are also many vases about which little or nothing is known, except that they were used during sacrifices.

Undoubtedly one of the most distinctive receptacles is the kernos, which was very likely a vase for offerings and seems to have been used only in certain mystery ceremonies. This name is generally applied only to a cup-shaped vase, to the sides of which other small receptacles were attached.

Besides the vessels proper there were baskets used to contain both the offerings to the deity and the ritual objects. One of these baskets is the *vannus*, broad and flat in shape, which originally functioned as a sieve to separate the wheat from the chaff. This object was especially important in initiation ceremonies, during which it was placed on the neophyte's head. A very similar receptacle is the *kanes*. The *cista* was a cylindrical basket with a lid used to hold the sacred symbols for the performance of mystery rites. It evolved from the simple container for offerings of classic times to become in a later period an indispensable element in the Greek mystery cults from the East.

A separate group of ritual objects are the sacrificial weapons. These objects may be reduced to two basic types: the ax and the knife.

Among the first group are the dolabra, an ax of rather general use, and the *securis*, the weapon usually represented in scenes of sacrifice, which corresponds completely to the modern ax. The double ax (sacena) of the high priests (PL. 161) seems to have had a more symbolic significance, serving almost as a badge of the highest priestly office, in addition to its sacrificial function.

Among the sacrificial knives are two weapons that were a cross between the sword and the knife, the *kopis* and the *machaira*, the former with a long, slightly curved blade, the other with a slightly wavy blade. In preference to these types, used predominantly by the Greeks, the Romans favored a shorter knife with an iron blade and an ivory handle ornamented with gold and silver. Even in the latter case the knife was not, strictly speaking, an object of artistic value, since the very use of precious material seems to have been considered an almost exceptional decorative element, a point stressed in the sources. Furthermore, the emphasis on function in instruments of this kind, against the background of the archaic and conservative character of the ritual, explains the simplicity and, at times, crudeness of such objects. A special type of knife is the *secespita*, which has a thickset and roughly trapezoidal blade.

Another sacrificial instrument is the *malleus*, a hammer that was sometimes used instead of an ax for slaughtering very large animals.

One of the purifying elements, in addition to water and fire, was incense, which was kept in the acerra (Gr., *libanoutris*), a small chest decorated more or less elaborately for an effect of richness.

Another accessory for incense was the *turibulum* (Gr., *thumiaterion*) or censer, which, in the classic period, was similar to a candelabrum with a simple shaft, surmounted by a small brazier. Depictions from various epochs and places, ranging from the Minoan-Mycenaean civilization to the Etruscan and Roman worlds indicate that it was extensively diffused. Occasionally the censer had the form of a small, low brazier with three or four feet — a type in which the craftsman was free to follow his imagination, producing extravagant creations that disguised the true nature of the object.

Thuribles used in ceremonies were more restrained and functional in design, as indicated by discoveries from excavations of cult sites and sanctuaries in Crete, which yielded thuribles in the form of braziers, as well as others, many of terra cotta, in the shape of a simple column.

The purificatory element of fire was always present; torches, or *faces*, were used in every place of worship and during every religious rite. Their function as illumination was not the major one, for torches were used even in daylight and in the open air and had sacred fillets twined around the shafts.

Accessories that were only occasionally used include the *tensa*, a small two-wheeled cart of costly material and rich decoration, which was used to carry the attributes of the divinity; and the pulvinar, a richly adorned bed on which the images of the gods were deposited to symbolize their direct participation in the ceremony. On the other hand, the armarium and the sacrarium were in constant use; these were small aediculae, with or without doors, in which were placed, respectively, images of the lares and the ritual instruments (V, PL. 429).

The Greek and Latin forms of worship differed considerably in that greater importance was attached to music in Greek ritual. In Rome the use of ancient religious chants was a sporadic phenomenon linked to popular spontaneous expression, while in Greece music was an essential part of the ceremony itself, perhaps as a result of Greece's propinquity to the Oriental world, in which the dance and music took on a very special character and were themselves tantamount to prayer. The aulos, either single or double, and the lyre were the most extensively used of Greek musical instruments. Musical accompaniment with flute and lyre also became customary in Etruscan regions, and the practice spread from there to Rome, where the influence of Hellenic civilization fostered its diffusion. A very common instrument

in the pre-Roman world was the tuba, a long, straight trumpet invented, according to tradition, in one of the Etruscan cities. There were also other musical instruments believed to possess prophylactic or apotropaic powers; examples include the sistrum, tintinnabulum, and tympanum (see MUSICAL INSTRUMENTS).

Among liturgical objects there may also be included the lituus, a curved, knot-free stick used by Etruscan priests for bounding the sacred space of the templum (the lituus, originally, was slightly curved at one end, but later it acquired a more complex form with a large three-turn volute); the *mantele*, a small towel borne by the camillus on the left shoulder or arm; and the sacred fillets (vittae, taeniae, infulae) with which sacrificial victims were adorned to indicate their inviolability, this being further defined by the *dorsuale* and *frontale* adorning large sacrificial animals in ceremonies of special solemnity. In addition, wreaths were used to embellish temples, altars, and sacred enclosures on ceremonial days.

Little is known about ritual objects used in the religious ceremonies of the peoples on the periphery of the classic world. The only object known to be peculiar to the Germano-Celtic peoples is the small golden sickle with which the Druids cut the sacred mistletoe on the sixth day of the moon. However, sacrifices were made, and it can be assumed that the weapons used in killing the victims were similar to those used by the Greeks and Romans. The only existing example of an altar is that in Gamla Uppsala, Sweden, under the present parish church on the site of an older temple.

Ritual objects from Iberian cultures are represented in votive statues from Cerro de los Santos and Despeñaperros (PLS. 408, 410) and in the reliefs of Osuna, as well as in a number of scenes painted on pottery from Liria, which show that a double-reed pipe, an ax, a knife, and receptacles for offerings were used.

Giovanna ALVISI

The Iranian world. Since the earliest phases of the Iranian religion, the instrument most frequently and widely used has been the sheaf of twigs referred to in the Avesta as the *baresman* and called *barsōm* in Pahlavi. Representations of it are known from as early as the Luristan phase (e.g., the silver plaque with an image of the god Zurvan; Cincinnati Art Mus.), although there are fewer examples from later periods. However, except as reflected in religious iconography, the *baresman* is intrinsically without artistic merit, as is its modern counterpart in steel wire used in the Parsi ritual. The twigs were bound with a noose (Avestan, *aiwyāŋana*; Pahlavi, *aiwyāhan*; now called *kustī*), but since this was a perishable element, no description can be offered. It is likewise difficult to determine the artistic and esthetic value of such cult instruments as the cup (Pahlavi, *tasht*) for liquid offerings (*zaōthra*), especially milk (cf. *Yasna*, X, 17; *Vīdēvdāt*, V, 39, VII, 73, XIV, 8, XIX, 9); the mortar used not only for crushing the haoma but also for obtaining fruit juice (*Yasna*, XII, 2, XXVII, 7; *Visprat*, X, 2, XI, 2, XII, 2 and 5; *Vīdēvdāt*, XIV, 10, XIX, 9); and the officiant's breastpiece of cloth, mentioned in the *Vīdēvdāt*, XIV, 8, 9 and XVIII, 1, as well as in the *Yashts*, V, 123. Such objects are difficult to identify among others of similar type or in the damaged state in which they have survived. The great stone vase in the R. Lévy Collection, Geneva, may be a large mortar, but many factors tend to refute this identification. The documentation is insufficient to resolve the question. However, it should be noted that the protohistoric period was characterized by the diffusion of long-spouted vessels, at first of terra cotta and later of metal, which have been found among tomb furnishings in various localities. In the beginning these spouts were designed to imitate a bird's beak and presumably had to do with rites of sprinkling the corpse with liquid or grain. The usual types indicate a progressive evolution away from the theriomorphic model (which sometimes has two eyes alongside the spout) toward completely free forms. If they really were connected with funerary rites, these vases offer a minor but interesting bit of information on ritual practices.

Mario BUSSAGLI

India, southeast Asia, Nepal, and Tibet. In the religions of India rituals have always had a fundamental importance. From the Vedic period on, the rites and ceremonies have been very numerous, some connected with the cult of the family and worship of the gods in the shrines, and other more solemn ones connected with the seasonal celebrations and with such special events as the consecration of a ruler (Aśvamedha), a shrine, a symbol, or a statue of a divinity. Since every phase of human life takes on a religious significance, all stages of existence, from before birth to after death, were marked and accompanied by ceremonies. In every shrine and at every hour of the day the symbol or statue of the god (conceived of as his abode) was an object of worship and received offerings. Although in the Vedic period the rites were primarily sacrificial or oblationary, they later became fundamentally significant of homage and veneration (puja) in Hinduism, Buddhism, and Jainism (qq. v.). This continuous veneration was manifested through ablutions; gifts of flowers, fruit, and rice; and offerings of light, music, perfume, and incense. Thus arose the use of ritual objects and sacred ornaments which became fixed in form, function, and symbolism by tradition and were so perpetuated. The cult accessories later spread into the regions of southeast Asia, Nepal (see NEPAL; NEPALESE ART), and Tibet (PLS. 176, 177; see also TIBET; TIBETAN ART), together with the beliefs transmitted from the Indian civilization. However, the ladles, cups, and vases used in the Vedic age for offerings and libations and to contain the sacrificial liquor (*soma*) or the lustral water used in the consecration of the king (Rājasūya) are known to us only from texts. The cup for the *soma* was shaped like a mortar and was placed near the sacrificial fire. The earliest ritual objects surviving to our time are generally connected with Buddhism, and many of these came to light in the excavations at Sirkap (the Parthian site of Taxila) in the Punjab.

Some of the reliquaries used in the cult of the relics of the Buddha or of other religious figures were of crystal, and others were of metal. Among the earliest objects of artistic value may be mentioned the reliquary of repoussé goldwork set with rubies, from Bimaran, Afghanistan (VII, PL. 465; see also BACTRIAN ART), and the bronze reliquary said to be that of the Kushan king Kanishka. Their decoration is related to the Gandharan style (see GANDHARA) of the 2d–3d century, and the execution reveals a high level of technical skill, which may be noted also in miniature stupas and in bronze and copper incense burners.

Many ritual objects dating from a later period are common to the various Indian religions, which, in fact, have very similar ceremonies. Among these objects are ceremonial ladles, the flared vessel and ewer (lota) designed respectively for receiving and pouring the lustral water, bowls of varying depths, and trays used for offerings of flowers, fruits, and sweets. A small container (*arghya pātra*), shaped like an oval pot with rounded base and a spout, and receptacles of other forms may hold grain, sesame, sandalwood powder, or even water, perfumed and sprinkled with colored powder (PL. 177). The temple lamps show a wide range of types, especially in Nepal (PL. 178). Some have single columnar bases, of varying heights, supporting the container for burning oil or camphor. The finest specimens have the form of a many-branched tree; others hang from a chain, so that they can be swung before the idol. At times a series of lamps hangs from a horizontal rod in the hand of a statuette. Incense burners (*dhūpana*) occur in many forms; some, used in Buddhist ceremonies, have long handles, and their shape, which subsequently was used also in the Tarim Basin and Tunhuang, seems to repeat a type used in Iran and western Asia. Censers often take the form of a footed cup with one or two handles. Other ritual objects include the bell (*ghaṇṭā*) with handle, rung to attract the god's attention; the shell (*śaṅkha*), blown for the same purpose or to mark the end of a ceremony; and another sort of shell, which often rests on a decorated, footed cup and is used to pour water over the idol.

A richly ornamented throne supports the image; on domestic altars were placed statuettes of the gods or the linga, symbol of Śiva. Mirrors (*darpaṇa*) were used to reflect the image of the god so that it could be washed and anointed, particularly when the image was of clay. Candleholders, fans, and umbrellas, often

sumptuous, were arranged around the statues. The processional cars, which in southern India attained monumental proportions, were sometimes of wood with carved panels (IV, PL. 213). Many musical instruments (q.v.) gradually acquired a ritual nature and constituted indispensable temple accessories; such were the bells, gongs, various trumpets, and other instruments accompanying religious dances and ceremonies. Small tubes containing relics and amulets were for more personal use.

Ritual objects offer proof of the high artistic caliber of the minor arts both in India and in the areas to which Indian types of art spread. The workmanship was particularly painstaking, and the appearance was the product of a long tradition that had fixed the forms in relation to function, the appropriate and harmonious proportions, and the motifs of the rich decoration. Most of the ritual objects are of metal: copper, bronze, sometimes brass, and, for the most precious objects, gold and silver were used. Various techniques of metalworking were adopted, and certain ones became local specialties. The decorative motifs were conventional, symbolic, or drawn from the particular iconography of each religion: representations of the Buddha, the bodhisattvas, and Buddhist emblems, which in Tantrism were augmented by figures of deities and demoniac forms, and depictions of the great gods of Hinduism with the personages of their retinue, *śakti*, vehicles (*vāhana*), secondary gods, and genii.

The Indian types recur in the ritual objects of the southeast Asian countries, as well as in Nepal and Tibet, but every region has individual decorative forms. Silver ritual vases from ancient Champa (see CHAM, SCHOOL OF) have come to light in the treasury of Po Nagar; and the conchs, bells, candlesticks, and other objects from the ancient Khmer empire (see CAMBODIA; KHMER ART) are works of outstanding beauty. In the school of Mahayana Buddhism, new importance attaches to the *vajra*, a four- or eight-branched thunderbolt, sometimes linked to a small bell and a sacrificial knife. In Tibetan Lamaism ritual objects include libation bowls, sometimes carved from human skulls, often mounted in metal and elaborately decorated; ceremonial aprons made of a network of bone beads; magic daggers adorned with demonic shapes; thigh-bone trumpets; and tambourines, some fashioned from two half skulls and shaken to mark the intervals of prayers and incantations. Prayer wheels, consisting of a rotating metal cylinder enclosing a fragment of sacred text, come in all sizes. Like all Tibetan ritual objects, these are very well made and embellished with rich symbolic decoration. There are also altar frontals, miniature stupas, the eight Buddhist emblems and the seven jewels, ceremonial staves, portable altars, and crowns for the celebrants, comprising five panels on which the five supreme Buddhas (*pañcatathāgata*) are depicted. Amulet cases, often of silver set with semiprecious stones, are worn suspended on the chest. The costumes of the Tibetan lamas, of embroidered brocade, are sumptuous, as are the caps, which vary in color and shape according to the sect, and the fabrics and painted banners (tanka) adorning the shrines. Masks (q.v.), marked by their intense expression, are worn during dances, which in Tibet, as well as in Indonesia and Bali, are religious.

Madeleine HALLADE

China. The array of ritual instruments and sacred objects in the religions practiced by the Chinese vary enormously from one period or place to another. As early as the pre-Confucian religion, and later in Confucianism (q.v.), although there was no clearly defined priesthood, the celebrant — whether he were head of a state or only the head of a social or family group — wore different clothing and headgear for the various religious ceremonies, including the rite in commemoration of ancestors and funeral ceremonies. Certain texts dating from the first millenium B.C. indicate that many of these ceremonies were accompanied by the music of flutes, drums, and sonorous stones, generally played by blind musicians. The musical instrument sometimes used to summon the worshiper might also be a liturgical instrument, the music being the means of evoking the spirits or gods for the ceremony. Many bronze vases from the archaic period were sacrificial or ritual vessels (PL. 175). The ruler, when obliged to make special offerings, donned a garment of coarse cloth and swallowed powdered jade, as a symbol of purity. As attested by the *Shih-ching* ("Book of Odes" or "Songs"), the princesses who assisted their husbands in making offerings wore their hair dressed in a particular style (*fu*) with special hairpins.

In addition to the official court religion, the rank and file, particularly in southern China, practiced more elementary forms of religious expression and resorted to the magic services of sorcerers (*hsi*), witches (*wu*), and shamans. Some pre-Han texts tell how, before evoking a given divinity, the witch would wash her face with water in which orchids had been boiled, would put on ceremonial robes (probably the same as those of the spirit invoked) and grasp a long, jade-handled sword; musical instruments, in these invocational rites, were one of the means used by the *wu* to achieve a state of trance. Even in rites of this nature, the *wu*'s clothing and jewelry (particularly the pendants) were changed, depending on the spirit to be evoked or invoked. The exorcists (*fang-hsiang-shih*) made use of various instruments in their work, for example, peach-tree branches and brooms for dispelling maleficent emanations during funerals. Clothing always played a fundamental part in Chinese ritual; it often identified the wearer with the previous deceased owner or with the god. In funeral rites, one person was delegated to mount to the roof of the deceased's home dressed in the latter's clothing in order to evoke his ghost; likewise, in the rites for the deceased, his representative (*shih*) — usually one of the younger family members — would don his clothing to receive offerings and eulogies.

A genuine priesthood arose in China only with the introduction of Buddhism and later, under Taoist influence in imitation of the Buddhist clergy, and with this development the rites and the pertinent instruments, ornaments, and ritual objects were more closely prescribed. Among the Buddhist furnishings and objects were the *fo-k'an*, a niche in which images of the Buddha were placed; the *ling-p'ai*, tablets bearing the names of defunct bonzes, usually placed alongside the *fo-k'an*; the *ho-kuei*, a turtle-shaped candelabra; the *huo-shih*, a perfume still (PL. 159); the *hsiang-lien*, an incense coffer; the *fan* (*fo-fan*), a banner; the *t'ien-kai*, or canopy; the *o-chia-t'ung*, or small copper pail, filled with an essence to be offered to the Buddha; the *ju-i*, or scepter; and the *fu-tzŭ*, the deertail fly whisk. There were also a great many musical instruments, such as the *mu-yü*, or wooden fish, a slit drum beaten with a stick to summon the worshipers; the *pao-lo*, a univalve seashell, played to summon the deva; various drums and scrapers; and the *ling*, or little bell. Many of these instruments or objects, as in the case of the *ju-i*, were of genuine artistic merit.

Taoism attached importance to the color of garments worn during ceremonies, as well as to musical instruments, incense for burning on the special tripods, and the writings containing the magical eight trigrams (*pa-kua*) of the *I-ching* ("Book of Changes"). In certain ceremonies lamps and perfume stills were placed at temple doors to show the way to the spirits summoned; golden dragons placed beside the doors were believed to dominate the four regions of space and the spirits thereof. In other ceremonies the Taoist masters held a bamboo rod with nine joints (nine was the number symbolic of heaven); and in still others, the face was smudged with soot and the forehead with mud (the *t'u-t'an-chai*, or fast of mud and soot). However, the Taoist liturgy and the ritual objects used in it varied with the passage of time and the development of separate sects.

Lionello LANCIOTTI

Japan. Shintoism was originally a religion based solely on magical practices and animistic beliefs, but with the introduction of Buddhism and Chinese culture into Japan, it underwent profound changes and adaptations, engendering an elaborate official cult connected with the political system.

In spite of these changes, the ritual objects for both private and official observances remained virtually identical. While Buddhism, with its elaborate ritual, created countless ritual objects, Shintoism, which did not develop an ethical system, metaphysics, or the concept of an afterlife, made use of a very

small number of such objects, because its simple ceremonies are limited to three rites of purification: *harai* exorcism), *misogi* (ablution), and *imi* (abstention). Of these three only the first requires a special ritual object, the *o-nusa*, which consists of a wooden pole on an octagonal base, with little strips of paper (sacred symbols) and hemp fibers fastened to the free end. The *o-nusa*, held in oth hands by the *iwai-nushi* (master of the rite), one of the officiating *kannushi* (Shintoist priests), is waved over a throng of the worshipers first to the left, then to the right, and then once again to the right. The *kannushi* thus performs the purificatory rite, which is preceded by the reading of prayers (*norito*).

Shortly before the rite of *harai* — which is linked to the myth of the bath taken by the god Izanagi in the river Oto, after his exit from the underworld, and the myth of the expulsion from heaven of the god Susa-no-ō — the worshipers make use of various purification objects, including the *katashiro*. This genuine, although uncommon, ritual object consists of a piece of paper shaped like clothing, on which the penitent writes his own sex, with the month and year of his birth; he rubs it against his own body and breathes upon it so as to transfer to it all impurities. The pieces are taken to the temple, gathered together in bundles, and, after the *harai*, placed on a boat and thrown into a stream or the sea.

During Shintoist religious festivals, use is made of the *gohei* (see DEVOTIONAL OBJECTS AND IMAGES), an object related to the *o-nusa*, consisting of a slender stick topped by a strip of white (sometimes black) paper, folded in a special way and in a number of folds which varies according to the sects by which the object is used. In ancient practice the *kannushi* would hold a *gohei* in his hand and touch it during the ceremony in order to induce a state of ecstasy; today a larger version is even carried in processions, attached to the saddle of a richly caparisoned white horse led by a *kannushi*.

Antonio PRIORI

CRISTIAN LITURGICAL OBJECTS. In its earliest stages, Christianity created no new and distinctive liturgical objects; the developments that did occur were of a symbolic rather than instrumental nature, and even the symbol of the cross can be found in earlier religions. For its ritual Christianity adopted both secular and sacred objects, in part from the Hebrew-Oriental tradition and in part from contemporary Western civilization. The appointments are of three kinds, as outlined below: the immovable fittings of the church (altar, baptismal font, pulpit, lectern, etc.); altar furnishings, including the sacramental implements, and other, less sacred objects (aquamanile, censer, bell, etc.); and the vestments and insignia of the clergy.

With the elaboration of the ritual over the centuries, many objects were added or given more distinctive form and significance, so that certain ones acquired a symbolic value outweighing the purely functional. This is true, for example, of the chalice, the candlestick, and the censer (which, along with the aspergillum, derives from pagan usage). Nevertheless, a large number of liturgical utensils have remained substantially unchanged (despite modification in form and size) since they were introduced into the Christian liturgy. Among them are the sacramental vessels (except for the pyx, for which new and original forms were developed during the Middle Ages), for although taken directly from contemporary secular usage, they remain closely bound by tradition because of their symbolic character. Most of the vestments and sacerdotal insignia have also remained essentially unchanged. Introduced between the 4th and 9th centuries, they were based on the robes of the contemporary upper classes. Their form and color were fixed according to the ritual in which they were used and in accord with hierarchic distinctions. Among the few exceptions is the crosier, which in its form and full symbolic significance was taken over from Judaic patriarchal usage.

The altar is undoubtedly the most important and, along with the enclosure of the presbytery, one of the oldest elements assimilated by Christianity. The early Christian altar was meant to represent the table of the Last Supper and was always associated with the traditional concept of the blood sacrifice. Nevertheless its form, furnishings, and subsidiary structures became similar to those of the altars in contemporary tombs and martyriums, combining the idea of the cult of the martyrs and saints with the divine cult in honor of one of the fundamental principles of the faith, afterlife.

Christianity did introduce genuine new features in the sacred furnishings. Of particular artistic interest are the altarpiece, which was produced during a relatively short period but had a prodigious development; the ambo and pulpit, both designed for preaching; and the confessional, which was a later development in Church usage, not precisely established in the liturgy. Reliquaries and monstrances, of no less importance, were created to satisfy a purely Western desire to make the objects of veneration visible. The particular forms given to these vessels, as well as to the tabernacle, were in part a matter of taste and fashion but also originally an instance of the intent to create a symbolic image of the Church. This was true as well, for a certain period, of the *turibulum* and the sacred vessels, which took on forms from monumental architecture and followed the stylistic evolution from Gothic to baroque. Throughout the 19th century earlier styles, especially the Gothic and baroque, were imitated, but with the emergence of the Liturgical Movement at the end of the century an effort was made to bring the best in contemporary art and design into the service of the Church. Where tradition enters into this style, it often reflects the simple forms of Early Christian pieces. Though not accepted by all, this trend has influenced much that has been made in the 20th century.

Usage and liturgical equipment in the various Protestant denominations varies enormously, from a fairly high degree of similarity to Roman Catholic practices to the complete elimination of all the categories of objects mentioned. The relative paucity of Protestant liturgical art is the logical result of certain doctrinal and procedural changes initiated during the Reformation (see REFORMATION AND COUNTER REFORMATION) and of the democratic revolution that went hand in hand with the establishment of many "dissenting," "separatist," and "protestant" groups. Religious dissent in this phase of history, like many others, tended to be linked with political dissent and anti-authoritarianism. Underlying the history of Protestantism is a reliance on the authority of "the Word," rather than on visual representation of sacred subjects or symbols or on the intermediation of human beings or sacred objects between the worshiper and his God. For this attitude the translation of the Bible into the vulgate and the invention of printing, together with the spread of literacy to the common people, prepared the way. With "the Word" thus widely available, the major doctrinal premises of the Reformation profoundly affected the attitudes and behavior of the laity, and a literal reading and close interpretation of particular passages prompted a deliberate return to earlier and simpler forms of observance modeled on the acts of Christ and the disciples as described in the Gospels.

A major point of Reformation liturgical theory was the rejection of the doctrine of transubstantiation. Variously interpreted by the Protestant denominations, this theological controversy has, in the most extreme form of dissent, resulted in the elimination of the communion rite altogether, with all the objects pertaining to it, including the altar. In the many churches that administer the rite, each with its own doctrinal interpretation, practices differ as to whether it is open to all the congregation or only to the professed believers (the confirmed), whether a single chalice or individual cups are used for the wine, etc. In general, the communion is "of both kinds"; that is, the laity partake of both the bread and the wine, as was done also in the Catholic churches in earlier times. The "altar" is, in some churches, only an altar rail; in others, a simple table; and in still others, an altar in the sense described below, with handsome and precious furnishings.

Another important aspect of the Reformation was the rejection of the veneration of saints and of the Virgin. This fact, along with a strict application of the First Commandment, accounts for the prevailing exclusion of images, reliquaries, and figural representations from Protestant churches. Within the churches decoration of the fixed furnishings and liturgical objects

is generally restricted to the symbol of the cross, the monogram of Christ, and Biblical inscriptions, or sober ornamental moldings and the like. Representational art, however, is frequently used in religious publications, where it serves an educational, visual-aids, or graphic-arts purpose unrelated to the liturgy. The books used by the laity in participating in the service (prayerbooks, hymnals, etc.) are usually unadorned.

A third fundamental idea of the Reformation was the rejection of the celibacy of the clergy. This departure from Catholic practice, together with the idea of a return to earlier Christian customs and the leveling desire inherent in the Protestant movement, also led to variations in the usage of the individual denominations. These variations are manifested, for example, in the costume of the clergy both inside the churches and in daily life, so that the dress of the "pastor," "minister," or "preacher" may be identical on all occasions with that of the layman; it may be distinguished only by the clerical collar; or it may include ritual vestments varying according to the ceremonies of the church calendar. The ultimate degree of differentiation is the total elimination of the clergy, with free participation of the congregation in religious observances.

One specific instance of the adherence to original forms is the rite of baptism by immersion, reflecting the baptism of Christ in the Jordan. Certain denominations following this practice retain the early type of baptismal pool in the churches; others follow the Biblical precedent even more literally by holding baptismal ceremonies in rivers. Even in those denominations that practice baptism by aspersion or affusion, particular sentiment is occasionally attached to the use of water procured from the Jordan.

The list of liturgical objects that follows is based on the Catholic rites. It applies to Protestant usage only in part or to a certain degree.

* *

The altar and its furnishings. a. Altar. As a symbolic reproduction of the table of the Last Supper, the altar was originally a simple movable wooden table. Later, with the construction of the first basilicas, fixed altars of stone, marble, or masonry were placed at the end of the nave, at the visual and ritual focal point of the church. Four basic forms can be distinguished: table, hollow coffer or chest, block, and sarcophagus. (The altar as a fixed and integrating element of sacred architecture is discussed in the article STRUCTURAL TYPES AND METHODS.) Examples of portable altars, the use of which was limited though not altogether abandoned during the Middle Ages, include a 7th-century one from the tomb of St. Cuthbert (Durham, Cathedral Mus.). It comprises an oak slab encased in silver plates. Other examples are the Stavelot altar (IV, PL. 409), the one by Master Eilbertus (PL. 168), and the 12th-century wooden altar in S. Maria in Vulturella (Mentorella) near Tivoli. Among the 14th-century altars are the one in S. Maria in Campitelli, Rome, and that in the Cathedral of Capua.

b. Altar frontal (or antependium). The modern altar frontal, or medieval antependium, decorated the front of the block altar and chest altar. Though frontals were later created in a variety of forms and materials, the first ones were carved and decorated stone slabs, such as the one in S. Agnese, Rome, with a depiction of St. Agnes (4th cent.?), and the one in the Cathedral of Pulj (Pola), Yugoslavia, with a cantharus between affronted animals. Other examples include that of Magister Ursus in the Abbey church of S. Pietro, in Ferentillo, and that of Ratchis in the Cathedral of Cividale del Friuli (VII, PL. 373; XI, PL. 326). From the 11th through the 13th century, frontals with mosaic inlay were common in Italy. The decoration generally comprised tondos and friezes around the edges and rarely included figure compositions. There are examples in S. Miniato al Monte, Florence, in the Cathedral of Ferentino, and in S. Maria in Sermoneta, as well as works in Rome by the Cosmati (q.v.), including those in S. Prassede, S. Cesareo, and SS. Nereo e Achilleo. Contemporaneous frontals of precious metals (see GOLD- AND SILVERWORK), ivory, or cloth differ from those mentioned above in that they could be removed. Sumptuous metal ones include the golden altar of S. Ambrogio, Milan, by Wolvinius (III, PL. 63), the chased-gold altar that Henry II (973-1024) gave to the Cathedral of Basel (VI, PL. 263), the partially gilded silver altar donated to Città di Castello by Celestine II in 1143 (PL. 168), and those in the Treasury of the Cathedral of Aachen, in the Abbey church of Klosterneuburg (X, PLS. 315, 318), and in the sacristy of the Cathedral of Ascoli Piceno. Although the only ivory frontal that is still complete is the one in the Treasury of the Cathedral of Salerno, ivory antependia seem to have been fairly common. The use of embroidered or painted fabric for frontals endured longer. Two fine works in the Treasury of the Cathedral of Anagni reveal that Roman embroidery workshops were influenced by the painting of Cavallini. Among the many Tuscan and Venetian works of the 14th century are the frontal in St. Mary, Zadar, and that in the Church of St. Mary, Gdańsk. In Catalonia in the 12th century a distinctive type of painted frontal was developed, on which the figures and decoration are carved of gesso and slightly raised. Generally a figure of Christ enthroned is shown in the center, and both scheme and style reflect the monumental wall paintings of the period.

The silver altar frontal with scenes from the life of John the Baptist, from the Baptistery in Florence (XI, PL. 184), is of great artistic interest, since many leading artists worked on it, including Bernardo di Bartolommeo Cennini, Verrocchio, Michelozzo, and A. Pollaiuolo. Altar frontals embroidered with figures and scenes were common during the Renaissance, and some were made after designs by leading artists. They were primarily of silk or brocade. Noteworthy examples include one by Jacopo di Cambio (Florence, Pitti); one in the Treasury of S. Francesco, Assisi, that may have been designed by A. Pollaiuolo; and others in S. Maria in Vallicella, Rome.

In northern Europe wool was frequently used, and frontals were either in tapestry weave or embroidered. Numerous outstanding examples are found in the major collections of Germany, Switzerland, Belgium, and France. Sixteenth-century frontals reveal a preference for ornate floral patterns rather than figural motifs, a trend that continued in the 17th and 18th centuries, when costly silks and gold and silver threads were used profusely and the raised design was intended to imitate other media (PL. 168).

c. Altarpiece. Used in the West from the 13th century and set up at the back of the altar, the altarpiece, or *ancona*, probably derives its name and function from the medieval *icone*. The earliest ones consisted of a single panel with a figure of the Virgin or a saint, set within a tabernacle or aedicula on the altar. This form was either horizontal or, more commonly, vertical, as in the *Rucellai Madonna* (IV, PL. 286) and in the *Madonna and Child Enthroned* by Guido da Siena (VIII, PL. 185). Many altarpieces were given gables and cusped arches. When the size increased, small subsidiary scenes were added one above the other on either side of the main figure, as in the altarpiece of the Magdalen in the Accademia, Florence, by the Magdalen Master, and the panel of St. Francis in S. Francesco, Pescia, by Bonaventura Berlinghieri (VIII, PL. 181). With the increase in the number of figures and scenes as well as in size, several distinct panels came to be used. They were set on a long narrow projecting base called a "predella," which also had small painted scenes. The altarpiece terminated in a gable or lobed arch. From these beginnings the Italian altarpiece developed along several lines. The Stefaneschi Polyptych (Vat. Mus.), made for St. Peter's in Giotto's workshop, was a prototype that had many varied successors, both of the type in which the central panel predominates, as in the *Annunciation* by Simone Martini (PL. 339), and of the later type made up of many articulated panels, as for example, the back of the Duccio *Maestà* (IV, PL. 285). This type was often given a complex crown, as may be seen in the polyptych of 1319 by Simone Martini (PL. 335).

The basic northern European altarpiece was the triptych with movable wings. Carved wood was used more often than painted panels, especially in German and Flemish works; these became extremely complex, sometimes having several sets of

wings, and the scenes were on a small scale, which favored a wealth of figures and detail. Entire cycles of sacred scenes were often included and framed within delicate architectural elements. A fine example is the altarpiece of the Virgin in the Church of St. Mary, Cracow, by Veit Stoss, completed in 1489. In certain works the main scene in the center is carved and the wings are painted, a system employed in the relatively simple mid-14th-century altarpiece of St. Clare in Cologne Cathedral. Here the carved architectural elements of the interior are almost identical with the painted ones on the exterior. The same practice existed in Flanders and France, as evidenced by the altar for the Chartreuse of Champmol, for which Melchior Broederlam painted the wings about 1399 (Dijon, Mus. des Beaux-Arts). In painted altars the rich variety in form and detail may be seen in Lukas Moser's altar of 1431, depicting the story of the Magdalen, in Tiefenbronn, Germany, and in the Van Eyck Ghent Altarpiece, completed in 1432 (PL. 11; V, PLS. 215, 216), the tradition culminating in Grünewald's powerful Isenheim Altar, which has two sets of wings (VII, PLS. 88, 89). A fine metal altarpiece is the Pala d'Oro in S. Marco, Venice (IV, PL. 405).

In Spain the *retablo* (retable, or altarpiece) enjoyed a unique development in the 16th century. Often very tall, it was divided into several scenes, usually three rows of three. Some retables have only painted scenes, while others combine these with polychromed wooden figures in the round (VI, PL. 357). The complex architectural elements and late Gothic ornamentation compete in importance with the painted decoration.

Altarpieces of outstanding artistic quality, of painted wood, glazed terra cotta, and marble, were produced in Italy in the 15th and 16th centuries. Later the practice of placing the altar directly against the rear wall diminished the importance of the altarpiece, which was all but incorporated into the wall decoration of the apse or chapel. A stage in this process of architectural unification is represented in the Piccolomini Altarpiece in the Cathedral of Siena; although this marble altarpiece is still a distinct unit, it is attached to the rear wall and incorporated in the architectural and decorative scheme of the chapel. Once the unification of both elements was achieved, the *ancona* was replaced by a large painting set into an aedicula, often of polychrome marble and enriched with decorative detail. The baroque aedicula had contemporary architectural features, including paired columns, and angels and allegorical figures. The modern trend toward simplicity has led to the elimination of the altarpiece as well as other forms of decoration, even when the altar is freestanding.

d. Candlesticks. Candlesticks, varying in number from two to six, have had a definite place on the altar since the 13th century. In the early liturgy the acolytes at times held the candles in their hands, as may be seen on the ivory cover of the Drogo Sacramentary (III, PL. 62; Paris, Bib. Nat., Ms. lat. 9428) and in the frescoes in the lower church of S. Clemente, Rome. The cross and candlesticks were set up next to the altar during the service. Such must have been the purpose of two bronze candlesticks of the 5th–6th century, with tripod bases carved in the form of animals (London, Br. Mus.; Trieste, Mus. di Storia e d'Arte). Important later examples are the monumental and sumptuously carved pair of 11th-century candlesticks in the Church of St. Magdalena, Hildesheim, with intricately worked human and animal figures; the one in the Hildesheim Cathedral Treasury (both PL. 167); and the bronze Gloucester Candlestick (VI, PL. 252).

The traditional Hebrew seven-branched candlestick was also widely used in Christian churches. Outstanding examples are in the cathedrals of Brunswick (PL. 170), Essen (10th cent.), Milan (13th cent.), and S. Maria in Vulturella (given by the Fortebraccio family ca. 1424). Enamel and gilded bronze candlesticks were produced in large quantities in the workshops of the Meuse and Limoges in the 12th–14th centuries. Sometimes the base had three supports; sometimes it was circular or broad and lobed. The high stem was interrupted by a heavy knop and a round disk beneath the pricket. The collection of the British Museum contains pieces outstanding for their enamelwork. In Gothic examples the decoration of the foot and knop was richly sculptured and at times imitated contemporary architectural forms.

There are many sumptuous and valuable Renaissance altar candlesticks. The Treasury of St. Peter's has a rich collection of 16th-century works by such artists as Benvenuto Cellini, Antonio Gentili (PL. 167), and Valerio Belli, as well as works based on designs by Michelangelo, Carlo Spagna, and others.

At this time there was produced a type of piece consisting of a kneeling or standing angel holding a small candlestick; not all of them were intended for the altar, however. Examples in marble and in bronze, the work of leading contemporary sculptors, include the two marble ones by Niccolò da Bari and Michelangelo beside the tomb of St. Dominic in S. Domenico, Bologna, and those in the Cathedral of Siena.

The practice of depicting candelabra as an ornamental motif in architecture, clearly of classical derivation, was common in the 15th and 16th centuries, but when used in a religious context these depictions had definite symbolic significance. The motif was very common, appearing in almost every work of architecture, in altars, tabernacles, and funerary monuments.

During the 17th and 18th centuries the number of candlesticks on the altar was increased and finally established at six. There was an enrichment of decorative motifs, in which chromatic values began to outweigh the sculptural sense that had characterized 16th-century ornament. Notable 17th-century examples are the bronze candlesticks in St. Peter's. The altar furnishings by various Roman goldsmiths for the Chapel of São João Baptista in the Church of São Roque in Lisbon, including candlesticks by Antonio Arrighi, are representative of 18th-century work. On the whole, the baroque style continued to be used for altar furnishings until various modern artists began to find significant new forms. Important in this respect are the candlesticks Matisse designed (completed 1951) for the Chapelle du Rosaire of the Dominican nuns in Vence.

The Easter candlestick is known to have been part of the liturgy as early as the 5th century, but no such early examples are known today. In Italy during the Romanesque period monumental marble candlesticks took the form of large columns, carved with scenes and decorated with mosaic inlays and often set on a base made up of two or more animals. There are many outstanding pieces, including two in Rome — the historiated candlestick in S. Paolo fuori le Mura, made by Niccolò d'Angelo and Pietro Vassalletto (III, PL. 477), and one with Cosmati work in S. Maria in Cosmedin — as well as those in the Cappella Palatina, Palermo (VIII, PL. 173), and S. Maria della Pietà, Cori (XII, PL. 259). There are also important candlesticks from the Renaissance period, including that of Doge Cristoforo Moro, of gilded silver (15th cent., Venice, S. Marco); the two by Antonio Pollaiuolo in the Treasury of St. Peter's, Rome; the one by Andrea Briosco (known as Riccio) in S. Antonio in Padua (1507–15), and the two of the early 1520s by Maffeo Olivieri in S. Marco, Venice. Those of the baroque period are noteworthy for their sumptuous ornament and elegant forms (e.g., the silver candlestick, 17th cent., in the Treasury of S. Marco, Venice). The Easter candlestick has kept its traditional form and ornamentation, although those created since the end of the 19th century are usually slightly smaller and simpler.

e. Cross. Along with candlesticks the cross had been given a permanent place on the altar by the 13th century. Previously it had often been set up beside the altar during services and had been carried in processions since early times. As liturgical objects, two types of crosses were important from the 4th century on: the Latin and the Greek. The former, with a long vertical arm and a shorter horizontal one fairly high up, represents the cross of the Crucifixion; because it had a triumphal character, it was often a sumptuous work encased in gold or silver plates and studded with gems. The Greek cross, with equal arms, was fixed on a short handle (as represented in Byzantine ivories from the 5th century on) and was used for benedictions, since it represents the thaumaturgic powers of Christ. Derived from this cross is one that is close to it in

proportions but is set on a long pole terminating in a flared foot. It may be seen in mosaics in S. Lorenzo fuori le Mura, Rome.

The Irish processional crosses are exceptionally beautiful, as may be seen in the Cross of Cong (Dublin, Nat. Mus.), dated about 1123, with its intricate metalwork, gold filigree, and enamel bosses. The top of the staff is in the form of an animal head with the cross set into its mouth.

A 9th-century miniature shows an acolyte holding a cross with a knobbed shaft and tripod stand (Autun, Bib. Municipale, Sacramentary of Marmoutier, Ms. 19bis, fol. 1v) and may well be an early representation of an altar cross. In any case, it is believed that the cross appeared on the Byzantine altar before it appeared on that of the Western Church. Considered one of the first examples is the silver repoussé cross (ca. 3½ ft. tall) in the Lavra, Mt. Athos, probably dating from the 12th century. Perhaps processional and altar crosses were originally interchangeable, the processional cross merely being set on an appropriate base between the two candlesticks on the altar. As early as the 11th century both types began to bear a relief figure of Christ crucified, as on the two Ottonian Mathilde crosses (Cathedral, Essen, 971–82) and the cross of Bernward (Hildesheim, St. Magdalena). Among the few remaining Italian Romanesque processional or altar crosses in metal are the one in Chiusdino (near Siena) and that in Vigolo Marchese (Emilia), both of which have rectangular terminals similar to those of the large painted crosses suspended above the altar.

In the Gothic period a greater number of altar crosses was produced. The terminals are usually lobed and the foot polygonal or lobed; enamel decoration is common. The stem is longer than before and in many cases is interrupted by a knop, often in the form of a miniature *tempietto*, such as the one on the reliquary of the Tree of the Cross in Lucignano (Mus. Civ.) and that of the Cross in the Casa Comunale, Santa Vittoria in Matenano. The processional cross evolved along similar lines, the forms becoming richer and more varied, as for example, the cross by Andreolo de' Bianchi in the Treasury of S. Maria Maggiore, Bergamo, and that in the Cathedral Treasury, Venzone. Many fine crosses were made in the Abruzzi during the 14th and 15th centuries, including the crosses by Niccolò da Guardiagrele for S. Maria Maggiore, Lanciano (1422), and for the Cathedral of Aquila (VI, PL. 265). Venetian work in the 15th century was noted for processional and altar crosses of rock crystal adorned with miniatures. Because of the high quality of their enamelwork, the finest crosses made in northern Europe are those from Limoges. The Gothic and late Gothic Calvary cross depicts the Crucifixion, and the base is shaped to represent Mount Golgotha (sometimes with the skull of Adam) with the figures of the Virgin and St. John. At times these two figures are set on secondary arms branching out from the high stem, as in the cross in the Cathedral of Salzburg, where these branches are formed to imitate tree branches, and in the 15th-century work for the altar of the Baptistery, Florence (VI, PL. 265).

During the Renaissance niello work and more elaborate sculptural decoration, especially of the foot, characterized the production of crosses. Outlines became simpler, forms more static, and the figure of Christ more realistic, as may be seen in the many altar crosses in the Castello Sforzesco, Milan, and in the Treasury of St. Peter's, Rome. While, in this period and the succeeding one, crosses were brought stylistically closer to the other altar furnishings (e.g., candlesticks), in the baroque period there was a return to a more exuberant use of color through the employment of a wide variety of materials, including crystal, *pietra dura*, and coral. Thereafter, forms and decoration gradually became simpler. A notable example in the contemporary production of sacred art is the cross made by Matisse (completed 1951) for the Chapelle du Rosaire in Vence.

f. Altar cards. Since the 16th century the furnishings of the altar have also included the three altar cards that present to the officiant of the Mass certain passages and prayers in the service. The altar cards are generally placed inside a carved and gilded wooden frame. The frames were particularly rich in ornamental motifs in the baroque period, as for example the 17th-century silver repoussé frames in the sacristy of S. Maria della Steccata, Parma. Today the altar cards, notably simplified, are contained in smooth gilded wooden frames or in brass frames.

Other church furnishings. As was the case with the altar, so other objects connected with Christian worship that were derived from secular furniture soon became fixed elements of sacred architecture. Although some of these appurtenances (e.g., the ambo, pulpit, and choir stalls) fall outside the context of liturgical objects and within that of architecture (see STRUCTURAL TYPES AND METHODS), a few may be briefly mentioned here.

The ciborium is of ancient origin as a symbol of cosmic power. It became part of Christian church furnishings in the form of a flat or vaulted canopylike structure supported on vertical elements, according to the tradition of the Byzantine East, which had employed the ciborium as a symbol of imperial dignity. This symbolic canopy, which soon became a fixed stone structure, was originally used in the tombs of particularly venerated saints and probably also in the martyriums of Near Eastern sanctuaries. Its use over the altar seems to have resulted from the spread of the cult of the martyrs, as well as from the entry of symbols of imperial power into the liturgy. In the East, vaulted ciboria are documented by illustrations in Early Christian and Byzantine manuscripts (Vienna Genesis, Vienna, Nationalbib.; Menologion of Basil II, Vat. Lib.; etc.). The fragments of a ciborium from 514–23 found in S. Clemente, Rome, are evidence of its early use in the West. The Romanesque ones have pyramidal roofs and are often decorated with Cosmati work or with sculpture (I, PL. 462).

The baldachin (a term sometimes used interchangeably with "ciborium") is generally a movable canopy consisting of a wooden structure or a wooden armature over which fine fabric is draped. The earliest reference is in a 12th-century manuscript in the Cathedral of Notre-Dame in Paris. The baldachin became common in Europe during the 13th century, being hung from the ceiling or, if the altar was set against a wall, attached to the wall.

Another type of baldachin is used during processions to protect the priest who carries the Eucharist. It has no frame at the top, so that the cloth is directly attached to the four or six supports. Fine 18th-century silk or velvet baldachins embroidered in gold and silk are the property of many churches, including S. Petronio and S. Domenico, Bologna.

The holy-water font (stoup), a basin on a stand for the holy water, is set near the entrance of a church. The font derives from the cantharus (basin) that stood in the atrium of Early Christian basilicas and was used for the purification of the faithful. In the baroque period the font was attached to the wall instead of having its own base. At this time some movable fonts of precious metal were also made.

The baptismal font originally consisted of a large basin at floor level — usually with marble or mosaic trim — with steps leading down into it. As the practice of immersion baptism was abandoned, the font became progressively smaller, taking the form of a large bowl that was either set directly on the floor or supported by a pedestal. The metal fonts made in northern Europe are most impressive, for example, the brass one by Renier de Huy in St-Barthélemy, Liège, dating from the first quarter of the 12th century. It is cylindrical, covered with reliefs, and supported on 12 bulls (V, PL. 319). The later font in the Cathedral of Hildesheim (PL. 167) is wider at the top than at the bottom and is supported by four kneeling allegorical figures. Also worthy of mention is the 14th-century bronze one formerly in the Church of St. Maria in Wismar. Similar examples in wood and stone are preserved in Sweden.

The official position of the cathedra, or bishop's throne, is at the back of the apse. Its shape derives not from the Greek *kathedra* (seat or bench), as its name would seem to indicate, but from the *thronos* (chair of state), and, like the latter, it has a high back and arm rests. Examples of Early Christian cathedras have been preserved in the Basilica Eufrasiana in Parenzo (Poreč), Yugoslavia, and in S. Sabina, Rome. Since most early cathedras were heavy stone structures, the "throne of Maximian" in Ravenna (V, PL. 432) is unique in that it is made up of carved ivory plaques with figures of saints and Old and New Testament

scenes. The Cathedra Petri, in St. Peter's, placed by Bernini in a monumental bronze and stucco setting (II, PLS. 135, 275), goes back, at least in part, to the 8th–9th century. Important cathedras of the Romanesque period include those in S. Clemente, S. Balbina (III, PL. 477), S. Lorenzo fuori le Mura (III, PL. 483), and S. Sabina, Rome, as well as the one by Vassalletto in Anagni. Southern Italian cathedras usually have sculptured decoration and are often supported by animals, including elephants (influenced by Islamic art), as in the one made by Romualdus, in the Cathedral of Canosa di Puglia (VIII, PL. 172); caryatids, as in the Throne of Elia, in S. Nicola, Bari (XII, PL. 261); and lions, as in the cathedra in the Cathedral in Calvi.

From the Gothic period few complete cathedras remain. The greater use of wood rather than stone is a contributing factor, as is the practice of placing the altar at the back of the church. Noteworthy is the cathedra of Nicholas IV (reigned 1288–92) in the cloister of St. John Lateran. The flanking columns are twisted, with bands of mosaic inlay, and there are terminating pinnacles. An example of the late Renaissance cathedra is the one of St. Robert Bellarmine in S. Maria in Via, Rome. Though cathedras became less and less important, some wooden ones upholstered with costly fabrics are known from the 18th and 19th centuries, and there are also simpler later examples.

Ritual objects. a. Chalice. The chalice was originally classified according to the ritual functions of consecration of the wine, of administering the Eucharist, and of giving milk and honey to the baptized. Over the centuries the chalice has varied greatly in form and material. An early type with two handles is seen in the fresco of the *Fractio panis* in the Catacomb of Priscilla, Rome (III, PL. 93). This type usually had a thick foot and a flaring upper part, as in the mosaics in S. Vitale and S. Apollinare in Classe, Ravenna.

A second type, which was first made of glass and later of metal, comprises a hemispherical or almost cylindrical cup, without handles, set directly on a small conical foot; this type is documented by the glass chalices depicted in two floor mosaics in the Bardo, Musée Alaoui, in Tunis, and by several metal chalices found in Syria (Br. Mus.; Louvre), as well as by the Chalice of Antioch (PL. 162), decorated with vine scrolls and figures in relief (though it is not certain that this piece had a liturgical use). For a long time the Byzantine Church used both forms simultaneously. In the Treasury of S. Marco in Venice are examples of both types, dating from the 10th–11th century and showing great variety: cups of glass, crystal, onyx, and agate are set in silver-gilt mounts embellished with enamels, niello work, and precious stones. The splendid late-14th-century chalice of Manuel Palaeologus (1391–1425) in the Vatopedi Monastery, Mt. Athos, is a broad, low onyx cup with elegant dragon-shaped handles revealing the reciprocal influence of the two original types.

In the West, too, both types existed until the 10th century, when the type with two handles disappeared. Outstanding early Western chalices with handles include the one from the Gourdon Treasure (Paris, Cabinet des Méd.), which may be from the 6th century; the Ardagh Chalice, possibly dating from the 9th century (I, PL. 285); and the 10th-century chalice of St. Gauzelin (Cathedral of Nancy).

Derived from the handleless Syrian type are the curious wooden chalice in S. Michele, Pavia; the Tassilo Chalice (I, PL. 287); the chalice of St. Chrodegang (8th cent.) in The Hermitage, Leningrad; and the chalice (ca. 10th cent.) from Trewhiddle, Cornwall (Br. Mus.). Until the 13th century the chalice was rather low, with a broad cup and a conical foot inserted directly in the knop. Subsequently the cup became longer and was set on another element; the stem, usually polygonal, became longer, and the knop more prominent and set farther from the polygonal or lobed foot. Early examples of the new style are the silver-gilt Dolgelly chalice in the National Museum of Wales, Cardiff (mid-13th cent.), signed by Nicholas of Hereford; the 14th-century chalice in Klosterneuburg; the chalice of Agilulf and Theodolinda, with a sapphire bowl, from the 6th century (PL. 163); and some Spanish chalices of the period, executed with great liberty of invention. Noteworthy French and Italian chalices were produced, the former including the chalice of St. Remi (PL. 160). Among the outstanding Italian works are those made in Siena, including the one Guccio di Mannaia executed in 1290 for Nicholas IV (Assisi, S. Francesco, Treasury), one by Cataluccio da Todi (Perugia, Gall. Naz. dell'Umbria), a chalice by Giovanni di Jacopo (Messina, Cathedral), and one by Ciccarello di Francesco (PL. 163). The chalice presented to the Cathedral of Monza by Gian Galeazzo Visconti in 1396 exemplifies an important innovation that was to become comparatively common during the next century: the knop comprises a group of miniature Gothic tabernacles. There are numerous 15th-century chalices characterized by a richer repertory of decorative motifs.

The Renaissance saw the establishment of the conventional chalice — a bell-shaped cup set into a bulb, a tall smooth stem with a knop in a variety of forms, and a flared lobed foot. Decoration of enamel, gems, and other polychrome elements was replaced by sculptural motifs (e.g., foliage, figures) that are an integral part of the metal structure. Outside Italy at this time Gothic elements continued to appear, for example, in the chalices in the Cathedral of Wrocław (Breslau) and in St. Andreas in Düsseldorf.

In 17th-century baroque chalices the emphasis on three-dimensional decorative motifs is much greater, and sometimes color plays an important part, as may be seen in the gold and enamel chalice of the Emperor Ferdinand III in the Abbey of Monserrat. In harmony with the general trends of the 18th century, ornament on chalices became lighter (e.g., the Stuart chalice, in the Treasury of St. Peter's, Rome). Modern works comprise greatly simplified forms, and ornament is reduced to a few traditional Eucharistic symbols such as the wheatstalk and the grape cluster. Noteworthy examples are the chalice designed by Karl Holey in the Abbey of Zwettl (Austria), and the one in the Treasury of St. Peter's, with a spherical bowl decorated with diamonds and rubies, made by Nottbrock in 1933 and presented by the Prince of Wittelsbach.

b. Paten. Chalice and paten form a pair of liturgical objects. The paten is a round, flat plate or shallow vessel with a broad rim. In early times it varied considerably in size, form, and use; this contributes to the difficulty of ascertaining which of the surviving plates were meant for ritual use. Perhaps the earliest examples were glass, as suggested by the 14th-century gilded glass dish from Cologne (London, Br. Mus.) and the few unclear depictions in Ravenna mosaics. Among the earliest metal examples are those from Syria, with crosses, busts, and figures in niello or relief (paten with the Communion of the Apostles, from Stuma; PL. 162), those from Constantinople and Cyprus (two patens with monograms, from the Lampsacus Treasure; London, Br. Mus.), and others from Canoscio, Carthage, and Nicosia. The larger ones, however, were probably intended for the offerings of the congregation and are not true patens. Byzantine art produced notable patens with figural decoration, including the Halberstadt paten (PL. 162), with the Crucifixion depicted; that of Pulcheria, in the Monastery of Xiropotamou, adorned with reliefs in ophite; and numerous others in glass, agate, onyx, and alabaster, with silver settings, adorned with pearls, precious stones, and sacred inscriptions (several in the Treasury of S. Marco, Venice; PL. 162). The Treasury of S. Marco also preserves a curious glass paten (10th–11th century) with a silver handle set with gems. Later the Eastern Church developed a special type of paten set on a high foot or pedestal. This was the panagiarion, used for the holy wafers (PL. 173). In the West the usual form was a round plate with a lobed central section that was frequently decorated with a niello or enamel bust of Christ, the Hand of God, or the Lamb of God. The 10th-century paten of St. Gauzelin in the Cathedral of Nancy is an outstanding example. The *Liber Pontificalis* mentions patens of precious metal that were even hexagonal, and a rectangular paten with a cross in the center and a border of glass paste and other types of stones was found with the Gourdon chalice (Paris, Bib. Nat.). Later, patens were

produced as mates to chalices and were decorated with motifs from the same repertory, as in the examples in St. Godehard, Hildesheim, from the late 12th century; in the Cathedral of Worcester, from about 1250, showing the Hand of God; the one belonging to the Dolgelly chalice in the National Museum of Wales, Cardiff, with a figure of Christ enthroned; and the one with a Crucifixion that belongs with the Spanish Pelagius chalice of the 13th century (Paris, Louvre). Most Italian patens of the period are less ornate, and many even lack the lobed area, for example, the mate to the so-called "Chalice of St. Francis," in Assisi, Treasury of S. Francesco, and an enameled one in S. Lorenzo, Scala. More elaborate is the paten that belongs with the chalice by Cataluccio da Todi, in Perugia (Gall. Naz. dell'Umbria). In modern times patens have become smaller and are usually unadorned, as are contemporary chalices.

c. Pyx. The pyx, which holds the reserved Sacrament, has undergone extensive modifications of form over the centuries. Early Christian pyxes were usually small cylindrical boxes (with flat lids) carved of bone or ivory (VIII, PL. 240). Numerous Syrian and Egyptian examples dating from the 4th through the 6th century are known. Also used as pyxes, particularly in the succeeding period, were boxes that were intended to hold incense, decorated with secular scenes. Small silver capsae were also used and, later, so were cylindrical boxes of wood or ivory, of Islamic workmanship. According to the *Liber Pontificalis*, the pyx was kept in a *turres*, of unknown form and origin.

For a time pyxes in the shape of a dove were suspended above the altar by a chain from the ciborium. Perhaps the earliest date from the 10th century. Metal examples are preserved in S. Nazaro Maggiore, Milan (13th cent.), Sto Sepolcro, Barletta (12th cent.), and in Paris (PL. 164), as well as in the Museo Nazionale, Florence, and the monastery in Göttweig, Austria (both 12th cent.). In 11th–12th-century frescoes there are pyxes in the form of two-handled vases suspended over the altar in place of the dove-shaped ones. At the beginning of the 13th century the workshops of Limoges were producing cylindrical pyxes with conical enameled lids. Later in the 13th century the pyx began to resemble the chalice, in that it was given a broader spherical bowl set directly on a conical foot, and either a conical or spherical lid terminating in a small cross or knop. (When the container for the reserved Sacrament is of this kind, it is generally called a "ciborium.") Among the earliest examples are the one from Montmajour, signed by G. Alpais (PL. 171), and one in the British Museum; both are decorated with enamels and gems. During the 15th and 16th centuries the pyx sometimes took the form of the Gothic *tempietto* with features of the monstrances used in the Ambrosian rite. Thereafter, pyxes came to resemble chalices more closely in style and form but retained the crowning cross and large broad bowl.

d. Monstrance (*ostensorium*). The monstrance is another type of container for the Sacrament and one of the latest additions to the liturgical vessels, having been introduced only in the 14th century with the Feast of Corpus Christi. Most of the few extant medieval examples are shaped like the architectural Gothic reliquary and are supported by a tall stem with a knop and flared foot clearly derived from contemporary chalices. Examples of this first type of monstrance, which was soon discarded and continued in use only in the Ambrosian rite, are in the Cathedral of Seo de Urgel (PL. 166); S. Ambrogio, Milan; the Castello Sforzesco, Milan; and the cathedrals of Rossano and Benevento. In Renaissance monstrances the architectural elements resemble those of the contemporary *tempietto*. Gothic pinnacles, spires, and buttresses are replaced by delicate columns, tympanums, and cupolas, as may be seen in examples in S. Antonio, Peia, and S. Pancrazio, Corlaga. Ambrosian monstrances made in Spain and Sicily in the 14th century are impressive architectural creations that often reach a height of 6 or 7 ft. In the 15th century another type of monstrance was introduced in the Roman liturgy. In place of the *tempietto* its terminal had a glory of golden rays, which was sometimes adorned with enamels and gems. Early examples of this second and extremely popular type are in the Musée de Cluny, Paris; the Museo dell'Opera del Duomo, Siena (both PL. 166); S. Domenico, Palermo; and the Museo Pepoli, Trapani. In many later examples the stem represents saints or angels who support the glory, as may be seen in monstrances in the Residenzmuseum, Munich (PL. 166), S. Luca in Padua, S. Giovanni in Stilo, and the Cathedral of Castel di Sangro. Baroque monstrances are more complex and have more variety in their decorative motifs (II, PL. 219), but the basic forms of both types remain the same. During the 17th and 18th centuries such renowned goldsmiths as Giuseppe Filiberti, Angelo Spinazzi, and Sebastiano Juvara made splendid monstrances with rich plant motifs around the glory and with adoring angels. Outstanding examples of that period are in the Church of S. Alessandro della Croce, Bergamo; S. Lazzaro, Piacenza; Monte Vergine, Messina; and the Museo Diocesano in Palermo. With neoclassicism monstrances became more austere, but the basic scheme of that used in the Roman liturgy remained the same.

e. Ampulla. The cruets for the wine and water, holy oils, and aromatic essences used in the Mass resemble similar contemporary vessels for daily use. They usually have a narrow neck, amphora-shaped body, and a handle. In Early Christian times the wine offered for the sacrifice was kept in amulas, elegant small amphoras, usually of metal. Some silver examples survive that were probably made in Syria and Cyprus. One in the Vatican Museums is decorated with a band of busts in medallions and may date from the 5th century. Other receptacles serving the same function and with similar decoration, though without handles, include a vase from Emesa (mod. Homs; Paris, Louvre) and small rectangular glass flasks with crosses in relief on the sides (e.g., one in London, Br. Mus.). Designed for keeping the holy oils were the *eulogiae*, which were usually small flasks of a squat spherical shape, in silvered lead or terra cotta, with stamped inscriptions; there are many examples from Palestine now in collections in Monza and Bobbio. These flasks, dating from the 6th–7th century, bear depictions of the Crucifixion, the Exaltation of the Cross, the Anastasis, or the Ascension, among others, and are of immense interest for the study of traditions of iconography. Other examples bear the image of a saint with the symbol of martyrdom or with a cross, since the oils held in these receptacles were taken from the lamps that burned at the sepulchers of certain saints. Many Byzantine examples of the 10th and 11th centuries are in S. Marco in Venice. These include pieces made of glass, agate, and onyx with silver mounts. They vary considerably in shape, some being small squat vessels, others elongated ewers of fanciful silhouette. Noteworthy Renaissance examples include a pair in the Louvre, for water and wine; of Venetian workmanship, they are made of crystal with mounts of silver and handles in the form of dragons. In modern times the form and decoration have varied only slightly.

f. Aquamanile and basin. The aquamanile, similar in form to the ampulla, but of different size and material, holds the water for the washing of the priest's hands during the Mass. Its liturgical application is very old, although it is difficult to identify early examples, since secular vessels were probably also employed in the Mass. But it is certain that a heavy, dark bronze amphora from S. Lorenzo, Rome (11th cent.?; Vat. Mus.), is a liturgical object, as is a 10th-century Islamic aquamanile of rock crystal in the Victoria and Albert Museum, London. In S. Marco are preserved fine large Byzantine aquamaniles of crystal, agate, and onyx. In the Romanesque period the Rhine workshops produced aquamaniles in the shape of lions and fantastic animals, and some of them were undoubtedly used in churches, for example, the one from the Cathedral of Grado (Viterbo, Mus. Civ.). The most important workshops were located in the Rhineland, at Limoges, and at Dinant (PL. 164). The aquamanile in the form of a horse with rider was an additional design later introduced by the Dinant workshops. The design of the basin that caught the used water was always comparatively simple. Among the oldest basins is the 15th-century example of German workmanship in the Cathedral of Atri.

In the Renaissance the basin and aquamanile, reserved for pontifical and special Masses, were heavier and were adorned with chased or repoussé floral motifs and figures. Notable examples of basins of the baroque, neoclassic, and modern periods are preserved in the Treasury of St. Peter's, Rome, and in the Museo dell'Opera del Duomo, Siena.

g. Liturgical spoon. The liturgical spoon had various uses in the old liturgy — adding water to the wine in the chalice, taking the Host from its container, filtering the wine from the ampulla into the chalice (in this case, a perforated spoon), and administering the Sacrament. Spoons seem to have been used during Communion in Syria by the 7th century; from there their use spread to Constantinople and became a part of the Greek Orthodox rite. Therefore it is difficult to ascertain the specific function of the many spoons found in the various treasures that have come to light, or even to be certain that all of them had a liturgical use (for example, the spoons found at Kyrenia in Cyprus), although some bear Christian inscriptions (e.g., spoons dated 360–400 in Dorchester, Dorset County Mus.). The handle is usually thin, and the concave part is elongated (e.g., those from Carthage, now Br. Mus.) or elliptical; they bore the names of the apostles (e.g., those from the Lampsacus Treasure, Br. Mus.). Pierced spoons, or strainers, were used until the 17th century. Noteworthy examples include those of gilded silver from the Traprain Treasure (Edinburgh, Nat. Mus. of Antiquities of Scotland). The golden spoon known as the "Coronation Spoon" (perhaps 12th cent.), in the Tower of London, seems to have had a liturgical function. The late medieval examples with the Madonna and apostles depicted on the handle were secular objects and also served as Christmas gifts.

h. Offering basin. As early as the 5th and 6th centuries there were large disk-shaped vessels that, because of their repoussé decoration, cannot be considered plates or patens. They were probably used for collecting the Host. Rather large bronze basins, produced by Rhine workshops in the 12th century, bear holy scenes and stories of the saints (with inscriptions). Many examples are preserved in several German museums and in the British Museum. Also designed to collect offerings (but not strictly related to the liturgy) are vessels of nonprecious metals (e.g., pewter), adorned with repoussé crosses or busts of Christ and saints. These have been produced throughout western and central Europe in modern times.

i. Reliquary. Of various forms and materials, the reliquary, a container for holy relics, owes its origin and extreme popularity to the cult of the martyrs (see DEVOTIONAL OBJECTS AND IMAGES). There are ancient Syrian examples in the form of small stone sarcophagi. These sometimes had holes for oil, which was later distributed among the worshipers. An example is the reliquary of Sokahni (Syria), from which is derived a small urn in the Cathedral museum, Verona; this urn has small arches and is decorated with affronted peacocks (second half of 6th cent.). When reliquaries became smaller, boxes of precious material were used. Some of these were of secular origin and bore pagan depictions of the Roman theater. The most common type of Early Christian reliquary was the small casket or coffer. Among the many extant examples are the ivory casket generally referred to as the "Lipsanotheca of Brescia" (VIII, PL. 240); the 5th-century cylindrical gold container found under the altar in Pulj, and the chased silver casket with busts in medallions and with inscriptions, in the Cathedral of Grado (5th cent.). Fourth-century examples in the form of a cross, elaborately worked, are preserved in the Vatican Museums. Byzantine gold- and silverworkers created the various *staurothekes*, reliquaries in the form of a small richly adorned chest containing a gold cross, inside which is preserved a relic of the Cross (e.g., enameled examples in the cathedrals of Limburg an der Lahn, 10th cent., and Esztergom, or Gran, Hungary).

Smaller but no less admirable are the 13th-century enameled medallions containing relics (e.g., in Washington, D.C., Dumbarton Oaks Coll.). Reliquaries were designed in various forms in the Middle Ages. The most common type in the West was the small chest or coffer of fine metal with repoussé or niello ornamention and decorated with enamels and gems.

In Germany in the 12th–13th century fine reliquaries were produced in the form of miniature temples with Byzantine and Romanesque-Gothic architectural elements. Examples include that of St. Victor, in Xanten (1129), by Master Eilbertus; the so-called "Tower Reliquary" in Darmstadt, Landesmuseum; the Three Kings reliquary (VI, PL. 388; X, PL. 316); and one in the Treasury of the Cathedral of Aachen (completed before 1238). The architectural type of reliquary was also used in Italy, beginning in the 13th century; it had decidedly Gothic elements. Noteworthy examples include the one containing garments of St. Francis (Assisi, Treasury of S. Francesco); the reliquary in the Treasury of S. Nicola, Bari; that in Savona Cathedral; and the Reliquary of the Holy Corporal, in Orvieto (VI, PL. 382). In addition, there are traditional reliquaries in the form of chests and crosses (e.g., in the Treasury of S. Maria Assunta, Padua; the reliquary of the Tree of the Cross, in Lucignano, Mus. Civ.). Another type created in this period, one which enjoyed great popularity later, is the bust reliquary of a saint, with a small aperture on the chest. Bust reliquaries were generally made of gilt and painted wood, sometimes of metal. The most noteworthy include the bust reliquaries of St. Agatha (Catania, Cathedral), St. John Gualbertus (Passignano, Badia), St. Zenobius (Florence, Cathedral), St. Januarius (Naples, Cathedral), St. Ermagora (Gorizia, Cathedral), and St. Donatus (Cividale, Cathedral), in which characteristics of the various regional schools of sculpture are evident. In France bust reliquaries were used at least as early as the 13th century. These were produced in the Limoges workshops and include that of St. Baudime (church at Saint-Nectaire) and others in the British Museum; they are richly enameled. In the metal reliquaries produced in the workshops of the Rhine and the Meuse, the architectural element was ever more important. Later, French influence caused this element to be reduced in favor of figural work. Rectangular or polygonal reliquaries, of ivory or metal, continued to be produced throughout the 15th century (e.g., examples in S. Petronio, Bologna, and S. Nicola, Bari). More common in this period were reliquaries of glass or precious metal in the form of a chalice, or *theca*, supported by angels and ornamented with motifs derived from contemporary architectural forms (e.g., the reliquary of St. Louis, King of France, Florence, Mus. degli Argenti, and many others in the Treasury of S. Marco, Venice).

Reliquaries in the form of a Renaissance *tempietto* or tabernacle, made in Italy during the 15th and 16th centuries, are important in relation to the major artistic trends of the time. Outstanding examples include the reliquary of the "Libretto" (Florence, Mus. dell'Opera del Duomo); the reliquary containing the wedding ring of the Virgin, in the Cathedral of Perugia; and the numerous creations of a certain Pietro of Padua and of Bartolommeo da Bologna. A comparable Spanish piece is the early-16th-century reliquary in the Cathedral of Cádiz. Other types of reliquaries were made in the 16th century, especially "anatomical" ones, such as polychromed busts (e.g., in S. Maria Novella, Florence) and other parts of the body (e.g., arm reliquary of St. Magnus and leg reliquary of St. Theodore, both in Treasury of S. Marco, Venice). During the baroque period small coffers were the most common type, and they were given rich carved and painted decoration. Heavy, ornamented thecas and amphora-shaped reliquaries carried by angels were also common. Later reliquaries were usually in imitation of baroque models, but traditional coffer and urn-shaped reliquaries continued to be produced.

j. Bell. Liturgical bells are here distinguished from other bells on the basis of origin and decorative motifs. The practice of ringing a bell to emphasize certain parts of the Mass became usual during the 13th century, although it must have been fairly common earlier. The oldest bell that is known to have been used in the church services is a bronze bell (12th cent.) in the Cathedral of Reims, bearing the symbols of the Evangelists. Liturgical bells dating from the 15th–16th century are

preserved in the Cathedral Treasury, Monza, and in the Castello Sforzesco, Milan. The liturgical bell ranges in shape from a truncated cone (the most common type) to a hemisphere; a few are even square. Various materials were used, including gold, silver, bronze, copper, and iron; there are also examples in glass, porcelain, and terra cotta. A double or multiple bell, a form which is still in use today, is called a *cymbalum*. Good examples of various kinds of bells are in the Museo Nazionale in Florence, the Victoria and Albert Museum in London, and the Treasury of St. Peter's in Rome.

k. Censer (*thurible*). The burning of incense was taken over from pagan cults at an early date. The first Christian censers, small metal containers with or without lids, are known from Early Christian representations. According to the *Liber Pontificalis*, Constantine the Great donated fine metal censers to the Church of St. John Lateran. A cylindrical censer without a lid and hanging by three chains is depicted in the mosaics of S. Vitale, Ravenna (II, PL. 440). Eastern and Byzantine censers are usually potbellied vases on low round pedestals, or small hexagonal containers without feet, and are suspended from chains; an example is the hexagonal 6th-century silver censer from Cyprus (Br. Mus.), with a bust in a medallion on each face. A few censers with long straight handles are also known. In the West very simple censers of geometric form, sometimes spherical, were used until the 11th century. Occasionally censers were made in the form of a human being or imaginary animal, with floral motifs in repoussé; such pieces never had covers. An outstanding 12th-century example of this type is the hemispherical censer in Lille (Mus. B.A.), attributed to Renier de Huy or a follower. In another type that became important during the Romanesque period and continued throughout the Gothic, the lid was transformed into an architectural structure that, according to Theophilus (*Schedula diversarum artium*, III, lx, lxi), is a symbolic allusion to the ideal structures of the Heavenly Jerusalem. Examples of this type, adorned with tympanums and small perforated turrets, and sometimes decorated with plant motifs and the symbols of the Evangelists, were made in the metal workshops of northern Europe. Two elaborate 12th-century censer tops in the British Museum show that the type had also spread to England. All extant examples are of bronze, some gilded, but early inventories indicate that gold and silver censers were also made. From the 13th century on, the covers (set on hemispherical vases) became more decidedly Gothic, with spires and pinnacles, as may be seen in the Ramsey Abbey Censer (PL.165) and those in the Cathedral Treasury, Mileto (late 14th cent.), in the Cathedral of Rossano (15th cent.), and in S. Antonio, Padua. Censers frequently are depicted in 14th- and 15th-century painting and sculpture: in the tomb sculpture by Arnolfo di Cambio in St. John Lateran (I, PL. 465) an acolyte is seen blowing into one; singing angels are often shown holding them. Censers are also used as decorative motifs on marble sepulchral monuments, altars, and tabernacles. Renaissance architectural elements supplanted Gothic ones by the 16th century, as may be seen in the censer in S. Giovanni, Stilo, and the one attributed to the workshop of Benvenuto Cellini, in the Cathedral of Fidenza. In the baroque period the repertory of architectural and ornamental motifs used in censers was enriched. Noteworthy 17th-century examples are those in the cathedrals of Fidenza and Rossano. The 18th-century censer and incense boat of chased and gilded silver in Bologna (Metropolitana; PL. 165) and the set in S. Maria Maddalena, Norano Calabro, are also of interest. The traditional censer with various kinds of covers and supported on chains is still commonly used in liturgical ceremonies.

l. Incense boat. The incense boat, a metal receptacle for carrying incense, usually accompanies the censer and is decorated with the same motifs. In Early Christian times cylindrical ivory boxes (acerras) of pagan origin and tradition were used as incense boats. Later, long flat metal boxes were used, each with a small foot, first without lids, then with lids. Their resemblance to a boat has led to the suggestion that they symbolize the Church. The earliest extant examples are very simple pieces made of base metals. More interesting are those shown held by angels in many Romanesque reliefs. A fine Byzantine work is the incense boat of sardonyx and mother-of-pearl in the Treasury of S. Marco, Venice. In the Renaissance the form of the incense boat corresponded more and more to that of an actual boat. Some works are faithful to such details as masts and rigging, for example, the 15th-century Venetian incense boat in the Museo Antoniano, Padua, and the early-16th-century gilded-silver and mother-of-pearl boat in the Treasury of the Cathedral of Chartres (PL. 165). This type of incense boat, simplified and adapted to meet practical needs, has continued in use to the present day.

m. Aspergillum and aspersorium. It is one of the oldest Christian rites to sprinkle objects and people with holy water. In the Early Christian period a branch of olive, hyssop, myrtle, or laurel was simply dipped into the holy water, and for certain ceremonies this is still the practice. Metal aspergilla, being more practical and convenient, were gradually adopted. These consisted of a long handle, usually metal, that terminated in either a pierced sphere or a clump of white bristles. This fundamental type continues to be used, having undergone only minor alterations.

Aspergilla from various periods, together with their buckets, have been preserved in the Treasury of the Sé Nova (New Cathedral), Coimbra, Portugal.

The holy water is kept in a bucket (aspersorium) that serves as a portable holy-water font. The oldest extant examples (10th cent.) are of ivory. They are rather squat and round, as is the one in the Treasury of the Cathedral of Milan, with figures of the Virgin and the Evangelists. The 11th-century one, from the time of Otto III, in the Cathedral of Aachen is octagonal with two registers of figures on each face and is decorated with gold mounts. The handles were usually in the form of affronted or addorsed dragons, serpents, and other animals. From the 11th century on, aspersoria were almost always metal (steel, silver, bronze, copper) but occasionally *pietra dura*. Outstanding examples are the bronze bucket in the Cathedral of Speyer (12th cent.); one of glass in the Treasury of S. Marco (13th cent.); and porphyry and jasper buckets in the Louvre and elsewhere. Gothic buckets are larger and more soberly decorated (figural depiction is rare) and are of more varied forms. Many have the shape of small cooking pots and are set on a heavy circular base or on three small feet, sometimes in the form of animal heads or claws; the handles are frequently trilobed. The most common material at this time was brass. There are outstanding 15th-century examples in the Louvre. Precious metals were also used, and a silver bucket has been preserved in the Museo dell'Opera del Duomo, Siena. During the Renaissance especially fine bronze pieces were made in Italy, among them the 16th-century Venetian one in the Museo Nazionale, Florence, and the one of jasper in the Louvre (VI, PL. 267). The baroque employed more complex forms and a greater variety of materials (including majolica), which were set in carved silver mounts. The traditional potbellied metal bucket, however, became the established type and is still in use.

n. Oil lamp and spirit lamp. Various kinds of lamps, suspended on chains or attached to the wall, have been used since early times during liturgical ceremonies. In the Early Christian period the most common type was the *polycandelon* — a large bronze disk, with several holes for glass oil dishes, that was suspended on chains. The British Museum preserves a noteworthy example dating from the late 6th century. In the Museo Archeologico in Florence are numerous 4th–5th-century lamps, for the most part of bronze, including clay oil lamps used in the catacombs; classic oil lamps with handles; box-shaped lamps with a single or double hinge, ornate handles, and several spouts; and more elaborate lamps in the form of a boat with figures of Christ and Moses. Other box-shaped lamps were held on supports very like candlesticks, with feet in the form of animals, a long stem with several knops, and a broad plate with a point in the middle. Their exact use, however, is not known. A

curious hemispherical lamp found at S. Martino ai Monti, Rome, may date from the 5th–6th century. Made of silver foil, perforated and with braided decoration, and with holes for suspension chains, it was designed to hold a glass oil vessel. In the Romanesque period the extensive use of metal lamps in the form of vases, amphoras, crowns, and other objects is documented by depictions in frescoes and miniatures, as well as by actual examples that have survived, including a fine 11th-century work in gilded silver and glass in the Treasury of S. Marco, Venice. This collection also contains numerous contemporaneous Byzantine examples in glass and crystal. The unique pieces in the Cathedral of Aachen and in the Church of St. Maurice, Coburg, were inspired by the imaginary architecture of the Heavenly Jerusalem and depict a wall with gates and towers; they may date from the 12th century. The lead lamp in S. Maria Maggiore, Barletta, has the form of a plate with holes and is adorned with palmettes. It derives from the *polycandelon* type, which continued to be used in the Byzantine Church. In the Gothic period suspended lamps were made of finer materials and were more elaborately decorated. The Treasury of S. Marco preserves 13th–14th-century works in glass, alabaster, and ivory set in silver mounts with precious stones, as well as a fine collection of 15th-century Venetian lamps in blown glass and openwork brass. Renaissance lamps, almost always of bronze, were created in a variety of forms. There are examples by excellent artists in the Museo Nazionale in Florence and in S. Marco, Venice. In the 16th century oil and spirit lamps began to be replaced by more efficient chandeliers with several lights. The so-called "chandelier of Galileo" in the Cathedral of Pisa is famous. In modern times lamps continue to be used, although much less extensively because of modern lighting techniques. By specific liturgical requirement, suspended lamps of traditional form continue to burn votive oil in front of altars of the Holy Sacrament. Modern works include the lamp of gold and precious stones by Pio Castellani (1870), in the Treasury of St. Peter's, and the one by Alberto Gerardi (1935) in the Church of Gethsemane in Jerusalem.

o. Flabellum. Another instrument that early entered liturgical use is the flabellum, or fan, a disk on a long handle that was used in order to keep flies away from the Eucharist. The earliest extant examples date from the 9th century, but the flabellum was certainly used earlier. Greek-rite flabella, known as "rhipidions," are all metal, silver for the most part, and cherubim heads are engraved on the disk. The two flabella (12th–13th cent.) in the Cathedral of Seres (Macedonia) were even enhanced with enamels. Metal flabella were also used in the West, for example, those in the Cathedral of Hildesheim, in Angers, and at Kremsmünster. Often the disk was replaced by a piece of silk or linen, by parchment, or, more frequently, by feathers. At the same time carved bone or ivory came to be used for the handle in place of gilded silver. One of the most important ivory-handled examples is the flabellum of Tournus (PL. 174). By the end of the 14th century flabella had nearly gone out of use; in modern times they are used only in pontifical Masses in the Greek and Armenian rites and are of symbolic significance. The modern flabellum consists of a fan of two rows of ostrich and peacock feathers on a long handle covered with crimson velvet and adorned with a gold band.

p. Lectern. In Early Christian times the function of the lectern was served by an inclined slab set on the ambo. In the Romanesque period the function was performed by a support in the shape of the symbolic eagle, incorporated into the pulpit. There was no lectern on the altar, the text being placed directly on the altar. The lectern as a distinct object was adopted only later for common reading and prayer in the monasteries and there formed part of the wooden choir. There were also metal lecterns (iron, bronze) with bases similar to those used for monumental candlesticks. This type of lectern was the specialty of the workshops of Dinant from the late 14th century on; there are examples in many French and German cathedrals. In the Gothic period works of outstanding beauty were created in carved wood, with elegant intarsia, such as those in S. Orso in Aosta and in the Pinacoteca Nazionale in Lucca. In Italy 15th-century lecterns often took on architectural forms, as in the one designed by Baccio d'Agnolo for S. Pietro in Perugia. Renaissance lecterns are more complex in design and decoration (PL. 170); this trend was, of course, more pronounced in the baroque period. In addition to the monumental lecterns in the choir, lighter but no less elaborate ones were also used, for example, the 17th-century one in the Museo Nazionale di Antichità, Parma. In later centuries the large immovable lectern became less common, in part because of the smaller dimensions of later choir books and liturgical texts. More common was the altar lectern, a simpler structure of carved and gilded wood which is still used.

q. Faldistory. The faldistory, or faldstool (from Old High German, *faldstuol*), is a folding chair of metal, wood, or ivory, used as the seat of a bishop within the chancel. The folding chair itself is derived from Roman types known chiefly through reliefs and coins. Notable faldistories include the six examples discovered in the necropolis of Nocera Umbra, as well as the so-called "Throne of Dagobert" (III, PL. 68), and the *sella plicatilis* discovered in Pavia and dated to the 8th–9th century. When the position of the altar was finally established against the rear wall, with the episcopal throne flanking the altar, the faldistory was abandoned. Today it is used only in certain churches for the reading of the litany.

Vestments and sacerdotal insignia. This section will be limited to a short catalogue of the most important liturgical garments and insignia; for further discussion see COSTUME (especially FIG. 45) and EMBLEMS AND INSIGNIA.

a. Alb. The alb is one of the oldest and most traditional liturgical garments. It is a long white linen tunic with long sleeves and derives from the Roman *tunica talaris*, which was especially popular in the eastern provinces. The only changes it has undergone through the years are those in the decoration and some minor variations in the cut. During the Early Christian period it was undecorated. Later it was adorned with bands and rectangles of colored or embroidered cloth called "apparels." At first these were dyed a solid color, most often purple, and consisted of vertical strips called "clavi," one over each shoulder reaching nearly to the hem, as well as edging of gold and silk embroidery at the neck, wrists, and hem. The edging later took the form of rectangular patches. At the same time the body of the alb became fuller (IV, PL. 10). In the 16th century there was a reaction against the colorful embroidery, and it was replaced by white lace. A colored ground matching the vestments of the celebrant is now permitted beneath the appliquéd lace.

b. Surplice. The surplice, a later transformation of the alb, is a white linen or cotton gown, shorter and more ample than the alb, with long wide sleeves. It is worn not only by priests but also by attendants at the Mass. It seems to have been introduced during the 11th century in England, France, and Spain, and later spread to the rest of Europe. During the 16th century it was given ruffles and tucks, and in the 17th lace edging and embroideries were added.

c. Rochet. The rochet is another variation of the alb and differs from the surplice in that it has narrow sleeves. A long unornamented rochet, documented since the 11th century, was worn by all medieval prelates and clerics. During the Renaissance lace was added at the neck and wrists; from that time only the higher clergy were permitted to wear it. It was worn under the mozzetta, a short, hooded cape.

d. Dalmatic. The dalmatic derives from a garment of the same name adopted by Roman patricians during the late-antique period. In the 3d century it became the daily habit of bishops. It was then a loose garment, reaching just below the knee, and

had wide sleeves; it also had clavi and bands around the sleeves. When it became a vestment, it was worn by all the clergy, and the clavi and bands were woven in with purple thread. During the early Middle Ages the dalmatic was almost always white, as may be seen in the paintings and mosaics of the period (Ravenna; Milan, S. Maria presso S. Satiro). By the 10th century colored cloth was used in many countries, though in Italy white prevailed. During the Romanesque period the dalmatic became more ample, flaring below the arms, and by the 14th century the sleeves were often wider at the wrist than at the shoulder. At the same time more valuable textiles, rich colors, and embroidery were used (IV, PL. 10). In the late 12th century, when the canonical colors were established, the dalmatic began to be dyed to match the other vestments. The most important Renaissance change was the enlargement of the neck opening and the addition of two tasseled cords to close it. Since then the dalmatic has changed little.

e. Tunicle. The tunicle is a liturgical overgarment derived from the ancient tunic and is similar to the dalmatic but narrower and with longer sleeves. As a liturgical vestment it was distinctive of subdeacons in Rome in the 6th century. Although abolished by Pope Gregory the Great, it was reintroduced in the 8th century to be worn under the chasuble by bishops and the Pope, but it again went out of use at the end of the Middle Ages.

f. Girdle. The girdle is a later version of the belt worn with the ancient tunic and has been used to belt sacerdotal tunics since Early Christian times. Because it was part of the vestments and had been established in the liturgy as a symbol of chastity, it became a precious ornament during the Middle Ages. Usually it was a long silk band studded with gold and gems or richly embroidered. Now it is thought of only as a functional object and is usually merely a cord with tassels at the ends.

g. Amice. The amice is a rectangular piece of white linen worn over the alb, around the neck and shoulders. It is kept in place by two cords passed under the arms, crossed in back, and tied in front. Its origins are not clear, but it has belonged to the liturgical vestments since the end of the 8th century. It is worn during some rites, and in the 13th–16th centuries it also served as a hood. Its border was often richly embroidered and even enhanced with gold and gems, as in the two embroideries, embossed and covered with seed pearls, preserved in the Church of St. Mary, Gdańsk. Although it has not lost its double function, it is now given its simpler early form.

h. Chasuble. The chasuble is an outer garment, a full, calf-length cloak derived from the ancient paenula. It was included among the liturgical vestments in the 5th or 6th century, as may be seen from the mosaics in Ravenna and in S. Agnese, Rome, and from the frescoes in the Catacombs of S. Pancrazio, Rome. From the 12th century on, the officiating priest wore a chasuble. Romanesque chasubles were usually of fine stuffs of solid color with an allover design. Richly embroidered examples from this period have survived, for instance, those in the Treasury of the Cathedral of Bamberg — one of the 11th century with figures in medallions, another depicting the stars and constellations — as well as a later one known as the "Hungarian coronation mantle."

The cut of the chasuble gradually changed. The early type, generally referred to as the "bell chasuble," was made from a semicircular piece of cloth. After the 13th century it became narrower and was open at the sides, giving the arms greater freedom. Finally, it was so narrow at the shoulders that this type came to be called a "fiddleback chasuble." Many different kinds of cloth were used — wool, linen, cotton, silk — and the designs were as varied, the more common being geometric, floral, and even animal motifs (the last introduced from the East). From the 11th century on, the chasuble was decorated with the orphrey, a broad vertical band divided into two or three branches at the top, suggesting a cross. The orphrey is usually richly embroidered, often with religious scenes and with gold and silver threads and even pearls and gems. The present-day chasuble is usually of embroidered silk, and its background color is determined by the colors assigned to the feasts and by the Ordinary of the Mass. Outstanding medieval and Renaissance chasubles are in the church at Sankt Paul im Lavanttal in Carinthia; in the Cathedrals of Erfurt, Halberstadt, Fermo, and Pistoia; in the Cathedral Treasury of Anagni; in St. Mary's, Gdańsk; in the Museo dell'Opera del Duomo, Siena; and in S. Maria in Vallicella, Rome.

i. Cope. The cope is an ample cloak of semicircular shape that is usually richly adorned, often with motifs or figures repeated in an allover pattern. It is known to have been used as a liturgical vestment by the 10th century. Originally it differed from the standard bell chasuble only in that it was open in front and had a hood. There have been almost no changes in its cut. The only alteration was in the hood, which lost its function after the 12th century and, during the 14th and 15th, became a flat ornamental panel; at first this panel was triangular, but later it was shaped like a heraldic shield, usually edged with a gold fringe, and bore a tassel at the bottom. There are outstanding examples in the Victoria and Albert Museum, London; Sankt Paul im Lavanttal, Carinthia; the Schatzkammer, Vienna; and the Museo Civico, Bologna. The cope was closed at the neck by a brooch. During the late Middle Ages and the Renaissance such brooches were often very large and ornate examples of the finest goldsmithery. Frequently religious scenes were illustrated on them, as in a Gothic example with the Annunciation, in the Cathedral in Aachen. Others had only a single figure, often a saint, or heraldic motifs. During the 13th century another sort of fastening was devised for the cope. This was the morse, an embroidered rectangle that was sewn to one side of the cope and fastened to the other.

j. Maniple. The maniple is an embroidered band of cloth which derives from the Roman *mappa*, or *mappula*, a cloth that served as a napkin and as an insigne of office for consuls and other officials. It is recorded as a liturgical item in the early Middle Ages, but neither its form nor its function is certain. During the 8th and 9th centuries the maniple was a folded cloth, but by about A.D. 1000 it was a decorative band. In both cases it was hung over the left forearm, as it is still.

k. Stole. The stole is a long decorated band worn by deacons, priests, and bishops since the 10th century. It is draped across one or both shoulders and sometimes crossed over in front, depending on usage and the rank of the wearer. Little is known about its origins except that it seems to have been worn by the lesser clergy in the East as early as the 4th century. There have been no changes in its form. Medieval and Renaissance stoles are often richly embroidered.

l. Pallium. The pallium is a long band of white wool, worn by popes and archbishops since the 15th century as a circular piece with pendants in front and back. It has been part of the liturgical vestments since the 5th century. It probably derives from the ancient Roman *pallium*, and early mosaics and frescoes show that it was a loose band worn draped over the shoulder, with one loose end hanging down the front and the other down the back.

m. Succinctorium. The succinctorium is similar to the maniple and is worn attached to the girdle on the left side. It is an insigne of the higher clergy, beginning with bishops. Although it is recorded in Rome and Ravenna in the 8th and 9th centuries, little is known about its medieval forms and usage. In modern times it usually has a Lamb of God embroidered in gold at one end and a cross at the other.

n. Fanon. This term is sometimes used for the maniple, but it may also designate a short cape or deep collar covering the shoulders, worn as a papal garment. In use by the 13th century, it has changed little since then.

o. Rational. The rational is a medieval liturgical vestment for bishops. Cut in any of several different ways, all derived from the pallium, it can be Y-shaped, circular (like a large collar), or H-shaped, with or without pendant elements. It almost always has richly embroidered scenes and inscriptions and often is adorned with gems, pearls, small plaques, or brooches. The term "rational" is also used for the large metal plaque hung from a chain around the neck or attached over the chest with a brooch. Neither type was used after the Middle Ages.

p. Miter. The most important liturgical headgear is the miter (PL. 174). Though it came into use comparatively early, its origins are uncertain. It underwent various changes in form, beginning with an almost perfect cone. In the 11th century the crown was often rounded, and later it was frequently indented in the middle. At this time two streamers were added in back. During the Middle Ages this type of miter came to be worn sideways, a practice that became established. During the 16th century the two pointed sides, thereafter separated into front and back panels, took the form of a pointed arch. The miter now worn by bishops, cardinals, and the pope is made of two stiff boards of this shape joined by a cloth so as to form a bellows, and streamers are attached. Through the 16th century the decoration usually consisted of embroidered ornamental bands, figures, and gems. In contrast, the miter used in the Eastern rite has a single bulbous crown and is surmounted by a cross.

q. Tiara. The tiara, the papal diadem or apostolic crown, developed from the miter. Its early form was conical, and an 8th-century description mentions that it was usually white and shaped like a candle snuffer. About the 10th century it was given a broad vertical rim band that symbolized papal authority. Boniface VIII (1294–1303) added a second crown; thus one signified the pope's temporal power and the other his spiritual power. Early in the 14th century either Benedict XI (1303–04) or Clement V (1305–14) added a third; it was then called the "triregnum" and symbolized both the Trinity and the pope's triple jurisdiction as the Vicar of Christ. The circlets are of gold and very like actual crowns. The earlier tiaras were more rounded and usually surmounted by a small cross; those produced since the 16th century have changed little.

r. Crosier. The crosier, or pastoral staff, is a tall staff with a crooked head. It is a liturgical insigne reserved for bishops and mitered abbots. Its origin is unclear, but it seems to derive, at least symbolically, from the staff of the Hebrew shepherds rather than from that of augurs or from the staff used in the investiture of Byzantine officials. Early crosiers were simple wooden staves terminating in a knop, a cross, a crook, or a tau. The early Celtic staves, most of which belonged to saints and were therefore preserved, were very plain, but as objects of veneration they were later encased in elaborately worked gold, silver, or bronze plates, often set with gems (e.g., crosier of Kells, Br. Mus.). In the 11th century the crosier was given a handle terminating in a volute. One of the earliest examples of this type of handle is the staff of St. Erhard in the Louvre. Gothic crosiers show great variety and inventiveness in the designs of the heads. Precious metals (PL. 174), enamels, ivory, or carved, gilded, and painted wood were used. Decorative motifs, animal figures, and even whole scenes appeared on them, as in the many fine crosiers made in Limoges in the 13th century. In these the knop is round and often pierced; in many other Gothic staves, however, the knop takes the form of a Gothic *tempietto*, as in the silver-gilt and enamel staff that belonged to William of Wykeham, Bishop of Winchester (1367–1404), in Oxford, New College. In the 15th and 16th centuries relief replaced polychrome decoration. The volute again underwent a rich development in the baroque period, but subsequently there was greater simplicity in its form and ornament.

Francesco NEGRI ARNOLDI

JEWISH CEREMONIAL ART. Documentation of Jewish ceremonial art begins with the Old Testament. The Israelites carried about with them in their wanderings the Ark of the Covenant, a coffer plated with gold and surmounted by the figures of two cherubim, and the craftsman Bezaleel, who with Aholiab was responsible for the construction of the Tabernacle in the wilderness, is mentioned in terms of high respect. Later the Ark of the Covenant was placed in Solomon's Temple, where it was guarded by two winged cherubs carved in olivewood and gilded; we have descriptions, too, supported by archaeological parallels, of the altar, lamps, lavers, and other Temple appointments, and of the two gigantic freestanding columns with pomegranate (or pomegranate-and-lily) capitals before the porch of the Temple, which were to be a recurrent symbol in Jewish ceremonial art. Yet, owing to the singular history of the Jewish people — and perhaps also to the nature of its religious teachings (see JEWISH ART) — the oldest of the great living religions of the Western world can point to almost no surviving ritual objects that antedate post-medieval times.

The dispersion of the Jewish people throughout the world brought about radical changes in their ceremonial art, as it did in all phases of their lives, but because so few examples have come down to us, little is known about the nature of these changes. Only from the 16th century onward is there enough material extant to enable us to form a clear picture. The diversity of styles that emerges points up the unique linking of the Jews with the culture of the lands in which they live. In the ritual objects of Islamic provenance the styles of the ancient East are reflected, and abstract ornament prevails, as in Islamic art. Jewish ceremonial art of European provenance partakes, in the 17th century, of the splendor of the baroque style, in the 18th century of the delicacy of the rococo; the late-18th- and early-19th-century works conform to the formal neoclassic style, while works of the end of the 19th century reflect the prevailing artistic eclecticism. Today leading artists and craftsmen are interpreting the traditional Jewish symbols in new forms and materials, bringing contemporary design into ritual appartenances for home and synagogue.

The Torah scroll and its appurtenances. The Torah scroll contains the Pentateuch, the first five books of the Bible, inscribed by hand in accordance with elaborate regulations that have ensured consistency over the centuries. As the Torah is the most sacred possession of the Jew, the Torah scroll is the most sacred object in the synagogue. (The synagogue generally has several scrolls.) The use of the parchment scroll — forerunner of the book — which was general in antiquity, has been maintained to this day, but the Torah scroll is an unusual variant of the ancient form, being wound around two handles rather than one; the tradition of the double scroll for the Torah goes back at least as far as the time of the Second Temple.

The Torah scrolls are kept in the Torah shrine, or Ark (*aron kodesh*, Ark of the Law). The Ark, consisting of a movable wooden structure, was probably an important element of the synagogue by the 2d or 3d century of the present era. Synagogues of the 4th and 5th centuries in Palestine in many cases have apses in which the shrine was placed. By the 4th century, stone shrines and wall niches also often served to house the Torah scrolls (VIII, PL. 333). How the Torah shrines of the Talmudic period appeared can be learned from representations on late-antique mosaic pavements of synagogues from the 5th to the 8th century, as well as on gold glasses and on other examples of the minor arts. Most of these seem to be wooden structures closely resembling the Roman armarium (cupboard), which also served as a bookcase, as can be seen from various Roman reliefs and paintings. Thus the Ark usually has two doors, a low base, often with feet, and a gabled top. In many examples there are two columns with pomegranate capitals suggesting the two columns before the Temple. The Ark shown in the mosaic in the Beth Alpha Synagogue is an especially richly decorated example (VIII, FIG. 915). Of particular interest is the rare representation on a gold glass in the Vatican Museums in which the doors are open to show the shelves crammed with scrolls.

In Europe during the Middle Ages, the Ark, following contemporaneous secular styles, came to look like a fairly large

and elaborate two-tiered cupboard (see FURNITURE). A beautiful Gothic example from Modena dated 1505 is in the collection of Musée de Cluny, Paris. With the Renaissance, forms became larger, more architectonic, and imposing, adopting the columns, pediments, carefully profiled moldings, and monumental balance of proportions of contemporary furniture. One of the most famous Torah shrines is the Ark of the Portuguese Synagogue in Amsterdam (1675). By this time the Ark, which had been somewhat eclipsed during the Middle Ages by the large bema (reading platform) in the center of the synagogue, had again become the focal point. In eastern Europe the emphasis was on richer and more colorful decoration rather than on the architectural aspects, and in some of the smaller, wooden synagogues of Poland and Russia this type of work reflected the finest traditions of folk art.

In the lands under Islamic domination, too, the Ark was usually a two-doored wooden structure; forms were influenced by Eastern designs, and Hebrew inscriptions served as decorative elements in much the same way as did Arabic calligraphy in the mosques.

The desire to render beautiful the setting and the ceremonial objects for the service of God, which applied with particular force to the Torah, extended to its various appurtenances, and upon these as well the utmost artistry and the finest materials were lavished. The visible parts of Torah handles, or rollers, when made of wood were often elaborately carved or turned or richly inlaid with ivory or mother of pearl; some were entirely made of ivory.

The Torah scroll is protected by a mantle of fine fabric or a case. The form of the case, dictated by that of the scrolls, is either cylindrical or octagonal, and both wood and metal are used. Most of the cases are of finely worked silver, usually embossed or chased, but some are of other metals, as is the copper one inlaid with silver made by one Master Joseph in Damascus in 1565 (New York, Jewish Mus.). In Persian and other Eastern Jewish communities the case was usually of wood, sometimes embossed with metal, and the Torah scrolls could not be removed from it (examples in the Bezalel Nat. Mus., Jerusalem).

The embellishments of the Torah traditionally include ornaments placed over the upper ends of the handles — either a crown (*keter*) or a pair of finials (*rimmonim*), in a few cases both (VIII, PL. 338). Custom varied in different periods and in different regions. The symbolism of the Torah crown is based on the Rabbinic metaphor referring to the "Crown of the Law." The term *rimmonim* (pomegranates) arises from the fact that in the East an early form was modeled on this fruit, a motif with antecedents going back to the two columns before the Temple of Solomon. Many other forms, some of them architectural (the steeple, the turret), appear, most of them greatly elaborated. Silver and silver-gilt were the metals chiefly used. The earliest examples of finials with small bells (which became a universal feature) are Sicilian, of the 14th or 15th century (Treasury of the Cathedral of Palma, Mallorca).

The so-called "breastplate," another adornment of the Torah scroll, is an essentially rectangular plaque, originally with an interchangeable, central panel bearing an inscription indicating the Sabbath or holiday on which a particular Torah scroll was to be used. Around the inscription there was ample space for a wealth of decoration, and finally the utilitarian function disappeared and only the decorative element remained. This ritual object, too, reflects contemporaneous influence, lending itself particularly to the more delicate chasing of the rococo style. As the name implies, the breastplate took on a symbolical relation to the breastplate of the Biblical high priest, and two of the more common ornamental motifs have a religious significance: two columns, again alluding to the two columns standing before King Solomon's Temple, and the lions, symbolizing the Lion of Judah. How early and how extensively the breastplate was used is not certain.

The pointer used by the reader of the Torah to follow the text, to spare it from being touched by the hand, was traditionally fashioned with the same care as the other appurtenances of the Torah. Innumerable examples have survived from the 18th and 19th centuries, none earlier than the 16th. Silver was the popular material; gold, carved bone, and semiprecious and precious stones were also used. Elaborate designs, with decorations of inlay and filigree work, are common. As a rule the pointer terminates in a miniature hand with the index finger extended; from this feature derives its designation, *yad* (hand).

The artistic workmanship of the gold and silver ritual objects is equaled by the splendor of the textiles used in connection with the Torah. These serve various functions: A fine cover is placed on the table on which the Torah scroll is unrolled to be read. The wrapper, a long, narrow strip of cloth, is used to bind it together when not in use. The mantle that covers the Torah scroll when it is not in use has already been mentioned. A curtain of richly ornamented material (*paroket*) is hung before the Ark. It is known that the artistic development of these textiles was considerable during the European Middle Ages, though few examples have been preserved that antedate the end of the 16th century. One of the earliest examples is not a European piece; it is the Torah curtain dated 1509 in the Samaritan Synagogue in Nablus (anc. Shechem), Jordan. The finest materials — linens, silks, brocades, and velvets — are used; they are richly embroidered in allover patterns and with inscriptions in silk, gold, and silver threads. Much use is made of appliqué. In areas such as Czechoslovakia, where the local textile industry could not supply suitably sumptuous work, fine textiles were imported from Italy, Spain, and elsewhere. These Jewish ceremonial textiles reflect the best in contemporaneous production (see TEXTILES), being distinguished from others only by their ornate Hebrew inscriptions and motifs. The inscriptions are of great historical significance, since they often provide such information as the name of the donor, the place of origin, and the date. A fine example in New York (Jewish Mus.) is dated 1681 and was made in Italy; it is of purple silk, worked with gold and silver appliqué and embroidery. It shows the tablets of the Law appearing at Mount Sinai and the walled city of Jerusalem with the Temple and its Holy of Holies.

One of the richest collections of ceremonial textiles is in the Jewish Museum in Prague, where some 10,000 pieces from Moravian and Bohemian synagogues that have suffered destruction or desertion have been assembled. The importance attached to the Torah curtain can be gathered from the fact that the Pinkas Synagogue in Prague had so many beautiful examples that before World War II a different one was hung up every day of the year.

Lamps. Lights and the act of lighting have an important place in Jewish ritual, whether in the synagogue or in the home: As the Tabernacle in the wilderness had a perpetual fire burning upon the altar, so an everlasting light (*ner tamid*) is suspended before the Ark in the synagogue; the celebration of the Sabbath is inaugurated and closed by the kindling of lights; and the eight days of Hanukkah, or the Feast of Lights, are marked by the successive lighting of the lamps of the eight-branched candlestick — to cite a few examples. The description in Exodus of the seven-branched golden candlestick made for the Tabernacle is believed to apply to the menorah in the Second Temple (built by Herod and sacked by the Romans A.D. 70, after the fall of Jerusalem); this may have been the one depicted in the relief on the Arch of Titus (PL. 161), where the conquerors are carrying it in the triumphal procession. After the destruction of the Temple it was forbidden to make seven-branched candlesticks for use, and no freestanding ones from ancient times have been found. As a symbol the menorah is, of course, one of the recurrent decorative motifs in Jewish ceremonial art.

From ancient times up to the 8th century, oil was used for the Sabbath lights. The hanging Sabbath oil lamp of the Middle Ages is familiar to us from illuminated manuscripts. It had a rich and complex development, incorporating all the diverse metalworking techniques and the regional styles of the Diaspora lands, but the basic form remained comparatively consistent. The oil was contained in a star-shaped bowl with projecting points that served as spouts for the wicks. Frequently

there were six points, as in the Star of David, and below the main bowl was a smaller one to catch drippings; the upper part was often made up of a series of knops or of a towerlike structure such as is seen in the 17th-century silver lamp from Frankfurt am Main in New York (Lehman Memorial Coll., Temple Emanu-El). In the 17th century the Sephardic Jews in London and Amsterdam developed a characteristic variant with blunt spouts. Many examples are in silver, some of the finest pieces being attributable to well-known silversmiths; Sabbath lamps were also made in brass and in glass. The Jewish Museum of London contains an example in glass dating from 1694 that looks like a typical mosque lamp except for the Hebrew inscription. In the Near East, as elsewhere, few early works have survived, although in late-antique and early medieval times the Jews were renowned in these parts for their glass and metalwork. During the last two centuries, as candles have replaced oil, lamps have given way to candlesticks.

The Hanukkah lamp, lighted during the holiday commemorating the rededication of the Temple by the Maccabees after their victory over the Syrians in 165 B.C., has two typical forms. The older is the "bench" type, with the eight lights in a row at the bottom and the "servant light" (*shammash*) at the top of the solid back piece. Originally the lamps were, like the Roman oil lamps, of clay; there are also examples in stone and in pottery. During the Middle Ages, when Hanukkah lamps began to be lighted in the synagogue and lamps on a larger scale were in order, the menorah type of lamp was developed, following the description in Exodus and the representations in illuminated manuscripts; smaller versions of the type were created for home use. Metal became the rule — brass, bronze, pewter, and later silver. A few Gothic pieces are extant: a 14th-century Italian lamp in New York (Lehman Memorial Coll., Temple Emanu-El) and a 14th-century French or Italian one in Toronto (private coll.).

Other Sabbath and festival ritual objects. The ceremony proclaiming the holiness of the Sabbath or holiday (kiddush, or sanctification), is recited over a cup of wine before the evening meal. A favorite material for the kiddush cup (which is required to be without flaw) is silver, but other metals are used, and glass as well. These goblets are worked in infinite variety; some of the most striking examples are made for particular festivals, such as Passover. Perhaps the most interesting of the many examples in the Jewish Museum in New York is a gold kiddush cup from Frankfurt am Main dated about 1600. Hebrew inscriptions are entwined among vases with flowers and three cartouches with animals (lion, stag, and unicorn).

In the ceremony concluding the Sabbath (*habdalah*, or "separation," i.e., of the holy day from the other days of the week), a special braided candle is lighted and aromatic herbs and spices are used to symbolize the sweetness of the day. Containers to hold these aromatics have been, over the centuries, a particular challenge to the ingenuity and skill of craftsmen. The majority of the containers are of metal, most often silver, but other materials have been used. One of the most popular forms, both in Europe and in the Near East is the miniature tower: the earliest surviving ones obviously imitate medieval steeples, sometimes being adorned with clocks, small figures, and bells or pennants; in eastern Europe the container often was given the form of a fruit or flower on a curved stem.

Numerous other ceremonial appointments have been and are being produced with that degree of creativity and imagination which places them in the category of art objects; among these are the plate to hold the symbolic foods for the Passover Seder and the cup for Elijah used at the same service, the ram's horn (shofar) blown in the synagogue on the high holy days, the *greger* (noisemaker to anathematize Haman) used in the Purim service, and the box to hold the ethrog (citron) during the celebration of Sukkoth. Cases for the phylacteries (*tefillin*) used in daily prayer and the mezuzah attached to the doorpost of the house are still other characteristic objects that should not be omitted from even a summary treatment of Jewish ceremonial art.

LOCHNER (LOECHENER, LOCHENER, formerly misread LOETHENER), STEFAN. German painter, born at Meersburg on Lake Constance, not earlier than 1410–15, the son of Georg and Alhet Lochner. After his apprenticeship he doubtless went as a journeyman to the Low Countries, where he must have completed his training in the 1430s in the workshop of Robert Campin (the presumed Master of Flémalle) and perhaps been influenced by the art of Jan van Eyck. His stay in Cologne is documented from 1442 to 1451. In June, 1442, he received an order for decorations from the city council, and in October he acquired a house together with his wife Lisbeth. He is mentioned in notes of indebtedness of October, 1444, and September, 1448. In 1447 and 1450 he was elected to the council. He died, probably of the plague, between Sept. 22, 1451, and Jan. 7, 1452.

A notice by Dürer of October, 1520, in the journal of his travels in the Netherlands, informs us that Lochner was the author of the most important panel painting ever executed in Cologne: the *Altar of the Patron Saints* (PL. 179), showing the patrons of the city — the Virgin, the Three Kings, St. Gereon, and St. Ursula. Painted in the 1440s for the Town Hall Chapel that was destroyed in 1945, it has been in the Cathedral since 1810.

This work is not dated, but there are two paintings, both Presentations in the Temple, which are: one in Lisbon (Gulbenkian Foundation), of 1445 (the "5," however, is questioned), the other in Darmstadt (PL. 180), of 1447. The prayer book in the Landesbibliothek of Darmstadt, with illustrations ascribed to Lochner, must be of 1450. Paintings or illuminations can be attributed to him solely on the basis of stylistic comparison with his main work, identified by Dürer.

The oldest preserved painting — to judge from the treatment of space, which relates it to the miniatures of the 1420s and the 1430s, and from the unmistakable dependence on Campin — is the *St. Jerome in His Cell* (coll. of the heirs of Edith von Schröder). The archaic formulas still employed by Lochner set forth in effective contrast the lively conception of details and the very personal, soft, and pleasing treatment of surfaces.

Shortly after 1440, probably, Lochner painted *The Last Judgment* (central panel, Wallraf-Richartz-Mus., PL. 180; inner sides of wings, Frankfort on the Main, Städelsches Kunstinst.; outer sides, Munich, Alte Pin., PL. 182). The inner face presents the resurrection of the dead, the Last Judgment, the portal of heaven, hell, and, on the wings, the martyrdom of saints. A meaningful proportion and a pulsing rhythm relate the three large figures of Christ, the Virgin, and John the Baptist to the swelling mass of little people beneath them. By far the greatest portion of the total area is devoted to the deeds and destinies of the wicked. Wedged between them is the small band of the elect entering the narrow gate of heaven, their backs turned to the world. The details of the demonic scenes are in no way inferior in dramatic power to those of Bosch and Bruegel. All the more striking is the soft and radiant beauty of the painting, masterly in its maturity, which lends a captivating glow to skin, hair, garments, and angels' wings. The tension expressed in the contrasts between godliness and ungodliness, calm and turmoil, reflects the trends of thought that followed in the wake of the great German and Netherlandish mystics of the 14th century; it is manifested even more clearly in many details, such as the variously repeated motif of angel and devil struggling for a soul. The outsides of the wings display six tranquil figures of saints wrapped in pure and gentle majesty (PL. 182).

The *Altar of the Patron Saints* (PL. 179) deals with the homage to the Christ child by the city of Cologne — represented not by its terrestrial, temporal dignitaries but by its eternal guardians and mediators. The subject is not the usual episode of the Adoration in the stable but an event of the highest solemnity unfolding in eternity and mirrored in time and space. The kings with their resplendent following who occupy the central panel are joined, on the wings, by the martyrs who, centuries later, gave their lives on the soil of Cologne. On the right is Gereon (the second head to his left may be a self-portrait of the painter); on the left is Ursula with her maidens, her betrothed Aetherius, and the princes of the church who accompany her. The distribution of the masses and the slightly billowing movement are of incomparable artistry. The figures on the wings, closer to the picture edge than those of the central panel, look as if they sought to form a circle around the Child, a circle that could incorporate the small group of city councilors who, before each session, heard Mass at the foot of the altar. In the Christ child the bloom

of infancy accompanies a restrained gesture of conscious dominance that makes this figure the focal point of the composition. The color scheme is based on the elementary triad of red, green, and blue (fire, water, and air) over the grayish-brown of the earth and against the gold of the *quinta essentia* in the background. Each of these colors reappears in the richest nuances over the entire surface; in the central group the red of the oldest king, the green of the middle one, and the ultramarine of the Virgin unite the utmost intensity with an unearthly softness.

The outsides of the wings show the Annunciation (PL. 179), whose ordinary setting, a Cologne interior, presents a deliberate contrast to the nobility of the figures — an illustration of the teaching that anywhere, at any moment, God may enter into the soul of the believer.

Probably a little earlier is the *Virgin with the Violet* (Cologne, Erzbischöflisches Diözesan-Mus.). Although exact specifications seem to have been imposed by the donor, the painter's imagination, kindled by mystic love, was powerful enough to make a personal hymn of this work, which stands alone in its time.

From an altarpiece dedicated to the Virgin and apparently completed in 1445 are preserved the *Presentation in the Temple* (Lisbon, Gulbenkian Foundation) and the *Adoration of the Child* (Munich, Alte Pin., on loan), in which a chatty, almost genrelike quality combines with a gentle grace.

The versatility of Lochner's genius and the rapid development of his artistic capacities are demonstrated in the *Presentation in the Temple* of Darmstadt (PL. 180), by the highly personal manner in which he has mastered the dynamics of depth. In Mary he presents the perfect lady of society, surrounded by figures full of life, yet transfigured as by an unearthly light. In the treatment of colors, especially the ultramarine, few paintings of the century approach this one.

The Virgin in the Rose Bower (PL. 181), in which the still, otherworldly figures are larger in scale than their symmetrically balanced surroundings, must have been painted shortly before the artist's death.

In the realm of painting, the mystic movement fundamental to an understanding of German spiritual life in the late Middle Ages found in Lochner its most distinguished exponent before Grünewald. His art was completely personal and had no continuation. Only for a short time, and in the works of insignificant local painters, can traces of his manner be recognized.

LONGHENA, BALDASSARE. Major Venetian architect of the baroque period (b. Venice, 1598; d. Feb. 18, 1682). Longhena was a pupil of Vincenzo Scamozzi (q.v.), whose Procuratie Nuove (VIII, PL. 214) in the Piazza di S. Marco he helped to complete, and was influenced by Palladio, Sansovino, and Sanmicheli. Much of his work combines baroque richness of surface with the simple massing favored by these Renaissance masters, so that Longhena's effects differ fundamentally from the complexity of his Roman contemporaries Bernini and Borromini. His dependence on Scamozzi is evident in the earliest building attributable to him, the Palazzo Giustinian-Lolin (ca. 1623).

In 1631 Longhena received the commission for his masterpiece, S. Maria della Salute (II, PL. 141), on the Grand Canal. The church, substantially completed about 1648 but not consecrated until 1687, is basically an octagon with a great dome over it, to which are added a choir and sanctuary; the choir has its own, smaller dome, flanked by twin campaniles, and the plan is further complicated by apsidal transepts on either side of the choir. Calling to mind S. Marco, the array of two domes and two towers is splendid and typically Venetian; and the picturesqueness is enhanced by the huge volutes buttressing the larger dome, which have continued to delight painters from Canaletto and Guardi to Sickert and Kokoschka (I, PL. 410). The synthesis of varied elements and the potential of the setting at the edge of the Grand Canal were fully realized and exploited by Longhena. By comparison austere, the interior interest lies in the complex vistas created by eight identical, cleverly disposed piers, surrounded with an ambulatory and chapels except for the entrance unit and, at the opposite end, the separate but related unit composed of the choir and retrochoir.

The same richness of surface combined with Renaissance simplicity of form is apparent in Longhena's two most important palaces, Ca' Pesaro and Ca' Rezzonico (VIII, PL. 226), both also situated on the Grand Canal. The Pesaro was under construction in 1663, and the Rezzonico in the same decade; both were completed by others in the 18th century. The design of both palaces — a rusticated ground floor and two upper floors with columns between the arched window openings — derives from the Venetian palace type established by Sansovino and Sanmicheli. The Venetian baroque of Longhena, with its scenographic integration of space and clear homage to Renaissance precursors, evidences a considered solution of architectural problems rather than mere striving for ornate and external effect.

Peter MURRAY

LONGHI, PIETRO AND ALESSANDRO. Venetian painters of the 18th century. Pietro gained eminence as a penetrating observer of contemporary society, and his son Alessandro as a portraitist.

SUMMARY. Pietro (col. 318). Alessandro (col. 321).

PIETRO. Pietro Longhi was born in Venice in 1702 and died there on May 8, 1785. His father was Alessandro Falca, a silver caster; the origin of the name Longhi is uncertain. According to the writings of Pietro Guarienti (1753) and to an anonymous author in the *Compendio de' pittori veneziani . . .* (1762), Pietro received his earliest instruction from his father, but while still a youth was placed in the school of Antonio Balestra, who "after keeping him with him for several years" advised him to join the studio of Giuseppe Maria Crespi in Bologna. On Sept. 28, 1732, probably after an artistically profitable Bolognese sojourn, he married Caterina Maria Rizzi in Venice. From 1737 to 1773 his name appears in the register of the *fraglia* (guild) of Venetian painters, and from 1740 he lived in the parish of S. Pantalon. On Feb. 13, 1756, he was selected by a committee, presided over by Giovanni Battista Tiepolo, to be among the first members of the Accademia of Venice, where he taught alternate years until 1780. In 1762, with Giovanni Piazzetta and Tiepolo, Pietro drew up the inventory for and estimated the worth of art objects in the Sagredo estate. In 1763 he directed an academy of drawing and printmaking, founded by the Pisani family at their palace in Campo S. Stefano for the education of Almorò Pisani; but the painter was relieved of this duty after the premature death of the young patrician in 1675.

The large canvas of *The Martyrdom of S. Pellegrino* (ca. 1730) in the parish church of San Pellegrino, near Bergamo, and the frescoes depicting *The Fall of the Giants* (Venice, Pal. Sagredo; on the ceiling and walls of the staircase, signed and dated 1734 but necessarily begun some years earlier) furnish evidence that the young Pietro Longhi painted in the "grand manner." Following in the footsteps of his mentor Balestra, Sebastiano Ricci, and Louis Dorigny, Longhi tried to enter into the great decorative tradition through use of the baroque rhetoric; his success in this genre was limited, however, and probably it is not to be regretted that other examples of his courtly style have disappeared. Among these are the following: *Adoration of the Magi* from S. Maria Mater Domini; *Miracle of the Loaves and Fishes*, *The Wedding at Cana*, and *Miracle of the Centurion* from the Scuola S. Pasquale Baylon; *St. John the Baptist* and two other small pictures from the church on Isola della Grazia (mentioned in 1733 by Antonio Maria Zanetti); the *Blessing of St. James* and *Coronation of the Virgin* from the Oratorio di S. Biagio in Verona. Longhi's inability to distinguish himself in the painting of expansive historical and religious subjects — recognized by his contemporaries — was evidently a failing never overcome, as suggested in two wan figures executed late in his career, those of St. Peter and St. Andrew in the Church of S. Pantalon (last chapel on right-hand side; probably painted ca. 1780, contemporary with those done by his son Alessandro).

A notable exception to Pietro's limitations in this style are the fresco decorations he executed within the replica of the Sanctuary of the Holy House of Loreto, added to S. Pantalon in 1744–45. In the fragmentary groups of Madonnas and saints there is a light and delicate touch (reminiscent of and little inferior to the portrait manner of Rosalba Carriera), a distillation of the freshness and poetic intimacy characteristic of his small scenes of Venetian life.

Pietro Longhi's abandonment of the grand manner in favor of a painstaking depiction of contemporary life was in keeping with the cultural climate then fostered by the ideas of the French Enlightenment. In Venice, as elsewhere at the beginning of the 18th century, an acceptance of social realities became current, in contrast with the grandiose pageants of the established cultural tradition. The first evidence of a change in Pietro's interests can be seen in a sheet of three studies (Venice, Mus. Correr) for *The Fall of the Giants*, in which the academic anonymity of the figure types does not agree with the sure delineation of specific details and features, both in objects and in persons. The determining factor in Longhi's change of artistic direction was his familiarity with the art of Crespi, and its wealth of human interest — a familiarity clearly reflected in some pastoral scenes (Rovigo, Mus. del Seminario Vescovile; Bassano, Mus. Civ.) and in other scenes of peasant life (Venice, Ca' Rezzonico and Gall. Querini Stampalia). The first securely dated intimate views of Venetian life — *The Concert* (1741; Venice, Accademia) and others stylistically similar that must have been contemporaneous or not much later in date, such as *The Dancing Master* (PL. 183), *The Toilette* and *The Tailor* (both, Venice, Accademia), *The Introduction* (Louvre), *The Pot Game* and *The Swoon* (both Washington, D.C., Nat. Gall.), *The Awakening* (1744) and *Blindman's Buff* (both Windsor, Royal Colls.) — all testify to a growing artistic maturity and indicate that Longhi was familiar with 17th-century Dutch and Flemish painting and that he knew contemporary genre painting, particularly that of France.

His attainments and rich background are even more evident in the drawings, which are exceptional in their subtle discernment and in the evocative power of his line. The most important group of Pietro's drawings, that in the Museo Correr of Venice, is related less to the Venetian graphic tradition than to examples by Watteau and Nicolas Lancret. It consists of complete compositions, studies of single figures, and details of human figures or objects (occasionally supplemented by notes on proportions and color relationships). Though intended mainly as preliminaries for pictorial construction, these drawings have an extraordinary poetic quality.

Longhi very likely joined in a widespread European current in which artists sought more immediate apprehension of reality, but his means of expression were truly original; indeed, as early as 1753, Guarienti had referred to "his new and personal manner." The refined aristocracy of Watteau, the crude objectivity of Giacomo Ceruti, or the bitter satiric edge of Hogarth — none serves as suitable analogy for the art of Longhi. His *œuvre* comprises an intimate chronicle that captures, with incomparable penetration and with a subtly ironic viewpoint, the low-key, almost bourgeois character of the 18th-century Venetian aristocracy — reflected in the somnolent atmosphere of the old palace interiors themselves, as much as in the festive air of worldly gatherings or in contacts with the life of the common people. Within the scenic arrangement of his pictures, "blocked in" like the action in a play, the life of the characters is depicted frankly and with a warm sympathy. Their expressiveness and charm are heightened by the bright but softly modulated palette, of a pastellike subtlety, that invests the meticulous drawing, and the whole is harmonized with exquisite sensibility in an equally subtle and vibrant chiaroscuro.

Longhi's fresh and varied interpretation of social milieu, which has been compared in intent and effects with the theater art of Carlo Goldoni (confirmed by the dramatist's published statements of his aims, as early as 1750), was at its most comprehensive during the decade in which he painted — to cite only the most conspicuous examples — *The Visit to the Lord* (1746), *The Meeting* (PL. 185), *The Visit*, and *The Letter* (all New York, Met. Mus.), *The Herbseller* (Warminster, Eng., Longleat House, Coll. Marquess of Bath), *The Tooth Puller* (IV, PL. 29), *The Painter in His Studio*, *Family Reunion*, *The Seamstress*, *The Errand of the Negro*, and *Rhinoceros* (1751; cf. PL. 185, a variant of this subject; last-named five all in Venice, Ca' Rezzonico), the portrait of the Sagredo family (ca. 1752; Venice, Gall. Querini Stampalia), and *Excursion on Horseback* (ca. 1755; Ca' Rezzonico).

After about 1755 there occurs still another change in the painting style of Pietro Longhi. His color range favors dense and warmer tones, attuned to the soft chiaroscuro, while his draftsmanship becomes more free and cursive. The artist's outlook remains essentially unchanged, but it seems enriched by more varied and probing examination of his milieu. The *Sacraments* (Venice, Gall. Querini Stampalia) are incomparable vignettes of everyday religious life in 18th-century Venice, done with a lively wit and inspired, at least indirectly, by the famous series of Crespi. Longhi completed his series before 1757, when Marco Pitteri began to engrave them. No less poetic and evocative is the chronicle of the worldly diversions and domestic life of Venetian nobility in such pictures as the *Masked Reception* (St. Louis, Mo., City Art Mus.), the various versions of *The Ridotto* (Venice, Coll. Salom; Gall. Querini Stampalia; Bergamo, Acc. Carrara), *Portrait of the Giant Magrat* (1757), *The Perfume Vendor*, *Visiting Domino*, and *The Puppeteer* (1757; last-named four in Venice, Ca' Rezzonico), as well as in the wonderful series of the Perera Collection, New York.

In the 1760s Longhi returned to moral considerations, with subjects in which shrewd, good-natured observation was on occasion transformed into the open satire of the clergy found in a work dated 1761 or into the disenchanted humor of the *Lion House* of 1762 (both Venice, Gall. Querini Stampalia). The greatest work of this period in Pietro's activity was the series entitled *Hunt in the Valley* (Gall. Querini Stampalia), which was commissioned by the Michiel family and quickly became celebrated through the prints of Pitteri. As he had done in *Luncheon in the Gardens by the Lagoon* (Venice, Ca' Rezzonico) and *Duck Hunting* (PL. 185), slightly earlier in date and also some of his finest work, in the seven episodes of the *Hunt in the Valley* Longhi presented anecdotal landscapes free of any pastoral conventions and in such a straightforward manner as "to presage Gogol" (Roberto Longhi).

In his last works, however, Pietro Longhi began to show signs of weariness. The rustic scenes he produced in increasing numbers rarely avoided a purely mannered aspect, and even the best of these — the four in the Paolucci Collection (Ferrara; one dated 1775) and the two in the Bisacco-Palazzi Collection (Venice; 1779) — do not achieve the vivid honesty of

the *Hunt in the Valley* series. The artist could no longer capture the ironic, charmed atmosphere of the *Lion House* when he came to paint the *Elephant* (Venice, Coll. Salom) or the *Bison* and *Lynx* (1770; both Venice, Gall. Querini Stampalia), in which the interest becomes merely illustrative. Nonetheless, he was at times still able to fix with unbiased perceptiveness the human and historical character of his period in scenes of domestic life, such as *The Hand Kissing* (formerly Venice, Coll. Giovanelli), *Visit to Grandmother* (Venice, Curtis Coll.), and *Adriana Giustinian Barbarigo with Her Son* (1779–80; Venice, Mus. Correr), in which the summary definition of silhouettes, the subdued tonality, rendered as if somehow veiled and yet without the customary chiaroscuro, and the stiff array of figures in a single row and in unnaturally immobile poses all contribute to an extraordinary evocation of the static Venetian society of the last days of the republic.

Upon clarification of the stylistic traits of the artist's son Alessandro, and with the consequent sorting out of his production, the catalogue of portraits relegated to the hand of Pietro Longhi has become much more limited. Perhaps the earliest of those remaining is one of an unidentified nobleman (ca. 1750; Cambridge, Mass., Fogg Art Mus.), which was followed by — among his more intense characterizations — *Francesco Guardi* (1764; Venice, Ca' Rezzonico), the full-length *Ludovico Manin* (1764; Udine, Mus. Civ.), *Stefano Querini* (Paris, Coll. M. Cailleux), and *Matilde Querini* (Algiers, Mus. Nat. B. A.). Both of the Querini portraits can be dated 1772. The unique refinement of color and the discerning characterizations of Pietro's portraiture served as a model for the portraits of Alessandro, the only noteworthy successor to his father in the continuation of the style.

ALESSANDRO. Alessandro Longhi was born on June 12, 1733, in Venice, where he died in 1813. As a boy he was sent by his father Pietro to the school of the Venetian portraitist Giuseppe Nogari, whom he succeeded at the Accademia in 1759. In 1762 he supervised a biographical compendium of Venetian painters, *Compendio de' pittori veneziani . . .*, for which he also executed 24 portrait engravings. From 1773 to 1779 he taught at the Accademia, for which he painted the allegory *Painting and Merit* and the portraits of the doges Alvise Mocenigo (1767) and Paolo Renier (1781), as well as the posthumous portraits of Paolo Veronese, Titian, Tintoretto, and Jacopo Bassano, commissioned in 1770 for the galleries of the Accademia. (This last group of portraits of painters has been lost.)

A portrait of Gioacchino Cocchi, Alessandro's earliest known work, which Jacopo Gradenigo recorded as being exhibited on the façade of S. Geminiano on May 24, 1757, is lost. In the datable early works surviving — such as the *Pisani Family* (1758; Venice, Bentivoglio d'Aragona Coll.) or the portraits of Venetian magistrates, *Alvise Renier*, *Prospero Valmarana*, and *Vincenzo Dona* (1759; Venice, Doges' Palace) — Alessandro demonstrates the gifts of acute observation and the subtle painterly freedom of his father, rather than the luminous chiaroscuro and decorative manner of the portraiture of Nogari. Although such traits of Nogari are echoed in the background and in the allegorical figures of the *Pisani Family*, the most lively and appealing segment of this large painting is the group of adults with their brood of children, which appears quite like an enlargement of the small family portraits of Pietro. The same fine stippling of color and humanity of characterization also mark *Angelo Memmo IV* (1760; Venice, Mus. Correr) and the so-called *Balotin del Doxe* (Belluno, Mus. Civ.), this last probably a fragment of the second large Pisani family portrait mentioned in the *Compendio* of 1762.

Alessandro's paintings of the 1760s, which maintain the exceptional freedom of his father's technique but are more awkward on the surface, are distinguished by careful study of individual physical and psychological characteristics. This discerning character study is evident in the following examples from these years: the masterly engravings for the *Compendio*; *Giulio Contarini da Mula* (ca. 1759; Rovigo, Pin. dell'Acc. dei Concordi), admirable for its delicate modulation of grays; *Carlo Goldoni* (Venice, Casa Goldoni; no. 143); *Antonio Renier*, *Provveditore Generale di Dalmazia e Albania* (1765; PL. 186), with deft gradations of flaming red in the costume; the stately *Grand Chancellor Giovanni Colombo* (1766; Venice, Coll. Cini); and the extremely vivid *Painter Urbani* (1766; Mestre, private coll.). All these works share the remarkably delicate sensibility to color apparent also in the allegorical *Painting and Meri* (Venice, Accademia).

Seeking always to vary the style of his father, in the portraits of his mature phase Alessandro often struck a perfect balance between restraint of pictorial means and acuteness of observation, a tone no less effective than that of Ceruti but not so harshly objective. His sitters during these years, for the most part, were churchmen, as in the two portraits of prelates (Venice, I. Brass Coll.; one dated 1777), the *Abbot* (1776; Uffizi), and the *Parish Priest* (PL. 186); or they were representative of the Venetian bourgeoisie and its pursuits, such as the architect *Tommaso Temanza* and the agricultural theorist *Father Carlo Lodoli* (both, Venice, Accademia), the engineer *Bartolomeo Ferracina* (ca. 1770; Venice, Ca' Rezzonico), the doctor *Gian Pietro Pellegrini* (Venice, Ateneo Veneto), *Captain Pietro Budinich* (1781), and *Count Giuseppe Rusteghello* (last two, Venice, I. Brass Coll.). In the contemporaneous full-dress portraits, the grandiloquence of ceremonial portraiture is saved from pure caricature and theatrical color effects by a keen irony that, while suggesting the satiric edge of Goya, has been mitigated by the artist's Venetian good nature. Examples of such formal commissions in these decades include the *Bishop Ganassoni* (Feltre, Seminario) — dated 1774, as is the signed sketch of the same sitter by the senior Longhi (Ca' Rezzonico) — and the portrait of a pompous admiral, *Alvise Foscari* (1782; Venice, Pal. Widmann-Foscari).

In the early 1780s there is apparent a cold academicism in the figures of the apostles Thaddeus and Matthew (1780), the *Justice* and *Prudence*, the *Works of Mercy*, and *Charity* (1782; all Venice, S. Pantalon), all of which testify that Alessandro lacked an affinity for the sacred genre. On the basis of a statement of G. A. Moschini (1815), who mentioned an altarpiece of the Sacred Heart of Jesus in the Oratorio dei SS. Pietro e Paolo as Alessandro's "most recent work," it can be inferred that the artist had returned to such subjects late in his career.

Although little is known of his last works, the arresting naturalism and coloristic refinement of some late signed works, such as the *Capitano Generale del Golfo Giovanni Battista Contarini* (1787; Treviso, Mus. Civ.), *Monsignor Giovanni Piccardi* (1793; Venice, S. Maria del Carmelo), and the so-called *Tappezziere* and *Boy with a Pony* (both, Venice, I. Brass Coll.) indicate that Alessandro Longhi remained essentially outside the neoclassic current prevailing during his final years.

LOOS, ADOLF. Austrian architect (b. Brno, or Brünn, Dec. 10, 1870; d. Vienna-Kalksburg, Aug. 23, 1933). The son of a sculptor, Adolf Loos was trained at Dresden Polytechnic. During a three-year sojourn in America (1893–96) he became a skilled bricklayer. From 1896 on, his permanent residence was in Vienna, interrupted only by a stay in Paris from 1924 until 1928 and by frequent travel abroad. For several years he conducted a private architectural school. A brilliant critic, Loos wrote numerous penetrating and witty didactic essays on architecture, art, and culture.

Loos gained international repute, and still is best known, for his opposition to ornamentation, as ultimately formulated in *Ornament and Crime* (*Ornament und Verbrechen*; 1908). His attitude, however, has been much misunderstood. To Loos, the disappearance of ornament was not an esthetic postulate but a historic phenomenon; the outcome of a "natural" process within the evolution of human culture, with far-reaching economic implications. The problem of modern architecture, he felt, is not to create "new form" but to build in the "new spirit": more precisely, in the spirit of the culture of modern man. Basically, this means an insistence on the human element — man's nature, life, and requirements — as the essential condition of architecture. Such is the quintessence of Loos's teaching, contained in all his writings, and most clearly and consistently expressed in his architecture.

His unexecuted projects outnumber his actual buildings. The latter are, with one exception, on a comparatively small scale, but all are characterized by elegance, formal clarity, beauty of material and functional logic. Most significant among the earlier works are the Café Museum (1899; Vienna), Villa Karma (1904; Montreux), the Kärntner Bar (1907; Vienna), the monumental Goldman and Salatsch Building (V, PL. 102), and the Scheu house (1913; Vienna), the first modern house with roof terraces. Loos's most decisive and original architectural discovery was the "three-dimensional plan," the organization of the building volume as an integral whole, without continuous horizontal subdivisions; that is, distributing and coordinating rooms of different heights on different levels. First applied in the Goldman and Salatsch Building, this structural principle, revolutionary in its psychological and economic aspects, is dominant in all of Loos's later buildings, for example, the Rufer house (1922; Vienna), Tzara house (1926; Paris), Moller house (1928; Vienna); and Müller house (V, FIG. 231 *b*). In these structures, in all probability, is found the genesis of contemporary "open planning"; there is spatial flow, but it is typically without the interpenetration of interior and exterior space that was to emerge in the work of others.

The magnitude of Loos's influence on architecture and architectural thought in modern times, the effect of his ascetic doctrine and austere work in his time and since, is as yet far from fully realized.

Ernest H. BRANDL

LORENZETTI, AMBROGIO AND PIETRO. The Lorenzetti brothers were Sienese painters (Pietro b. ca. 1280, d. 1348?; Ambrogio d. 1348?), their family relationship documented by an inscription ("Hoc opus fecit Petrus Laurentii et Ambrosius eius frater MCCCXXXV"; recorded by Ugurgieri) appearing on frescoes on which they collaborated in the Hospital of S. Maria della Scala, Siena. Pietro was probably the elder of the two, as his name appeared first. His birth date is based on the first piece of documentary evidence concerning him — the record of a payment made to him on Feb. 25, 1306, by the Sienese government for an unknown painting; use of the diminutive form "Petruccio" suggests that Pietro was still a young man, but he must have been at least twenty-five years old to receive payment directly. Nothing is known about the date of Ambrogio's birth. Further records state that Pietro (in 1341 and 1344) and Ambrogio (in 1324) were living in Siena.

Documentary evidence regarding the artistic activities of both is scarce. The earliest certain documentation regarding a work by Pietro is the contract dated Apr. 17, 1320, for the painting of the altarpiece in the Pieve di S. Maria in Arezzo, commissioned by Bishop Guido Tarlati (PL. 191). The next documented work is the altarpiece for S. Maria del Carmine in Siena (PL. 190), signed and dated 1329. Later the altarpiece was dismantled and moved to the town of Sant'Ansano a Dofana and was subsequently reassembled in the Pinacoteca in Siena. The first certain document for a work by Ambrogio is the inscription on the *Madonna* in the Church of Sant'Angelo a Vico l'Abate (near San Casciano in Val di Pesa) in Florentine territory, which bears his name and the date 1319. Since the next document, dated 1321, regards the seizure by creditors of a suit of clothes left in the house of Nuto Vermigli in Florence, it is probable that Ambrogio's first Florentine sojourn took place during the years 1319–21. After a stay in Siena, where he sold a piece of land in 1324, a second Florentine period is attested by Ambrogio's admission as a painter to the Arte dei Medici e Speziali (Guild of Physicians and Apothecaries) in 1327. He must have remained in Florence at least until 1332, the date established for the triptych in the Church of S. Procolo (no longer extant), now reassembled in the Uffizi; possibly Ambrogio lived in Florence even longer.

The activity of the two brothers was united in Siena in 1335, when they both signed the frescoes (now destroyed) in the Hospital of S. Maria della Scala; nor did their collaboration end at this point. The Lorenzettis worked together on a number of projects throughout the years, as they must have also worked together in the Cathedral of Siena. Pietro was commissioned in 1335 for the St. Savinus altarpiece in the Cathedral; he probably worked on this for a long time, because *The Birth of the Virgin* (PL. 192) — proved by Bacci on the basis of an old inventory to have formed part of the altarpiece — is signed and dated 1342. According to the same source, Ambrogio's *Presentation in the Temple* (now Uffizi) was originally on the nearby altar of St. Crescentius in the Cathedral. Other documents show that Ambrogio was at work on the *Presentation* in 1339–40, and it too is signed and dated 1342.

Although in 1335 and 1339 Ambrogio is known to have been engaged on various small works in the Cathedral, during the 1335–45 period he was largely employed by the Sienese government, for which he painted a number of scenes (no longer extant) from Roman history on the exterior of the Signoria rooms in the Palazzo Pubblico (1337). Also in the Palazzo Pubblico, in the Sala della Pace, he painted the celebrated frescoes of the allegories of Good and Bad Government (PLS. 194–

196); payments recorded in 1338 and 1339 may have been for these. In 1340, according to the chronicle of Agnolo di Tura, he painted the fresco of the Madonna in the upper loggia of the Palazzo. In 1344, for the Sala del Mappamondo in the Palazzo Pubblico, Ambrogio did a map of the world on canvas on a rotating frame; the work is now lost, but it has given the hall its name. *The Annunciation*, also 1344 (now Siena, Pin.; PL. 198), was painted for the Sala dei Donzelli, Palazzo Pubblico. Since the attribution of a small painting (dated 1344) in the Sala di Attesa is disputed, *The Annunciation* is the last signed, dated, and documented work by Ambrogio. An *Annunciation* painted in 1344 on the façade of the Church of S. Pietro in Castelvecchio is unfortunately lost; the badly preserved yet still beautiful panels of the Virgin and of various saints now in the neighboring parish house appear to have belonged to the high altar. Ambrogio also painted other figures (about which no further information exists) in 1345. It is known that in 1347 he was a member of the Consiglio dei Paciari.

Concerning Pietro we possess some extremely controversial data relating to the altarpiece with the stories of the Blessed Humilitas (1316 or 1341; painted in Florence for the Convento delle Donne di Faenza; VI, PL. 378) and to the *Madonna and Angels* (probably 1340; originally Pistoia, S. Francesco; X, PL. 488), both now in the Uffizi. In any event, in 1341 Pietro is known to have been in Siena and in a good financial situation, since he was obliged to pay a special tax which the city levied on wealthy citizens. In 1342 he bought some property at Bibbiano for Cola and Martino, orphans (probably minors) of the sculptor Tino di Camaino, and in 1344 he sold them some property in the same town. Near Bibbiano, in the church in Castiglione del Bosco, Brandi has found frescoes of the Annunciation and of saints, dated 1345, which he attributes with great plausibility to Pietro. These would therefore be Pietro's last known works. After 1347 all trace of the brothers vanishes, and biographers have assumed that the Lorenzettis were among the victims of the plague that devastated Italy in 1348.

On the basis of this fragmentary and sparse documentary evidence, art historians have attempted to reconstruct the stylistic development of the two brothers, for the most part without clues to the dates of the large body of works carefully studied. This is an arduous and as yet uncompleted task. Moreover, the controversial chronological data furnished by the two works in the Uffizi, *The Blessed Humilitas* and the *Madonna and Angels* from Pistoia, have proved to be more a hindrance than a help. The importance of finally establishing the dates of these two paintings is enormous: if it could be proved that *The Blessed Humilitas* altarpiece was painted in 1316 and the *Madonna* in 1340, we would have two certain fixed points for the beginning and the end of Pietro's career. But in actual fact the date of the former is provided only by a copy in Roman numerals of a lost inscription, made not earlier than the 19th century, which historians have read as both 1316 and 1341, because of the obscurity of one of the symbols. The *Madonna*, though it has been date dwith more probability, is badly abraded and has been reconstructed on the basis of conjecture. As a result of these uncertainties, several hypotheses for the development of Pietro's art have emerged: If *The Blessed Humilitas* altarpiece is, in fact, a youthful work, Pietro began his career with the full and mature derivation from Giotto evident here; he then moved toward a style substantially Gothic in concept, from which he subsequently receded, finally and gradually resuming Giotto's teachings. Such an inverse progression, however, would appear unlikely, if not impossible. On the other hand, if *The Blessed Humilitas* is a late work, then Pietro's approach to Giotto was a slow development. It has also been suggested, on internal as well as external evidence, that the painting was executed at an approximate midpoint between these two dates. (See below for further discussion.)

Ghiberti, the first of the early writers on the Lorenzettis, strangely ignored Pietro and outlined the development of Ambrogio's artistic personality within the historical framework of a Humanistic evolution of the Gothic in the light of the new premises of Giotto's art. He called Ambrogio "nobilissimo compositore" (very noble composer of pictures) for his frescoes in S. Francesco in Siena, which Ghiberti was the first to ascribe to him, and "nobilissimo disegnatore" (very noble draftsman) in describing Ambrogio's classical orientation in his drawings of an antique statue found in Siena. It was also Ghiberti who first mentioned Ambrogio's Florentine works in Sto Spirito and S. Procolo. Vasari followed Ghiberti and did not realize that Pietro, to whom he devoted a separate "life" under the incorrect name of Pietro Laurati (based on a misreading of the signature on the Pistoia *Madonna and Angels*), was the brother of Ambrogio. Vasari states explicitly that Pietro was a pupil of Giotto and that he was also active in Rome. He provides detailed descriptions of Pietro's works in Arezzo (frescoes, now lost, in the Pieve di S. Maria), followed by a period of activity in Cortona; some of Pietro's Cortona works later came to light. Vasari also attributed *The Hermits* in the Camposanto in Pisa to Pietro, but this attribution was later refuted by Rosini and Supino.

The fact that Pietro and Ambrogio were brothers was first recognized critically by the Sienese writer G. della Valle (1782), despite the fact that their relationship was explicitly stated in the inscription on the frescoes of the Hospital of S. Maria della Scala in Siena. These frescoes had survived until the 18th century, but after the sheltering roof over the works was removed they were obliterated. Della Valle refuted the derivation from Giotto proposed by earlier art historians and advanced a purely Sienese origin and development. It has been left to modern art historians, however, to attempt to trace a clear evolution of the art of both brothers. Cavalcaselle (1864) made a fundamental contribution by attributing to Pietro the cycle of frescoes in the left transept of the Lower Church of the Basilica of S. Francesco in Assisi (PLS. 188, 189; VI, PL. 62). He pointed out that the artist followed certain Gothic trends not easily reconcilable with Vasari's classification of Pietro as a follower of Giotto, or with the stylistic information provided by *The Blessed Humilitas*, which Cavalcaselle had the vision to introduce, even though tentatively, into the Lorenzetti problem. (This altarpiece had hitherto been believed to be the work of the legendary Buffalmacco.) Decisive contributions to Lorenzetti scholarship were made by Berenson, A. Venturi, and especially F. M. Perkins, who, in commenting on Vasari's life of Pietro, first treated the whole of Pietro's activity (1912), as Von Meyenburg had done for Ambrogio (1903).

Fundamental for the study of Ambrogio's art was G. De Nicola's discovery in 1922 of the *Madonna* in Sant'Angelo a Vico l'Abate. This moved the beginning of Ambrogio's known activity back to 1319, at which time he appears to have been so mature that De Nicola thought him older than Pietro, to whom Ambrogio could have directly transmitted innovations from Giotto after his Florentine sojourn (ca. 1319–21). Reconstruction of the Florentine period received a further contribution from the discovery by Perkins and De Nicola of some of Ambrogio's S. Procolo paintings mentioned by Ghiberti. Step by step the problem of the relation of the two brothers with Sienese art and the art of Giotto entered into a phase of more subtle and complex elaboration. Attempts were made to establish a general historical reconstruction by Van Marle (1924), Weigelt (1930), De Wald (1930), Cecchi (1930), and Péter (1933). But their efforts were always hampered by the difficulty of placing in a logical sequence the undated works revealing diverse tendencies and those works showing the influence of Giotto, particularly Pietro's Uffizi paintings and the markedly Gothic cycles by Ambrogio in S. Francesco in Siena and by Pietro in the Lower Church in Assisi. This thorny problem has sometimes been side-stepped by excluding from the *œuvre* of Pietro the perpetually contradictory *Blessed Humilitas* and by attempts to create autonomous collaborators such as the "Master of Assisi" (Péter, for the Assisi frescoes) or the "Master of Dijon" (De Wald, for the works of Pietro's last period). The tendency to free the two artists from superfluous attributive incrustations has led to the successful transfer of a group of works formerly attributed to Pietro to a master whom Berenson named "Ugolino-Lorenzetti." To this master M. Meiss has now reattributed the works formerly ascribed to De Wald's "Master of the Ovile Madonna." But G. Rowley's identification of as many masters (of Rofeno,

of Pompana, of St. Petronilla) as there are evolutionary phases in the course of Ambrogio's activity is an extreme solution. The monograph by G. Sinibaldi (1933), attempting to define the art of the two Lorenzettis, has the undoubted merit of treating both artists, despite their differences, as a single phenomenon in which 14th-century Sienese art came closest to the incipient Florentine Humanism and yet, in its greater freedom and vitality, remained the irreconcilable antithesis.

The direction of recent studies, begun by R. Longhi, has been in reaction to critical excesses. Denying that Florentine 14th-century painting was a sterile academic imitation of Giotto or was totally subservient to Sienese influences, Longhi recognizes in the works of the Florentine painters Maestro Stefano and Maso di Banco a vital elaboration of Giotto's premises into a new kind of painting that contains the seed of the Renaissance; the work of the Lorenzettis can be fitted into the frame of this intense artistic activity. And while Toesca (1951) once again sees the evolution of Pietro, and to a lesser extent of Ambrogio, concluding in the Gothic involution of all the art of the Sienese 14th century, younger scholars such as C. Volpe follow the lines indicated by Longhi, tending more and more to trace the complex relationship between the arts of Siena and Florence through the art of the Lorenzettis.

A survey of the present state of critical opinion regarding the Lorenzettis shows that the two brothers cannot be considered separately, not only because of their collaboration — which, as Toesca believes, was probably closer than the sources and inscriptions indicate — but also because their art reveals a definite trend in the art of 14th-century Siena at the very time when the leading position was held by Simone Martini in succession to Duccio (qq.v.). The primary origin of the Lorenzettis' art in the school of Duccio constantly enters into the works of the two brothers until the last stages of their maturity. It is probable that Pietro, about whom we have the earliest information, however uncertain, pointed the way to an original break from that school. This break may be seen in those of his works which differ from the output by the anonymous mass of Duccio followers, showing a stronger perception of form and an awareness of the new trends marked by Giotto in his Assisi frescoes. (This awareness also appears in Duccio's own last narrative panels for his *Maestà*.) The new trends can be seen less clearly in the *Madonna* of Casole d'Elsa (attributed by De Nicola to Pietro but by Bacci, on better grounds, to Segna di Bonaventura) than in the *Madonna* of the Church of S. Pellegrino, Siena (Siena, Pin., No. 18); before Adolfo Venturi's attribution, the S. Pellegrino *Madonna* was believed to be by an almost unknown Gilio di Pietro. The same trends can also be seen in the complex of panels related to the *Madonna* in the Pinacoteca Comunale in Città di Castello, which Cavalcaselle had attributed to Pietro's early years. (For these questions cf. Brandi, 1933.)

That the foregoing may have been the premises of Pietro's development, even though proof for a definitive exegesis is lacking, is suggested by Pietro's first documented work, the polyptych in the Pieve di S. Maria in Arezzo (PL. 191), painted 1320–21. Here, together with the Byzantinism of certain figures in the manner of Duccio, there are elements reminiscent of Giotto. The plasticity of Pietro's figures in the Arezzo work is obtained by means of harsh contrasts as yet unresolved by a complete blending of colors. This recalls the work of certain collaborators in Giotto's St. Francis cycle in Assisi, in which C. Gnudi (*Giotto*, Milan, 1958) has noted a "free and vivacious sensibility" of Sienese influence. With this in mind, it is well to remember Vasari's reference to a Pietro who was a student of Giotto and active in Rome, where Giotto went after leaving Assisi on the eve of the Jubilee of 1300; but the reference is as yet only a hypothesis for further investigation.

A Florentine product, the *St. Lucy* in the Church of S. Lucia dei Magnoli, may provide important clues to the early works of Pietro. The removal of the complete repainting by Jacopo del Sellaio reveals in the few surviving areas, apart from some tenuous reminiscences of Duccio, a compact plasticity that recalls the early Giotto. This plasticity is encountered in certain parts of the Arezzo polyptych. Various similarities to the work of Giovanni Pisano, which have often been noticed in this work, may be the result of an interest in sculpture stimulated by Pietro's early association with Giotto, in Assisi, or more probably in Florence. However, in the Arezzo work (1320–21) the tense, spiritual quality of the figures is enriched with subtle lyrical accents and tends to be controlled by the harmonic cadences of the Gothic style of Simone Martini, who had returned to Siena from Naples after 1317.

Pietro's youthful experiences would seem to have concluded in 1320 with this orientation. Thus if *The Blessed Humilitas* altarpiece is correctly dated 1316, it would be extremely difficult to include it among Pietro's works, for here is a mature product in which the Giottesque interpretation has already achieved a vigorous pictorial conviction far distant from the influence of Duccio or Gothic tendencies. To achieve this style, from which it probably would have been impossible for the artist to recede, Pietro must have passed through other evolutionary phases, which art historians are attempting to reconstruct.

The gap of nearly ten years between the polyptych of Arezzo and Pietro's next documented work, the 1329 altarpiece painted for S. Maria del Carmine in Siena (PL. 190), has been filled with works either lacking or only partly provided with chronological indications; such works include those found at Cortona (the *Madonna* in the Cathedral and the large *Crucifix*, now Mus. Diocesano), those from the Convento di S. Francesco in Siena, and frescoes in the Lower Church of S. Francesco at Assisi (PLS. 188, 189; VI, PL. 62). Art historians, following Cavalcaselle's suggestion, have attempted to link Pietro's Assisi cycle (particularly *The Crucifixion*, *The Deposition*, and *The Resurrection*, which iconographically follow the *Childhood* and *Adolescence* frescoes by Giotto followers in the opposite arm of the transept) with the large Cortona *Crucifix* and another *Crucifixion* (formerly, Chapter House, Convento di S. Francesco, Siena; now in the Church of S. Francesco, Siena; PL. 191), as well as two scenes from the life of St. Louis of Toulouse (PL. 197) and the scene of the Franciscan martyrs, which since the time of Ghiberti had been regarded as the work of Ambrogio. Here we find ourselves in the very thick of the most controversial Lorenzetti problems, because in nearly all of these works there stand revealed the elements of an idiom totally and lyrically Gothic, with no parallel in either the Arezzo polyptych or the certain later works of Pietro, from the Carmelite altarpiece (1329; PL. 190) to *The Birth of the Virgin* (1342; PL. 192). This anomaly has led to innumerable attempts to arrive at a coherent chronological position for this whole group within the artistic evolution of Pietro, especially for its most important component, the Assisi cycle. These attempts range from early datings for the Assisi frescoes (ca. 1320; Cavalcaselle, 1864), or even earlier (Volpe), to intermediate ones (1325–29; De Wald, Cecchi, Brandi, Carli), to very late, even after 1340 (Péter, Toesca). On the basis of a progressive identification of elaborate Gothic mannerisms, different dates have even been proposed for the two sections of the frescoes: those on the walls of the transept, dominated by the magnificent *Crucifixion*, and the scenes of the Passion in the vault. The two periods may be included within the years 1325 and 1329 (De Wald, Cecchi), or 1325–29 and the years following 1340 (Péter). However, Péter believes, as did Thode and Venturi, that the works of this very late period represented a continuation by assistants, among whom Péter singles out the principal one, designating him the "Master of Assisi."

The dating problem of the Lorenzetti frescoes in Assisi is not clarified by the assumption that they were painted concurrently with the Giottesque frescoes in the crossing and right arm of the transept, because there are no positive dates for those either. The problem has become further complicated, since the first attempts to solve it were made by Thode and P. Schubring, by the recognition of features in common between some of the Giottesque frescoes and the late style of the Lorenzettis, without any indication as to who influenced whom. Up to now the only basis for dating the whole transept is the fact that the decorations of the two chapels at either end were commissioned by the brothers Napoleone and Giovanni Orsini, both cardinals, who had intended these areas as funerary chapels.

Only the chapel in the right transept, commissioned by Giovanni and decorated by followers of Giotto, was ever completed with a monumental tomb; this can therefore be considered earlier. And since in a fresco over the arch of this chapel Giovanni is depicted (as Schubring noted) as a young man without the insignia of the cardinalate, which was conferred on him in 1316, the beginning of the chapel can be determined as somewhat prior to 1316. In the Napoleone chapel at the opposite end of the transept, the work of Pietro is evident in the frescoed triptych of the Madonna between St. John the Baptist and St. Francis, but the touch is more experienced in linear subtleties and chromatic blending than in Pietro's Arezzo polyptych.

By 1326 the Lorenzetti brothers were engaged in frescoing the Chapter House of the Convento di S. Francesco (now the Pontifical Seminary), Siena, in the increasingly Gothic manner that was already apparent in Pietro's works in both Assisi and Cortona. By combining links in a chain of evidence, and bearing in mind certain affinities (as Péter and Volpe noted) in Ambrogio's narrative paintings and his *Madonna* of Sant'Angelo a Vico l'Abate (1319), a partial Lorenzetti chronology for the period 1320–40 can be hypothesized: Pietro, when he had completed his work in Arezzo in 1321, received the commission for the chapel of Cardinal Napoleone Orsini in Assisi, on which he worked more or less concurrently with his paintings in Cortona. The triptych on the terminal wall of the Napoleone chapel has in common with the Cortona works a more mature stylistic development, and it may be supposed that this was the starting point for the subsequent commission for the frescoes in the whole of the left arm of the transept, executed while Giotto's followers were completing the right arm. In these first years of the decade 1320–30, after Ambrogio had returned from Florence (1321), both brothers might have received the commission for the Chapter House of S. Francesco in Siena. It may be assumed that the feverish activity of these years was fostered by the Orsinis: Giovanni, by then a cardinal and apostolic legate in Tuscany, blessed the first stone of the new Franciscan church in Siena in 1326.

The period of about 1321–27, when Ambrogio was in Siena, provides a possible date for the Assisi frescoes, but if they were preceded by Pietro's activity in Cortona and in the Napoleone Orsini chapel, the beginning date might be slightly later than 1321. Further work on the Assisi transept could have been carried out by Pietro at the same time as the Siena Chapter House frescoes (of which the greater portion is by Ambrogio, who may have remained there alone to paint them); the Assisi work could have continued in the following years until its conclusion in the Passion cycle on the vault by assistants, who carried out Pietro's intentions and projects some time after he had reached a further stage in his stylistic evolution, as revealed in the Carmelite altarpiece (1329; PL. 190) and subsequent works. Such a chronological sequence, even if the evidence is circumstantial, could explain how the Gothic elements in Pietro's art (of which the first indications appear in the Arezzo polyptych and which become predominant in Assisi, Cortona, and in S. Francesco in Siena) do not constitute the definitive direction of his artistic development but represent only a phase during which he participated in the general trend of Sienese art. This phase (1320–40) is found simultaneously in the work of Ambrogio. It also corresponds to Simone Martini's return to Siena from Naples, between 1317 and 1321, which marked the end of the predominance of Duccio's style.

Simone, who had absorbed the culture of France while working at the Angevin court of Naples, brought with him the persuasive refinements of the French style, which constituted the synthesis of the very rich heritage of the Middle Ages then spreading from France throughout western Europe. Although art historians have often attempted to discount any link between the Lorenzettis and Simone, such contacts were noticed as early as the late 18th century by Della Valle and are manifest in all the Lorenzetti works dating from the decade when Simone was the dominating artistic figure in Siena and other parts of Italy. Ambrogio's *Madonna* in Sant'Angelo a Vico l'Abate (1319) is free from the plastic harshness of Pietro's Arezzo work because Ambrogio was able to achieve Simone's luminous color and linear fluidity without being obliged, as Pietro was, to overcome the influences of an early training in the school of Giotto. From Giotto, Ambrogio derived only the tone and the diffused calm; the frontal rigidity of the image seems to reflect Simone Martini's *Majestas* (PL. 332; in its original 1315 version, before the 1321 restoration) in the same way that it was repeated in San Gimignano in 1317 (*Maestà*, Palazzo Com.; signed by Lippo Memmi).

The assignment of certain works to this early period of Ambrogio's activity is not wholly convincing, even if their attribution is certain. The *Madonna* in the Brera, Milan, seems rather to reflect the more decisive and complex plastic intentions of later years; the polyptych of the *Crucifixion, Four Saints, Nativity, and Annunciation to Shepherds* (Städelsches Kunstinst., Frankfort) reveals a full spatial mastery not even reached in the S. Francesco, Siena, frescoes. Of the reconstruction of this period, proposed by Volpe, only the *Crucifix* (No. 598) in the Pinacoteca in Siena, attributed by him to Ambrogio, can be accepted. In this work Giotto is once again reflected, by way of Simone. The latter artist inspired Pietro's almost manneristic stylistic effects of the small, pathetic *Crucifix* in Cortona (Mus. Diocesano). This fusion of Simone Martini and Giotto was Pietro's ideal when he painted in Assisi *The Deposition* (PL. 189), *The Entombment, The Resurrection, The Descent into Limbo, The Hanging Judas*, and *St. Francis Receiving the Stigmata*, on the left terminal wall of the transept, and the figures of five Franciscan friars; it also inspired his great *Crucifixion* (PL. 188), in which a whole medieval world (no less romantic and chivalrous than that of Simone's scene of St. Martin) is assembled at the feet of the three crosses, filling without gaps an immense space that extends beyond the limits of perspective. It matters little, so far as the lyric unity of this work is concerned, if alongside the parts painted by the master brush of Pietro there appears — and actually in the Crucifix itself — the hand of the experienced but more trite assistant to whom in subsequent years Pietro was to leave almost the entire execution of the scenes of the Passion, which he had by that time conceived for the vault.

Pietro's Arezzo polyptych (PL. 191) of 1320–21 reveals the transition from the plastic force derived from Giovanni Pisano to the Elysian harmony of Simone Martini, the two great achievements of the Sienese Gothic. A further step in Pietro's evolution is seen in the *Madonna* of Cortona, which Berenson dated 1315 but which, as Carli correctly states, was done shortly after the Arezzo polyptych, as shown by the softer blending of colors, even though the archaic structure contains reflections of Duccio's Maestàs. The Cortona *Madonna* is closely related to the triptych in the Napoleone Orsini chapel, whose progressive stylistic refinement negates the assignment suggested by some historians of an earlier date than any of Pietro's known works. The large Cortona *Crucifix* tends toward the Gothic in its reminiscences of those suffering crucifixes, gaunt in their exaggerated linearity, by such Sienese followers of Giovanni Pisano as Lorenzo Maitani. The softening of the modeling derived from Giovanni Pisano, leading to a lyrical rendering of the image, was the determining factor in the style of the *Crucifixion* in S.. Francesco in Siena (PL. 191) and of the fragment with the *Risen Christ*, still in the Chapter House of what is now the Pontifical Seminary in Siena. This softer modeling and lyric tension loses its effect, however, in the draftsmanship of Pietro's assistant in Assisi. But in the second Assisi triptych (above another small crucifix), depicting the Madonna between St. Francis and another saint (probably John the Evangelist), the melodious flow of Simone Martini's line catches the theme of Giovanni Pisano's *Madonna and Child* in a new version, bright with luminous color. This flowing line had already been revealed in the Arezzo polyptych and was here established with absolute mastery as Pietro's new style.

The evolutionary phase of about 1319–26 for both brothers is reflected differently in Ambrogio's style, although the two artists are linked by a common basic idiom. In the ample spatial organization of the two surviving frescoes in S. Francesco in Siena (the complete cycle was described by Ghiberti), as well as the ascribed fragments in London (Nat. Gall.), Am-

brogio's prior Florentine experience is clearly recognizable. In Florence Ambrogio came into contact with the mature Giotto and such pupils as Maestro Stefano and Maso di Banco — artists of a very different stature from those whom his brother saw working in the right transept of the Lower Church in Assisi. But the magnificent spatial balance that Giotto achieved after his Paduan frescoes was modified in Ambrogio's work to follow the path indicated by Simone Martini as early as the *Majestas* (1315). Giotto's enclosed unity of time and space was interpreted according to the dictates of Ambrogio's imagination, in which the actual geometric spatial reality could be turned (as in Simone's works) to lyric effects of unlimited space. In this Ambrogio differed from Pietro, who from the start of his artistic career was oriented, through the influence of Giotto and Giovanni Pisano, toward a plastic concept of form which, as a pupil of Duccio, he expressed in terms of color. During the period when the Lorenzettis followed the new Gothic trend established by Simone, they recalled and interpreted the idiom of Giotto, each according to his own lights. Pietro aspired to a deeper pictorial achievement, Ambrogio to a greater control of spatial clarity. Ambrogio's concentration on this most vital aspect of the problem stated by Giotto made him, during these years, the more progressive artist of the two. As De Nicola has pointed out, at this time Ambrogio could have taught something to Pietro.

It is difficult to follow closely the progress of the two brothers in the course of this mature evolutionary phase, since precise chronological data exist only for Ambrogio. Rowley ascribed to a hypothetical "Master of Rofeno" those of Ambrogio's works which most recall the Siena S. Francesco frescoes and those by Pietro on the transept walls in the Lower Church in Assisi (which this author considers contemporaneous). The designation "Master of Rofeno" derives from the most important of these works, the altarpiece with St. Michael, formerly in the Badia a Rofeno (now in the Mus. d'Arte Sacra, Asciano); here the archangel, depicted fighting with the dragon, is entirely surrounded by a wonderful pattern of arabesques in the manner of Simone Martini, while the Madonna in the cusp is clearly a derivation from Pietro's Madonna in the second Assisi triptych. As also in Ambrogio's *Four Saints* (Francis, Mary Magdalene, Catherine, Benedict; now Mus. dell'Opera del Duomo, Siena), which Rowley would have us believe was originally connected with the Rofeno altarpiece, the clear linear quality derived from Simone gives a more concise outline to the Giottesque forms. These same stylistic factors reappear in a complex figural dialectic in Ambrogio's superb *Madonna del Latte* (formerly hermitage of Lecceto; now Siena, Seminario), in frescoes on the façade of the church of Lecceto, and in Florence in Ambrogio's triptych from the Church of S. Procolo of the Madonna between SS. Nicholas of Bari and Proculus (now reassembled in the Uffizi). For the triptych it has been possible to assign the date of 1332, which G. Cinelli (1677) had read in an inscription now lost. It is uncertain whether Ambrogio's frescoed *Crucifixion*, which, according to the sources, was in the monastery of Sto Spirito, can also be assigned a date within these mature years. No trace of the fresco remains other than its echoes in *The Crucifixion* painted several decades later by Orcagna and Nardo di Cione in the adjacent refectory. Ambrogio's presence in Florentine painting is further attested by the evolution of Bernardo Daddi, who more than anyone else must have been close to Ambrogio between 1328 and 1333.

Pietro, who had remained in Siena during Ambrogio's second Florentine period, proceeded from Simone Martini's Gothicism toward the influence of Giotto. He was, however, not exposed to Giotto's Florentine works but rather to their feeble reflection in the art of Giotto's followers painting in Assisi. Pietro's second triptych in the transept of the Lower Church in Assisi seems to be linked with those later works in which he achieved a very delicate balance between a compositional rhythm and the enchantment of a clear color permeated with light. Such works are the *Three Saints* in the Fondazione Horne, Florence; the exquisite female saint in Le Mans (Mus. des B. A.); the *Virgin and Child Enthroned*, Philadelphia (Mus. of Art, Johnson Coll.); the two angels now in the Rabinowitz Collection, Brooklyn, New York (which possibly once flanked the Virgin of the Johnson Collection); and the Madonnas in the Church of SS. Stefano e Degna in Castiglione d'Orcia, in the Serristori Collection in Florence, in the Perkins Collection in Assisi, and in the Church of SS. Leonardo e Cristoforo in Monticchiello. In these works may be read in a clearly defined sequence the steps leading from Pietro's second Assisi triptych to the Carmelite altarpiece in Siena (1329; PL. 190), which it has been possible to reassemble in the Siena Pinacoteca from sections already available and from the recovered central part of the predella that lay beneath a 16th-century overpainting. It is not certain whether the two saints (Peter and John the Baptist) in the Vatican Museums also belonged to this altarpiece, as has been suggested by Brandi; many art historians regard them as very early works of Pietro.

In *The Madonna between Angels and Saints*, which forms the center of this sumptuous altarpiece, the influence of Simone Martini on Pietro is still very strong. It has been recognized that the Carmelite scenes depicted on the predella do not precede Ambrogio's compositions in S. Francesco, Siena, but are derived from them without achieving their monumental spatial coherence (Péter). Pietro, still aware of Duccio, used elaborate structures to form a composition of planes of clear color and set the central group (showing delivery of the Carmelite rule to St. Brocardo) in a vast space like that in which, a year previously, Simone Martini had evoked his Guidoriccio da Fogliano (PL. 334). But one senses the limits of the Gothic experience which had been reached in the Assisi cycle, even though Pietro's assistants in the Passion cycle of the vault continued to paint in this idiom, especially the so-called "Master of Assisi" to whom Péter ascribes the three saints (Bartholomew, Cecilia, and John the Baptist) in the Siena Pinacoteca (Nos. 79, 81, and 82; from S. Cecilia a Crevole; 1332). As Brandi has established, these paintings are not signed by Pietro, as had been believed. It is unlikely that Pietro would have returned to such Gothic subtleties after the new stylistic intentions of the Carmelite altarpiece. Perhaps at about this time he followed in his brother's footsteps and went to Florence, the center of the art of Giotto. This could be established if it were possible to assign a date within these years to the altarpiece of *The Blessed Humilitas* (VI, PL. 378). Cohn (1959) studied this work after the discovery by Meiss of the scattered parts (three cusps with the Evangelists and seven tondos with the dead Christ between the Virgin, St. John, and other saints) and of an 18th-century drawing depicting the altarpiece before its dismembering and the removal of two of the panels to Berlin. Cohn (1959) concluded that 1316 and 1341 were both possible readings of the date copied from a lost inscription, but outside evidence collected by both Cohn and Carli favored an early date; this evidence, however, can be countered. The research of Luisa Marcucci (1961) has brought to light other data indicating the years 1330–32, during which time the Blessed Margherita died. (Margherita is depicted in the altarpiece together with the Blessed Humilitas.) This was also the period in which the canonical text of the legend shown in the various panels was established. Such a date — a little later than the Carmelite altarpiece — would coincide fully with the stylistic phase revealed in the Humilitas work. In the latter, Pietro follows the pictorial interpretation of Giotto, already felt in the Carmelite work, reducing the total narrative to a poetic evocation of the single episodes and avoiding all Gothic linear simplification of structure, rendered through vivid color.

Ambrogio, in his painting of incidents in the life of St. Nicholas for the second altar of the Church of S. Procolo, Florence (now Uffizi), probably done after the S. Procolo triptych, recalled his brother's *Blessed Humilitas*, actually copying certain figures from it and deriving the spatial relationships and strength of color on which the formal construction is based. However, Ambrogio, with his greater mastery of perspective, elaborated the spatial element in the play of an imaginative series of rooms and vastly extended it by adding a seascape. The hypothesis of a period of activity in Florence of both brothers between 1330 and 1335 — Vasari mentions a tabernacle by Pietro in the Piazza Sto Spirito — would go far to explain many details in

their subsequent evolution. The group of paintings of evident Florentine structure attributed by De Wald to the hypothetical "Master of Dijon" (after the triptych in Dijon, Mus. B. A.) could be firmly ascribed to Pietro. Related to this group are the small *ancone* of the Museo Poldi Pezzoli in Milan, in the Berenson Foundation in Settignano (rear panel in a private collection in Rome), and in the Walters Art Gallery in Baltimore. Also close to these works, although stylistically more evolved, is Pietro's *Madonna* of the Loeser Collection (Florence, Palazzo Vecchio). The presumed Florentine sojourn of 1330–35 would also support the theory according to which Pietro, returning to Siena with the fresh imprint in his mind of Giotto's chapels in Sta Croce, Florence, was able to begin the frescoes in S. Maria dei Servi, Siena, where rebuilding had begun in 1334; the frescoes were mainly executed by assistants.

In 1335 the two brothers were reunited in Siena, where they painted the frescoes on the façade of the Hospital of S. Maria della Scala. The loss of these works has deprived us of an example of a fundamental phase of the new style of both artists. Iconographic reconstruction attempted by Péter and Marchini (1930, 1938), based on a study of the strong echoes of these works found in all subsequent Sienese painting, indicates how novel and striking the originals must have seemed to the Sienese, still accustomed to the Gothic art of Simone Martini. The two Lorenzettis must have soon supplanted Simone in his official capacity, since they received important commissions from the Opera del Duomo for the altars of St. Savinus (begun 1335) and St. Crescentius. A short time later Ambrogio must have been called to decorate the Palazzo Pubblico, the most important secular building in the city, with his celebrated frescoes in the Sala della Pace (PLS. 194–196).

A small panel now in London (Nat. Gall.), whose subject, identified by Volpe, indicates that it belonged to the St. Savinus altar, reveals Pietro's progress in the mastery of perspective, which was probably achieved about 1335. As also in another fragment, depicting Christ before Pilate (Vat. Mus.), from an unidentified larger complex, Pietro stresses far more profoundly than he did in the various episodes of the *Blessed Humilitas* scenes the value of open spaces between figures moving freely between foreground and background. Although Pietro absorbed Giotto's spatial understanding more slowly than did his brother, he realized more clearly how this might lay the foundations of a truly pictorial organization. On the basis of the evolution of Pietro's new premises, it is possible to assign dates between 1335 and 1340 to paintings that have hitherto been of controversial chronology, such as the two very beautiful saints, *Agnes* and *Catherine* (Siena, Pin.), and the *St. Clare* in the Contini Bonacossi Collection in Florence. The date of the *Crucifixion* (Cambridge, Mass., Fogg Art Mus.), so far regarded as very early, should also be reconsidered; this is a painting of vast spatial concept and intensely fused color. The date of 1340 for Pietro's *Madonna and Angels* (from Pistoia; Uffizi) can be justified, though it is legible only through the work of restorers. Despite excessive cleaning, the work displays notably fine qualities in the luminous harmony of vivid colors.

Pietro thus arrived at a pictorial resolution of spatial construction through an interpretation of Giotto's teachings that was purely Sienese in its use of chromatic values. This resolution can be seen in the admirable *Funeral of a Saint* (Assisi, Perkins Coll.) and in *The Birth of the Virgin* in the Museo dell'Opera del Duomo in Siena (PL. 192). The latter is dated 1342, although it formed part of the St. Savinus altar begun in 1335. The altarpiece has always been regarded as remarkable for its extraordinary homogeneity of perspective, in which the frame of the triptych actually forms the foreground of the space in which the whole scene is organized.

Ambrogio followed a path of development similar to Pietro's. After collaborating with his brother on the frescoes in the Hospital of S. Maria della Scala, he went on to paint the work on which his fame has since rested, namely, the frescoes in the Sala della Pace in the Palazzo Pubblico of Siena (allegories of Good and Bad Government), documentation for which covers the years 1337–39. Toesca rightly pointed out that the St. Nicholas panels in S. Procolo, Florence, seem to be their direct antecedents. To these could perhaps be added the *Allegory of Sin and Redemption* in the Siena Pinacoteca, which reveals the same spatial mastery. Pietro sought, even if he did not achieve, the closed unity of Giotto's narratives; but Ambrogio, although he had been acquainted with the work of Giotto over a far longer period, avoided such limitations. Ambrogio always remained tied to that wonderful Gothic world of multiform variety and figurative effusion; the city, with its narrow alleys and buildings haphazardly crowded together, unexpectedly rising with an aerial embroidery of loggias, terraces, and crenelated towers (PL. 194), and the undulating countryside, with its gentle mountain outlines (PL. 195), formed the setting for the swarming life that Ambrogio saw and painted. The antique statue which, according to Ghiberti, Ambrogio had carefully drawn, was transformed in his allegory into the figures of Peace (PL. 196) and Concordia, depicted in the Gothic idiom and lost in their attention to prophetic inner voices. This emotional intensity infused his Madonnas with the human quality of maternal love.

Ambrogio's works from 1340 onward are pervaded by these "rare sentiments" (Volpe). Thus the Madonnas of Rofeno and of S. Procolo are developed, with a tighter plastic organization, into the *Madonna* of Serre di Rapolano (Siena, Pin.); the *Madonna and Child* of the St. Petronilla triptych (Siena, Pin.), between St. Mary Magdalene and St. Dorothy (PL. 193); the *Madonna* of the Boston Museum of Fine Arts (formerly Platt Coll.); the *Madonna and Child* now in Washington, D.C. (Nat. Gall.); and perhaps the *Madonna* now in the Brera, Milan. The formal composition of the last-mentioned painting seems too advanced in the artist's evolution to be an early work. A careful study of this group of paintings may establish a precise evolutionary sequence more or less contemporaneous with the decoration of the Palazzo Pubblico and culminating with the great frescoed *Madonna* on the upper Loggia there, painted in 1340. It seems as if the pictorial distention of Maso di Banco and Maestro Stefano had only now become clear to Ambrogio. But even though Ambrogio adopted a new idiom in his painting, he still remained purely lyrical in concept, avoiding simple narrative concreteness. And so he continued in all the works that can be dated after 1340. The *Madonna* of the Loggia was the thematic predecessor of the *Madonna Enthroned* in Budapest (Mus. of Fine Arts) and of the *Madonna and Child* in Roccalbegna, Church of SS. Pietro e Paolo, flanked by two monumental saints; Rowley (1958) ascribed the works to different masters, but the subtle figural counterpoint develops a single lyrical concept to its logical conclusion. This series finally led to the altarpiece in Massa Marittima (Mus. Civ.) — a Madonna and Child amid a host of angels, saints, and Virtues — in which the recollections of Giotto are transformed into the typical Sienese composition of the great Maestàs. There is also a frescoed *Madonna with Saints and Angels* by Ambrogio in the chapel at San Galgano, near Monte Siepi, as well as an *Annunciation* in which the angel fills the whole space with his outspread wings. The color characteristic of these frescoes also appears in vivid flaming tones in the *Maestà* of S. Agostino in Siena, the sole surviving portion of a larger work; this color acquires a corporeal density in *The Coronation of the Virgin* (Montefalco, Church of S. Agostino), although the work is damaged and its attribution controversial. Ambrogio's progressive pictorial development culminates in the pyrotechnics of his small *Madonna, Saints, and Angels* in the Pinacoteca in Siena (No. 65), where the perspective of the throne steps painted in various colors seems to form a continuation of the luminous halo surrounding the Virgin.

While Pietro, in his *Birth of the Virgin* (PL. 192) of 1342, achieved an increasingly clear relationship between the figures and their ambient space, Ambrogio in the same year, by means of a similar perspective construction, achieved an infinite and dreamlike quality in the *Presentation in the Temple* (now Uffizi) for the St. Crescentius altar of the Cathedral of Siena. Much has been written about the perspective coherence of Ambrogio's *Annunciation* of 1344 (Siena, Pin.; PL. 198), which is surprisingly modern. But Toesca has correctly pointed out how everything in it departs from and contradicts all intentional rationality. There remains the evocation of a moment — the ecstatic mo-

ment of the Incarnation — free from all other intentions, which, as Rowley has clearly demonstrated, has no counterpart in traditional iconography.

The works ascribed to the two Lorenzettis, in a list the extensiveness of which is an indication of the interest the two brothers have aroused among art historians, are far more numerous than those which it has been possible to mention within this article. It is necessary, at least, to cite the following works that have not been discussed here.

Pietro: *St. Leonard* (Brooklyn, Rabinowitz Coll.); *St. Dorothy* (?) (Assisi, Perkins Coll.) and *St. Catherine of Alexandria* (Met. Mus.), both possibly part of the same work; *St. Clare* (Washington, D.C., Nat. Gall.); the small diptych in Altenburg, Lindenau-Museum, the signature of which Toesca regards as dubious. Ambrogio: Well-known paintings such as *The Holy Family* (Zurich, Abegg Coll.); and the two superb landscapes of controversial attribution in the Siena Pinacoteca (Nos. 70, 71).

The brothers' known activity ends in the years 1344–45. Presumably they both died in the great plague of 1348. By 1340 Simone Martini had left Siena, and thus by the middle of the century that city had lost all the great masters who had enabled her to compete with Florence for leadership in Italian art. Once Giotto had died, the great rivalry came to an end. The road of the future was not the Gothic renewal proposed by the Sienese artists but the completely new art being created in Florence. The lyricism of the Lorenzettis became sterile in the interminable series of replicas by their Sienese followers, but in Florence the influence of the production of Giotto and his followers survived to constitute the vital poetic suggestion that was, in the fullness of the Renaissance, once again brought to life by Angelico.

Luisa BECHERUCCI

Illustrations: PLS. 188–198.

LORENZO MONACO. Painter, born in Siena (1370/71), where he is inscribed as Piero di Giovanni in the books of the civil authorities. He went on to Florence, where he became a Camaldolite monk, Don Lorenzo, of the Monastery of S. Maria degli Angeli on Dec. 10, 1391 ("Memoriale" of S. Maria degli Angeli, Florence, Archivio di Stato). His career may be traced from documents through the early years of the 15th century, when he left the monastery, and he is known to have been living in 1422. If the statement of Vasari that Lorenzo died at the age of 55 is accepted, the year of Lorenzo's death must have been 1425 or 1426.

Though most Lorenzo critics and scholars have in the past tended to consider his earliest works as painting, the present-day tendency is to maintain — on the basis of the commentary by Milanesi — that his first efforts were illuminations. This appraisal is demonstrated by the illuminated "Chorals" preserved in Florence (Bib. Laurenziana, Cod. Cor. Laur. 5 and 8), dated 1394 and 1395 and executed for S. Maria degli Angeli (PL. 201). Moreover, the frescoes of the Oblate Convent in Florence, once considered to be his first productions, have since been justly ascribed by Antal, Pudelko, and Gronau to Mariotto di Nardo. Inherent in these codices, as in the other youthful works, are elements from the Orcagna style, intermingled with others from Spinello Aretino and Niccolò di Pietro Gerini, in accordance with the tradition at S. Maria degli Angeli, where a famed school of miniaturists and illuminators had flourished since the early 14th century. These same elements occur in several of Lorenzo's depictions of the Madonna (Amsterdam, Rijksmus., recently attributed to Lorenzo by Gronau; Cambridge, Eng., Fitzwilliam Mus.; Bologna, Pin. Naz.); in the *Pietà* (dated 1404) and *The Agony in the Garden* (PL. 201), both in the Accademia of Florence; in the triptych at Empoli (dated 1404; Gall. della Collegiata), the cusp of which was erroneously considered by Sirén to be the *Pietà* in the Accademia Carrara, Bergamo (in fact, the dimensions are at variance); and in the *Madonna* (dated 1405) of the Berenson Foundation at Settignano, near Florence. The characteristics of Florentine painting of the second half of the 14th century influenced Lorenzo Monaco and determined some aspects of his stylistic development between 1394 and 1405. Acquaintance with the work of Agnolo Gaddi, as well as knowledge of Sienese art and the Gothic elements that had already entered Florentine art (Giovanni da Milano and the Bolognese artists), enabled him to refine the heavy forms then current in his ambient.

From 1405 until 1413, the middle period of his activity, Lorenzo Monaco created a series of typically Gothic works, infused nonetheless with a sense of the Florentine tradition that prevented his expressing himself in purely calligraphic and decorative forms. This was the period in which the painter Gherardo Starnina returned to Florence from Spain and in which the travels of nobles and merchants fostered contacts with other regions and nations. Such qualities and new sources of inspiration are reflected in Lorenzo's art, in the panel *David Playing the Psaltery* (formerly Kassel, Staat. Gemaldegal.) and in the *St. Peter* in Munich (Lotzbeck Gal.). (These last-named are related works and, according to Sirén, are probably parts of the altarpiece for the Fioravanti Chapel in the former church of S. Pier Maggiore, mentioned by Vasari.) The same development is to be observed in other works of this period in his career: three panels in the Accademia of Florence, depicting the Crucifixion, the Virgin, and St. John (which Milanesi thought to be cusps of the lost panel from S. Jacopo sopr'Arno, the church from which they came); the gilt-glass *Madonna and Child with Saints* dated 1408 (Turin, Mus. Civico); and the pieces reconstructed as a triptych by Meiss (1958), that is, the two Louvre panels, *The Agony in the Garden* and *The Marys at the Sepulcher* (also 1408), and what must have been the central panel, the *Lamentation* in Prague (Nat. Mus.). Although only a few years separate these works from the early production of Lorenzo Monaco, the change was very marked. This can be seen in, among others, one fundamental element: the lighting, which through contrasts of light and darkness creates an aura of unreality.

Beginning in 1409 Lorenzo Monaco also resumed the illumination of manuscripts. Some of those in Choral Codex 3 (dated) of the Biblioteca Laurenziana, also executed for S. Maria degli Angeli, may be attributed to him. In dealing with these works, Ciaranfi and Salmi have suggested contacts with the International Gothic style. Similar inspiration is evidenced in Ghiberti's (q.v.) second door for the Baptistery of Florence, where stylistic and compositional affinities with Lorenzo's painting are evident (even if it is impossible to prove a direct contact between the two artists). Similarities can be noted in the torsion of the bodies, the accentuated movement of the draperies, and the landscape of harsh, angular rocks over which the light plays with a highly evocative effect. Other works of Lorenzo approximately contemporary with these miniatures are an *Annunciation with Saints* (Florence, Accademia), for which Sirén believes a *Nativity* in Worcester, Mass. (Frank C. Smith Coll.), belonged to the predella; *Flight into Egypt* (Altenburg, Lindenau-Mus.); *Adoration of the Magi* and *Visitation* (Gloucester, Eng., Highnam Court, Gambier-Parry Coll.); *Madonna and Child with Saints* (dated 1410; Florence, Mus. dell'Antica Casa Fiorentina); the altarpiece from the Church of S. Bartolomeo at Monte Oliveto, near Florence, for which there survive documents of payment beginning in 1406; the *Annunciation* in Brussels (Stoclet Coll.), which both Pudelko and Van Marle believe to be the altarpiece, known through documents (1398–1400), for the Ardinghelli Chapel of S. Maria del Carmine in Florence; the tempera polyptych *Madonna and Child with Angels and Saints* (Prato, Gall. Com.); *Madonna of Humility with Angels* from S. Ermete in Pisa (1412; Pisa, Mus. Naz.); the miniatures of 1412, documented works for S. Maria Nuova, with payments in 1412–13 (Florence, Mus. Naz., no. H74); *Madonna* (1413; Washington, D.C., Nat. Gall.); and the *Coronation of the Virgin* of the same year for S. Maria degli Angeli (PLS. 200, 202); related to this last is another altarpiece that has been broken up into panels (London, Nat. Gall.; etc.), a work executed for the former monastery of S. Benedetto Porta a Pinti.

A series of Crucifixion subjects dates from 1415 and 1418, such as that with the Virgin and St. John in S. Giovanni dei Cavalieri in Florence (one of the most dramatic and interesting works of the Camaldolite monk); the one in the museum of S. Maria delle Vertighe, at Monte San Savino; the little-known one in S. Marta, Florence, pervaded with a sense of tragic desolation; and also the version with three sorrowing figures that is in New Haven, Conn. (Yale Univ. Art Gall.). Another group of works that can be dated about 1420 constitute the period of Lorenzo's maturity. These include illuminations from S. Maria Nuova (Florence, Mus. Naz., Cod. E70); various Madonnas (Copenhagen, Thorvaldsens Mus.; Kansas City, Nelson Gall. of Art); an *Annunciation* (Vaduz, Liechtenstein Coll.); *Adoration of the Magi* (Poznań, Nat. Mus.); and the *Adoration of the Magi* (PL. 199), which Suida, Sirén, and Pudelko believe to have been the central part of the altarpiece for S. Egidio, Florence (documented in 1422). Here, as in other compositions to be discussed below, elements of the International Gothic style predominate.

It was about this time that the so-called "Master of the Bambino Vispo," a personality still obscure, returned to Florence from Spain (ca. 1416). Longhi, in agreement with Pudelko, discerns the possibility of some artistic exchange between this painter and Lorenzo Monaco and notes in his art a "subtle affected elegance . . . a tendency to unrealistic digression very rare in an Italian." If such a relation existed between the two painters, Lorenzo Monaco — as on other occasions — was capable of transforming any influence that proceeded from it, of investing it with a personal touch and a reality of its own. These gifts are evident in the three late cusp panels above the *Deposition* by Fra Angelico (Florence, Mus. di S. Marco); three predella panels showing scenes from the lives of St. Onuphrius and St. Nicholas of Bari (PL. 202); a *Nativity* (Florence, Accademia), related to the preceding panels; and an *Adoration of the Magi* and a *Visitation*, two interesting drawings in Wiesbaden (Städt. Mus.). As in the previously mentioned works of the late phase, the accented verticality and the steep upward tilt of the planes promote an air of fantasy. The figures appear evanescent and unreal because of the singular lighting, which causes them to emerge from the shadows in a refined play of luminous lines.

With the *Annunciation* and the frescoes in the Bartolini Chapel of Sta Trinita, Florence, the artistic activity of Lorenzo Monaco came to an end. In these last works the sculptural force of his figures marks a prelude to subsequent developments in Florentine painting — a direction presaged particularly in the figures of the prophets on the vault.

Lorenzo Monaco produced a vast quantity of works, an indication that his art was highly esteemed and sought after even during his lifetime. His career is also recorded in many works on which he only collaborated, as well as by the production of his students and his circle. Perhaps most notable among the many artists who came under Lorenzo's influence was Fra Angelico, now generally conceded to have been one of his students.

LORRAIN, CLAUDE (Claude Gellée). Landscape painter (b. 1600 at Chamagne, Vosges, in the French part of Lorraine; d. Rome, 1682). At an early age he moved to Rome, possibly by 1613, almost certainly by 1620. He may have been one of the *garzoni* (apprentices) employed by the Cavalier d'Arpino and Agostino Tassi on the decoration (completed 1616) of the Villa Lante at Bagnaia, near Viterbo, but the documents said to mention him there may refer to another artist of the same name. At some stage (1623?) he seems to have worked in Naples with the Flemish artist, Goffredo Wals. His principal master was, however, Tassi, in whose service he was evidently employed during the early 1620s and whose household he is said to have managed (cf. biographies of Claude by Joachim von Sandrart, 1675, and Filippo Baldinucci, 1728; also records of legal proceedings against Tassi dated 1619). In 1625, according to Baldinucci, Claude left the studio of Tassi and went back to Nancy, the capital of Lorraine, where he worked for a time as assistant to Claude Deruet, painting architectural backgrounds for the latter's ceiling decorations in the Carmelite church, now destroyed. At the end of 1626 or the beginning of 1627 he returned once more to Rome, where he remained, with only one recorded absence (in 1660), until his death in 1682.

In 1633 he joined the Accademia di S. Luca and from 1654 held various of its offices. According to Sandrart, his friends in the 1630s included, besides Sandrart himself, Pieter van Laer, Herman van Swanevelt, François Duquesnoy, and Nicolas Poussin, with whom he remained on good terms until Poussin's death in 1665. Brief accounts of visits to Claude's studio are to be found in the Roman journals of A. Félibien des Avaux (1647; Delaporte, 1958) and B. de Monconys (1665–66); his name is also mentioned several times in the correspondence of the collector Antonio Ruffo of Messina (1660–71).

In the conventional sense Claude was uneducated and wrote (badly) in a mixture of French and Italian. Though referred to by his contemporaries as Claudio di Lorena or Il Lorenese, he signed himself Claud (sometimes Claude or Claudio), with or without his surname, Gellée (Gelée, Gille).

No certain work by Claude survives from before 1630, and even up to 1634–35 our knowledge of him is largely indirect. During the early 1630s he seems to have been active chiefly as a painter of fresco decorations, of which three series, all in Rome, are mentioned by Baldinucci: those in the Palazzo Crescenzi near the Pantheon, those in the Palazzo Muti (now Palazzo Balestra) in Piazza SS. Apostoli, and some in another house belonging to the Muti family near Trinità dei Monti. The only ones remaining (assuming they are by Claude) are seven small landscapes in a frieze in the Palazzo Crescenzi, probably the earliest (ca. 1630); the rest are lost. Sandrart refers to only one of the Muti series (he does not say which); he describes it enthusiastically and in detail, however, and it is clear that this was at once Claude's latest and finest work in fresco (it was finished by 1635) and a major factor in establishing his artistic reputation.

In the meantime he had also begun to work in other media. Sandrart states that, after leaving Tassi, Claude set up on his own and painted little landscapes and buildings, a genre of which the canvas, *A View in Rome with the Trinità dei Monti*

(1632; London, Nat. Gall.), may be an example. His earliest dated work is the etching *The Storm* (1630), together with the drawing for it in the British Museum. A small painting on copper, *The Rest on the Flight into Egypt* (Trustees of the late Duke of Westminster), is dated 1631; several other paintings are datable on stylistic grounds to the same year. These were followed in 1633 by the artist's first mythological subject, *The Judgment of Paris* (Bowhill, Scotland, Coll. Duke of Buccleuch), and in 1634 by two dated etchings, *The Rape of Europa* and a *Harbor Scene* (the latter based on a picture in The Hermitage, Leningrad). Still comparatively unknown in 1633, by 1638 Claude was the leading landscape painter in Italy, with commissions to his credit from the pope, several cardinals, and the king of Spain. At the same time his style began to attract the attention of imitators and forgers — there is a documented instance from 1634 involving Sébastien Bourdon — and in 1635, in an effort to safeguard his artistic reputation, Claude began the great record of his compositions known as the *Liber Veritatis*. This book, now in the British Museum, contains 195 drawings, each one a careful copy in Claude's own hand of its corresponding painting; on the back of each is the name of the collector for whom, or the place for which, the painting was destined. The beginning of the record is incomplete, since a few paintings executed by Claude after he had started the book are not included, but the *Liber Veritatis* survives throughout in its original chronological order; from about 1640 on it forms a virtually complete inventory of Claude's pictorial output. It is therefore an invaluable guide, not only to the canon of his authentic paintings and to the size and class (predominantly aristocratic) of his circle of patrons, but also to the development of his style as an artist. (Only in the second half of the book are the drawings actually dated, but the dates of the rest can be interpolated from a sufficient number of dated paintings and etchings.)

PRINCIPAL WORKS (from ca. 1635). Unless otherwise stated, the list is based on the *Liber Veritatis* (L.V.) and its numbers. – 1636: *Campo Vaccino* (L.V. 9; Louvre); *A Seaport* (L.V. 10; Louvre); both for the French ambassador, Philippe de Béthune. – 1637: *Fête Villageoise* (L.V. 13; Lincolnshire, Brocklesby Park, Coll. Earl of Yarborough); *A Seaport* (L.V. 14; Northumberland, Alnwick Castle, Coll. Duke of Northumberland); both for Urban VIII; *A Seaport* (L.V. 28; Uffizi), for Cardinal (probably Giancarlo) de' Medici. – 1636–38: *The Temptation of St. Anthony* (L.V. 32; Prado); *The Magdalen in the Desert* (not in L.V.; Prado); *An Anchorite Saint* (not in L.V.; Prado). – 1640: *The Finding of Moses* (L.V. 47; Prado); *The Burial of St. Serapia* (L.V. 48; Prado); *The Embarkation of St. Paula* (L.V. 49; Prado); *Tobias and the Angel* (L.V. 50; Prado); all seven for Philip IV of Spain. – 1641: *Seaport: The Embarkation of St. Ursula* (L.V. 54; London, Nat. Gall.; PL. 205). – 1643: *St. George* (L.V. 73; Hartford, Conn., Wadsworth Athenaeum), both for Cardinal Fausto Poli. – 1646: *The Embarkation of Ulysses*, also called "Harbor in Mist" (L.V. 96; Louvre; II, PL. 200), for a collector in Paris. – 1647: *Pastoral Landscape* (L.V. 109; New York, Met. Mus.); *The Flight into Egypt* (L.V. 110; Dresden, Gemäldegal.); both for Parasson. – 1648: *The Marriage of Isaac and Rebekah*, also called "The Mill" (L.V. 113; London, Nat. Gall.; PL. 203); *Seaport: The Embarkation of the Queen of Sheba* (L.V. 114; London, Nat. Gall.); both for the Duc de Bouillon, but the former, at least, originally intended for Prince Camillo Pamphili. A replica of L.V. 113, and a different pendant, *The View of Delphi with a Procession* (*Sacrifice to Apollo at Delphi*; L.V. 119; Rome, Gall. Doria Pamphili; PL. 203) were painted for Pamphili in 1649–50. – 1655: *The Rape of Europa* (L.V. 136; Moscow, Pushkin Mus.; replica dated 1667 in London, Royal Colls.); *The Fight on the Bridge* (L.V. 137; Moscow, Pushkin Mus.); both for Pope Alexander VII. – 1656: *The Sermon on the Mount* (L.V. 138; New York, Frick Coll.), for François Bosquet, Bishop of Montpellier. – 1661: *Pastoral Landscape with the Arch of Titus* (L.V. 153; Trustees of the late Duke of Westminster), for Lebrun; *The Rest on the Flight into Egypt* (L.V. 154; Leningrad, The Hermitage); this, with L.V. 160, 169, and 181 (see below), forms a group of four pictures of equal size, painted for Henry van Halmale, Bishop of Ypres. – 1662: *Sacrifice to Apollo* (L.V. 157; Cambridgeshire, Anglesey Abbey, Coll. Lord Fairhaven), for Angelo Albertoni. – 1663: *Tobias and the Angel* (L.V. 160; The Hermitage). – 1664: *Psyche* (*The Enchanted Castle*; L.V. 162; Wantage, England, C.L. Lloyd Coll.). – 1666: *The Rescue of Psyche* (L.V. 167; Cologne, Wallraf-Richartz-Mus.); both for the Constable Colonna, who commissioned nine pictures altogether from Claude and was his best patron in the later years of his life; *Jacob at the Well* (L.V. 169; The Hermitage). – 1668: *The Expulsion of Hagar* (L.V. 173; Munich, Alte Pin.); *Landscape: Hagar and the Angel* (L.V. 174; London, Nat. Gall.; PL. 206); both for Count Waldstein. – 1672: *Jacob and the Angel* (L.V. 181; The Hermitage). – 1674: *Perseus, or the Origin of Coral* (L.V. 184; Norfolk, Holkham Hall, Coll. Earl of Leicester), for Cardinal Massimo. – 1675: *The Arrival of Aeneas at Pallanteum* (L.V. 185; Cambridgeshire, Anglesey Abbey, Coll. Lord Fairhaven), for Don Gasparo Altieri.

Altogether more than 200 of Claude's paintings survive, of which about two-thirds, not counting autograph replicas, are represented in the *Liber Veritatis*, as well as nearly a thousand drawings, including those in the *Liber Veritatis*. More than half the drawings are in the British Museum; the Teyler Museum in Haarlem has about a hundred. He also made 44 etchings.

Claude's position in the history of 17th-century French painting is second in importance only to that of Nicolas Poussin, and in the ideal landscape he was one of the greatest masters of all time. Starting from the northern tradition of Elsheimer, Brill (V, PL. 304), and Tassi (in contrast to Poussin, whose sources lay in the work of the Venetians and Annibale Carracci), he developed a style that was neither so heroic nor so classical as Poussin's but was capable of expressing both a more poetic mood and a livelier sense of the variety and beauty of nature. The keynote of this style is the treatment of atmosphere and light: the cool light of early morning, the brilliance of midday, or the calm glow of evening, which Claude had studied intensively in the campagna and represented with a subtlety unparalleled in his time and not excelled before the days of impressionism. The light in his paintings usually emanates from an area of the sky just above the horizon, so that the spectator may be looking directly or almost directly into it, and spreads forward and outward through the composition, permeating the whole landscape with its radiance and linking foreground and background in a continuous spatial unity. In the mid- and late 1630s, Claude tended to carry these effects almost to the point of exaggeration: massed trees in shadow in the foreground are contrasted with a misty sunlit vista, while, in some of the seaport scenes, a "tunnel of light" radiates from the sun, just visible above the horizon. (The earliest example of this treatment is in the *Harbor Scene* of 1634 in The Hermitage; it is also one of the earliest instances in the history of art.) After about 1642, however, Claude's style became calmer and his lighting more diffused, as in *The Marriage of Isaac and Rebekah* (PL. 203) or *Landscape: Hagar and the Angel* (PL. 206). An idyllic, pastoral mood permeates many of Claude's mature landscapes, and his style begins to show the influence of the Carracci-Domenichino tradition. Tall trees against the sky, fragments of classical architecture, farms and villages, distant hills, and winding streams — all these are selected and combined in such a way as to communicate a sense of enchantment and repose. The human figures, too, are in keeping. Whereas in the 1630s Claude had frequently introduced genre figures into his compositions, he now turned to sacred or classical literature for his subject matter and used for his pastoral scenes a conventional type of Arcadian shepherd. In his late work this process of idealization, of setting the imaginary world of the picture more and more at a distance from the actual world of experience, is taken even further. Claude's last paintings, which include some of his masterpieces, represent a fairyland in which the forms are so diaphanous that they hardly seem to interrupt the continuity of the air and in which the light has a mysterious, almost magical power of evocation.

To turn from paintings such as these to Claude's early drawings from nature is to discover a profoundly different mode of artistic expression, though the vision behind both is the same and the experience gained in draftsmanship was of the utmost value for the paintings. The drawings are much more varied in type and often even bolder in treatment than the early pictures. Some are rapid pen sketches of ships or buildings; others, black chalk and wash drawings of trees (PL. 204; IV, PL. 278) — the pines, ilexes, and chestnuts which then grew in the campagna in greater profusion than they do today. But the majority embody some unexpected effect of light which had caught the

artist's interest: a tree seen *contre-jour* before a view of the campagna, a prospect of changing light across the Tiber valley, a path through a sunlit wood, a moonlight effect in a Roman garden. Most of these drawings probably date from before about 1645, but there is reason to believe that Claude continued to make drawings from nature at least until the mid-1660s. In later life, however, he concentrated mainly on finished drawings executed in the studio.

Baldinucci states that figures in Claude's paintings were sometimes put in by other artists and names Filippo Lauri in this connection, but this is unlikely except in Claude's early period, when he may occasionally have handed over such an assignment to one of his friends among the Bamboccianti (q.v.). One assistant, Giovanni Desiderii, is known to have worked in his studio from 1634 to 1655, but there is no sign of studio participation in Claude's authentic landscapes. However, he did have many imitators, as well as followers, both during his lifetime and after his death. Claude was regarded as the "prince of landscape painters" by connoisseurs all over Europe (but especially in England) down to the middle of the 19th century.

LOTTO, LORENZO. Italian painter (b. Venice about 1480, as can be deduced from his will of 1546, which states that he was then about sixty-six years of age; d. Loreto, 1556). The earliest documented data are from 1503–06, when the artist was living in Treviso. On Oct. 18, 1506, he was preparing to leave Treviso, in order to fulfill a commission from the monks of the Church of S. Domenico in Recanati to paint the large polyptych now in that city (completed, 1508; Pin. Civica). In August, 1508, Lotto was again in Treviso to collect the balance of his fees for an altarpiece he had already completed in 1506: *The Virgin and Child with Four Saints* at Santa Cristina al Tivarone (near Treviso). By 1509 he was in Rome painting in the Vatican, together with Sodoma, Bramantino, and Peruzzi, "in cameris superioribus . . . prope libreriam superiorem" (i.e., in the apartment of Julius II) — in the very rooms that Raphael was soon to decorate or, possibly, was already decorating at that time. Two payments totaling 150 ducats were made out to Lotto on Mar. 9 and Sept. 18, 1509, in connection with this work. Although the artist was again in the Marches in 1512, when he signed and dated *The Entombment* at Iesi (PL. 212), there is no actual proof that he had stayed in Rome during the intervening three years; and it is highly probable, to judge from his style at this juncture, that he had visited Tuscany and perhaps had contacts with the art of Lombardy.

Then, on Mar. 13, 1513, Lotto received from Alessandro Martinengo, in Bergamo, the commission to paint the large altarpiece with the Madonna and saints for the Church of S. Stefano (now in the Church of S. Bartolomeo), which he did not complete until 1516. From this time the artist initiated a long period of activity in Bergamo and its environs which lasted, except for short and infrequent absences, until 1526.

Between 1526 and 1529 Lotto lived mostly in Venice, although he may have returned briefly to Bergamo and the Marches. To this period belong the altarpieces *St. Nicholas of Bari in Glory*, in the Church of S. Maria del Carmelo in Venice; *The Virgin Enthroned with SS. Jerome and Joseph*, dated 1526, formerly in the Church of S. Francesco al Monte in Iesi (now Iesi, Pin. Comunale); and *The Assumption*, dated 1527, in the Church of S. Maria Assunta at Celana (near Bergamo). From 1529 to 1539, although still living much of time in Venice, Lotto was again at work in the Marches, where he completed *The Crucifixion*, 1531, for S. Maria in Telusiano at Monte San Giusto, near Fermo; the St. Lucy altarpiece, 1532, in the Pinacoteca Comunale at Iesi (PL. 211); and the altarpiece *The Madonna of the Rosary*, 1539, in S. Domenico at Cingoli.

In 1538, while in Ancona, Lotto started an account book, which he was to keep meticulously up to date almost to the day of his death. This book is vital both for the biographical information it contains and for its accurate recording of the artist's works.

From 1540 to 1542 Lotto lived in Venice in the house of his nephew, Mario d'Armano. Then, at some time during the next three years, he moved to Treviso and stayed with a friend, Giovanni del Saon. However, from 1545 to 1549 he was in

Venice again, because in Treviso he could not earn enough by his art to support himself. But, always restless, he changed his quarters there at least five times. During this period, on Mar. 5, 1548, he drew up a will in which, nullifying a previous donation to Giovanni del Saon, he bequeathed all his possessions to charity and appointed as executors the monks of the Church of SS. Giovanni e Paolo, in Venice, for whom he had painted in 1542 the altarpiece *St. Antoninus of Florence Giving Alms* (PL. 213). In his will Lotto described himself as "alone, without loyal help, and quite troubled of mind."

In the late spring of 1549 he was ready to leave Venice and go once more to the Marches, having been commissioned to execute the altarpiece *The Assumption* for the Church of S. Francesco delle Scale in Ancona (now Pin. Comunale). Before leaving Venice he entrusted a number of paintings and cameos to Jacopo Sansovino in the hope that the latter would sell them for him. (Later Sansovino returned them all to Lotto, unsold.)

From 1549 to 1552 the artist lived in Ancona. In 1550 he tried to put up 30 of his pictures for a raffle, but he succeeded in disposing of only 7. Finally, since he was still besieged by poverty and wished to avoid wandering in his old age, he managed to obtain admission (Aug. 30, 1552) to the Sanctuary of the Holy House of Loreto. On Sept. 8, 1554, he became an Oblate of the Blessed Virgin, turning over all his property and pledging his works to the Sanctuary. The last entry in his account book is dated Sept. 1, 1556, and shortly afterward he died in Loreto.

Lotto's life, restless and vagabond, ended in solitude, poverty, and oblivion, but his artistic creations, rich in fascinating accents of intense modernity, rank among the finest and most original of the Italian 16th century.

Documents do not indicate who was Lotto's teacher. A wanderer even in his youth, he probably never stayed long in any one shop, preferring — curious and impressionable as he was — to explore the more novel and experimental trends of his times. Pioneering in modern Lotto scholarship with his first monograph of 1895, Berenson traced the artist's antecedents to Alvise Vivarini. Later, however, Berenson himself was to revise his initial theory, when he recognized that some pictures he had attributed to Alvise were actually the work of Giovanni Bellini (for example, the beautiful *S. Giustina*; Milan, Coll. Bagatti Valsecchi). Today there is no longer any doubt that the beginnings of Lotto's art are rooted in Bellini, even if they preserve accents derived from Antonello da Messina and an integrity of form rather reminiscent — except for the vibration of cold coruscating lights, so typical of Lotto — of the finished modeling of, for instance, Cima da Conegliano. Also, Jacopo de' Barbari once was considered as a link to explain the German elements which, from the beginning, were conspicuous in Lotto's painting. But this particular hypothesis was discredited when Jacopo's *œuvre* was stripped of the major works once attributed to him. It is far more probable that the young Lotto turned his attention directly to Dürer when the latter was in Venice in 1505–06. With Dürer's paintings of that time the early works of Lotto show remarkable affinities.

Luigi Coletti has advanced still another theory that removes Lotto's early formation from the Venetian influence altogether. On the basis of a sentence in the document commissioning the Recanati polyptych ("de melioribus picturis que sunt iste que inspiciuntur, facte in juventute vel potius in adolescentia sua"), Coletti reached the conclusion that Lotto must have lived in the Marches when very young and there developed in the milieu of Melozzo da Forlì and Luca Signorelli. This thesis can hardly be sustained, since Venetian elements are by far the more prevalent in Lotto's earliest works, even in the two heralds of the fresco decoration around the tomb of Agostino Onigo (Church of S. Nicolò in Treviso), on which Coletti especially based his hypothesis.

The works dated and signed by Lotto in his early years are the *Virgin and Child with St. Peter Martyr and the Infant St. John*, 1503 (Naples, Museo di Capodimonte), clearly under Bellini's influence; the *Portrait of Bishop Bernardo de' Rossi*, 1505 (PL. 207); *The Assumption*, 1506, in S. Maria Assunta at Asolo (but not the *Pietà* above, nor the landscape in the predella, both of which are part of the frame and the work of a modest craftsman); and the *St. Jerome in the Wilderness*, also 1506, in the Louvre. The altarpiece in the parish church at Santa Cristina al Tivarone (XII, PL. 72) is documented and can also be dated 1505–06. To the same period should be attributed also the heralds of the Onigo tomb, which (despite contrary opinions) certainly appear, in their daring and fresh conception, to be by Lotto; the Bachofen *Madonna* in the Kunstmuseum, Basel (though close to the style of Pennacchi, its quality alone justifies its attribution to Lotto's early period); the *Head of a Youth* in the Accademia Carrara at Bergamo (but not the *Portrait of a Man with a Red Cap* of the Museo Correr in Venice); and the portrait bust of a woman in the Musée des Beaux-Arts at Dijon, strongly marked with Dürer's characteristics.

A chronological parallel can be drawn, almost date by date, between this group of early pictures by Lotto and the works of Giorgione before he had arrived at his "grand manner," and a correct reading of the date in the *St. Jerome* of the Louvre (1506 instead of 1500) has placed Lotto in proper sequence within the development of Venetian painting. The Santa Cristina altarpiece is just about contemporary with Giorgione's altarpiece at Castelfranco Veneto (VI, PLS. 185, 188); the *St. Jerome* with the *Tempest* (VI, PLS. 186, 187); *Bishop Bernardo de' Rossi* with the so-called "Laura" (VI, PL. 194) of the Kunsthistorisches Museum in Vienna. But the two painters, alike in the distinctly modern qualities of their sensibility, otherwise took widely divergent paths. Giorgione's vision, soft and blended in warm enveloping tones, is turned to a contemplation of nature and of enchantment. Lotto's painting, on the other hand, despite the finish and integrity of its forms and the clarity of its cool light, reflects, in its unexpected dislocations and agitated accents, a restless temperament.

The Recanati polyptych (1506–08), although still quite near to the early Venetian works, is painted with a greater freedom; its color is lighter in hue and softened here and there by suffusing shadows. The inspired profile of St. Dominic, raised toward the Virgin, foreshadows the Raphael of a few years later — for example, his portrait of Sigismondo Conti in *The Madonna of Foligno* (IV, PL. 314) — which might indicate that other works (now lost) of Lotto for the Vatican might have influenced Raphael.

To this period of activity in the Marches belong *The Marriage of St. Catherine* (Munich, Alte Pin.); the *Sacra Conversazione* formerly in Kraków (Puslowski Coll.); *The Virgin and Child with Saints* (Rome, Gall. Borghese), strong in German overtones; and the fine *Portrait of a Youth Before a White Damask Curtain* (Vienna, Kunsthist. Mus.).

As documented, Lotto was in Rome in 1509. Exposed to a new, very different milieu, his style emerged completely transformed. Although the strongest influence would appear to have come from Raphael, the nature of Lotto's work brought him more closely into contact with the circle of Peruzzi, Sodoma, Bramantino, and later with Beccafumi, who appears to have been in Rome between 1510 and 1512. This environment, in which elements of totally different origins met, must be recognized as one of the earliest centers of mannerism, and in this center Lotto was an active participant. Certain similarities between Lotto and Sodoma and between Lotto and Beccafumi probably had their source in these early Roman contacts. Lotto's collaboration with the Peruzzi group probably continued, even after their leaving the Vatican, in the works executed for Agostino Chigi in the Villa Farnesina. Similarities to Lotto are clear in the profound change Peruzzi's style underwent in the frescoes of the Sala di Galatea and the Salone delle Prospettive. Moreover, the origin of the Venetian traits assimilated by Raphael must be found, surely, not only in the work of Sebastiano del Piombo but also, and earlier, in that of Lotto.

After his departure from Rome, Lotto probably went to Tuscany. In the *St. Jerome in the Wilderness* (Rome, Mus. Naz. di Castel Sant'Angelo) and in the *Portrait of a Jeweler*, in a private collection in Switzerland, Umbrian and Tuscan accents are clearly apparent. Roman and Tuscan characteristics

are also predominant in the works executed on Lotto's return to the Marches: *The Entombment of Christ* (PL. 212), dated 1512, and the three pictures at Recanati (the *St. James the Greater* in S. Maria sopra Mercanti, the *St. Vincent Ferrar* in the Church of S. Domenico, and the *Transfiguration* in the Pin. Civ.); and the two predellas, one of *The Assumption* (Milan, Brera), the other of *Christ Leading the Apostles to Mount Tabor* (Leningrad, The Hermitage).

After his arrival in Lombardy, Lotto was initially attracted to the Leonardesque painters and to Leonardo himself (here, perhaps, are the roots of Lotto's stylistic affinities with the early Correggio). He found in their works elements not unlike those with which he had been familiar in central Italy. Subsequently he was to enter even more deeply the mainstream of the Lombard school. The great local tradition of fresco painting introduced him to a more epic and narrative treatment, with origins in a popular "folk" background.

To this period belong the three large altarpieces in Bergamo: one (1516) in the Church of S. Bartolomeo (predella now in the Accademia Carrara); another (1521) in the Church of S. Bernardino (PL. 210); and the third (1521) in the Church of Sto Spirito. All these sacred compositions are accented by pathetic, fantastic, or worldly touches. *Susanna and the Elders* (1517), in Florence (PL. 209), and *Christ Taking Leave of His Mother* (1521), in the Staatliche Museen of Berlin, are also of this phase. The *Mystical Marriage of St. Catherine* (1523) in the Accademia Carrara in Bergamo and another *Mystical Marriage of St. Catherine* (1524), in the Galleria Nazionale in Rome, are both rich in exquisite psychological insights. This period also includes a fine group of portraits: *Agostino and Niccolò della Torre* (1515) in the National Gallery, London; the *Man with a Rosary* in the Hage Collection, Nivaa (near Copenhagen), suggesting Holbein, although in fact predating him; *The Prothonotary Apostolic Giuliano* in the National Gallery, London; *Micer Marsilio and His Wife* (1523) in the Prado, Madrid; *Lucina Brembate* in the Accademia Carrara, Bergamo; the *Young Man in His Study* (XI, PL. 224) in the Accademia, Venice; the *Youth* in the Castello Sforzesco, Milan; and others.

Also related to this phase are the frescoes (1524) in the chapel of Villa Suardi at Trescore with the legends of St. Clare (PL. 209) and St. Barbara. The St. Barbara subject is pictured in a panoramic setting wherein the saint travels from chapel to chapel on her road to martyrdom. Like those on a Sacro Monte, each stop corresponds to a stage of her own trial and final martyrdom. Before 1524 Lotto had probably visited the Sacro Monte at Varallo and seen Gaudenzio Ferrari's pictures. The frescoes in the Church of S. Giorgio at Credaro and those in the Church of S. Michele al Pozzo Bianco in Bergamo are from 1525; both show, together with a reappearance of German traits, a stylistic kinship with the art of Gaudenzio Ferrari (ca. 1470–1546). The cartoons for the imaginative inlay of the choir stalls of S. Maria Maggiore in Bergamo, with Biblical scenes and ornamental details in an almost surrealistic manner, can be dated between 1523 and 1530; Lotto sent the last few cartoons from Venice. To this period belong the *Sacra Conversazione* of the Kunsthistorisches Museum in Vienna; the *Adoration of the Shepherds* in the Pinacoteca Civica Tosio Martinengo in Brescia; the altarpiece *The Madonna Enthroned with SS. Jerome and Joseph* (1526) in the Pinacoteca Comunale at Iesi; the *Assumption* (1527) in the Church of S. Maria Assunta at Celana; and the polyptych in the Church of SS. Vincenzo e Alessandro at Ponteranica. The succession of fine portraits was uninterrupted, even after Lotto's return to Venice: the *Dominican Steward* (1526) of the Museo Civico at Treviso; *Bishop Tommaso Negri* (1527) in the monastery of Poljud at Split, Yugoslavia; and *Andrea Odoni* (PL. 208). This last, were it not for the date, 1527, and Lotto's signature, would seem to be a work from later in the 16th century because of its pictorial boldness and the highlighted sculptures.

In Venice, after so long an absence, Lotto found a world much changed from the one in which he had so actively participated in his youth during the years 1500–06. This world had evolved a harmonious artistic culture under the leadership of Titian during the time that Lotto had wandered throughout Italy, alert and receptive to varied experiences and schools. He was the first of the great Venetians to be attracted by central Italy and Rome. Lotto was also one of the first to feel the ferment of mannerism, as noted above, and to contribute importantly to its development. His style cannot specifically be contained within any one school, because he always strove for highly personal solutions, at times almost disconcerting in their modernity. He showed a capricious and restless inclination to render his subjects in their least normal and conventional aspects, but with a profound insight into emotional states.

During these Venice years Lotto painted only one altarpiece, *St. Nicholas of Bari in Glory* (1529), in the Church of S. Maria del Carmelo. Too much insistence has been placed on an alleged approach to Titian's manner in this painting; except for a warmth of color in the figures there is no recognizable influence. The panoramic, airy, and remote landscape behind the looming presence of the saints is far from Titianesque; rather it anticipates Dutch 17th-century landscapes.

In 1530 Lotto again worked principally in the Marches, and his style at this point does not appear to have changed much from that of the last Bergamo years. There is hesitancy here and there and a certain unevenness of quality from work to work; yet in the best pictures his touch was, if anything, more free and dramatic, as is evident in the Iesi altarpiece, where the crowd presses around St. Lucy, and in the *Crucifixion* of the Church of S. Maria in Telusiano at Monte San Giusto, and again in the silent, Rembrandt-like intimacy of the St. Lucy predella (PL. 211), where the light, shimmering over mobile shadows, freezes into cool whites and blues.

After his return to Venice, Lotto painted still another masterpiece, *St. Antoninus of Florence Giving Alms*, 1542 (PL. 213), an unusual composition, presented as if from the point of view of the gesticulating crowd of petitioners in the foreground. Although no single figure is more than a head-and-shoulders study, each one, while fused with the group, has the expressive power of an individual portrait. Lotto continued to produce excellent portraits, including examples in the Galleria Borghese, in the Galleria Doria Pamphili, and in the Pinacoteca Capitolina (Conserv.; all Rome); those of *Febo da Brescia, Laura da Pola* (1544), and the *Gentleman with Gloves* in the Brera, Milan; the *Family Group* (*Ser Giovanni della Volta and His Family*; 1547) in the National Gallery in London; and many others. All are rendered with a penetrating knowledge of the sitters' essential psychological traits.

At one point during this period, as recorded in one of Aretino's letters, Titian showed an interest in Lotto when he, too, was acquiring his dramatic, impressionistic late manner. However, the art historians of the Renaissance neglected and belittled Lotto's art. Lodovico Dolce judged his S. Maria del Carmelo altarpiece as a "very remarkable example of bad coloring." Vasari, although less negative, did not commit himself to an opinion of Lotto's work as a whole. In his introduction to the lives of Lotto and Palma Vecchio he was content to acknowledge that the craftsmanship of even one or two pictures by Lotto, despite their small size, was sufficient to justify the admiration of viewers. Even the Venetian historians, C. Ridolfi, M. Boschini, and A. M. Zanetti, do not really give Lotto a position of first rank. More interesting is the evaluation made by G. P. Lomazzo of the artist's Bergamo period. The 18th- and 19th-century studies of F. M. Tassi, D. M. Federici, A. Ricci, L. Crico, and others are strictly erudite in character, and only recently has there been a complete and convincing reevaluation of Lotto's work and of its profoundly human and modern meaning. The Berenson monograph of 1895 marks the beginning of the new studies, including almost all the points that later ones have taken up and developed. Since then Lotto's fame has continued to grow, to such an extent that in the process a correct sense of proportion has, at times, been lost. Signs of impatience with Titian's Olympian grandeur have brought about, by contrast, a perhaps excessive emphasis on the elements of pathos in Lotto's painting.

In his last years in the Sanctuary of the Holy House in Loreto, Lotto withdrew further into his meditations and into a world of his own imagination. His production became

uneven and his creative powers were dimmed. Yet he succeeded in producing one more masterpiece, *The Presentation of Christ in the Temple* (Loreto, Palazzo Apostolico), in which the clear and delicate color ranges evoke once again the imaginative and poetic spirit of the stories of St. Barbara and St. Lucy.

LUCAS VAN LEYDEN. Lucas of Leyden — more correctly, Lucas Hugensz. (son of Hughe) van Leyden — was born in Leiden (Leyden) in 1494, according to the first biographer of Dutch painters, Karel van Mander, and died in the same city in 1533. His name is listed in the register of the Civil Guard of Leiden in 1514, and in 1515 it is found again in a list of crossbowmen, where it remained until 1519. In June, 1521, Lucas van Leyden is known to have met Albrecht Dürer in Antwerp; and Van Mander tells of a voyage in Zeeland in 1527, during which Lucas encountered the painter Jan Gossaert (Mabuse). The date of Lucas's marriage to the daughter of a magistrate of the town, Lijsbet van Boschuysen, can be fixed about 1515. From Van Mander it is established that the artist's father was a painter of Leiden, whose name was already known there in 1480. Another of the sons, Dirck Hugensz., apparently chose the same profession and was a constant source of vexation to his family, because of his disorderly life.

Since there exist engravings by Lucas van Leyden dating from 1508 that demonstrate a fully developed graphic talent, an attempt has recently been made, through a varying interpretation of Van Mander's text, to advance the birth date of their maker to about 1489. Such redating, however, cannot alone explain the rapidity of Lucas's youthful development as an engraver; rather, there is reason to believe that these were the work of a prodigious talent which revealed itself quite early in life.

According to Van Mander, Lucas received his first formal training in the studio of his father and subsequently in that of another painter of Leiden, Cornelis Engelbrechtsz., whose work apparently had little influence on him; the period spent in his father's studio seems to have left a greater impression on the young boy. This can be deduced from a comparison of the work of the young painter with that of the Master of the St. John Panels (Rotterdam, Mus. Boymans–Van Beuningen; Philadelphia, Mus. of Art, Johnson Coll.), recently identified with Lucas's father, Hughe Jacobsz. The same feeling for landscapes painted with very bright colors and a predilection for squat figures, often with coarse and caricatured faces, is present in both. Other influences to which Lucas was exposed, notably the work of Dürer and of Jan Gossaert, although they left some mark on his work, did not add essentially to the first impulses from which his painting sprang.

The abundance of existing graphic works by Lucas van Leyden — with Dürer's, one of the most important *œuvres* of the 16th century — permits us to follow his development very closely, particularly since most of his production is dated. The first dated engraving is from 1508; the last are from 1530. During the last three years of his life, he does not seem to have occupied himself with engraving. Moreover, the wealth of dated graphic works helps to establish a reasonable chronological order for his paintings (only five of which bear dates).

The fact that Lucas made engravings throughout most of his life assuredly indicates a preference for that medium. On the whole, it might be said that the engraver triumphs over the painter, even if his conception of engraving in the youthful work seemed to borrow more from painting than from the engraving heritage of his predecessors. Van Mander also tells us that in his youth Lucas did paintings on glass, and perhaps there is reason to seek in this type of work, consisting mainly in grisaille, the origin of the very fine and tightly spaced strokes in his engravings.

The engraving *Mohammed and the Monk* of 1508 (Bartsch, no. 126), the subject of which was taken from *The Travels of Sir John Mandeville*, constitutes the true beginning of Lucas's engraving, although one can reasonably date prior to this work (in which the landscape is already done with remarkable finesse) a small series of engravings less well composed, yet nonetheless engraved with an extremely fine point. Examples of these very early efforts include *Adam and Eve* (B.7), *St. Christopher* (B.108), and *Two Pilgrims* (B.149), and possibly even the *Resurrection of Lazarus* (B.42) and *Abraham Repudiating Hagar* (B.17), plates from a larger series that belong among the greatest rarities of print collecting.

By 1509, Lucas showed proof of marked progress, in the medallionlike so-called "round Passion" series (B.57–65; with two replicas, B.66–67), notably in his concept of space and his adaptation to the round format. Still, he did not achieve such fortunate solutions in this series as he had in certain isolated works of 1508, namely, *Susanna and the Elders* (B.33), the landscape of which was copied by Marcantonio Raimondi, and *David Playing before Saul* (B.27). Perhaps more than any, this last-named print furnishes convincing evidence of an observational gift already highly developed, surpassing by far the efforts of his predecessors. None of his paintings equals the standard of these two engravings.

Among Lucas's painted works, on the other hand, there is little that can be attributed to the period of his early youth, without entering the realm of speculation. A small altarpiece, the *Adoration of the Magi* in Philadelphia (Merion, Barnes Foundation), would be virtually the only safe conjecture. However, there might be added to this a scene of an amorous couple with an old woman (Howett Coll.), a *Story of Job* (Richmond, Surrey, Coll. Viscount Lee), and an *Adoration of the Magi*, known through three copies (e.g., Karlsruhe, Staat. Kunsthalle) that could well be the work of the master himself. *The Temptation of St. Anthony* (Brussels, Mus. Roy. des B.A.), dated 1511, despite the fact that it is signed with an "L," seems to have been executed by a hand other than that of the engraver of the round Passion series.

In 1510 Lucas began to create his real masterpieces of engraving, for in that year he completed *The Milkmaid* (B.158; PL. 216), the great *Ecce Homo* (B.71), and *The Return of the Prodigal Son* (B.78), all remarkable for the sureness with which he rendered both individual figures and groupings. Until then, Lucas seems to have resorted to few older models, except for borrowings from Dürer evident in the round Passion scenes.

His compositions, though of great simplicity, lacked nothing in expressive force.

The acquaintance with Dürer's art and with that of Antwerp inspired in Lucas a desire to rival the achievements of the great art centers. He began to modify his compositional schemes, thereafter crowding his prints with figures and closing off the beautiful perspectives of his early work with architectural motifs. This new tendency became noticeable in the work of the years 1512 and 1513, and the large *Adoration of the Magi* (B.37) was the unsatisfying result of the change in approach.

Fortunately Lucas succeeded in freeing himself of the heaviness manifest in his work of that period, for a return to his former finesse of draftsmanship is evident in the years 1517 and 1518, when he created the two admirable prints *Esther before Ahasuerus* (B.31) and *Christ Tempted by the Devil* (B.41). In 1519, *The Dance of the Magdalen* (B.122) marked the reemergence of the ample composition with many figures arranged in small, dispersed groups. These tranquil figures contrast strongly with the agitated hunt scene in the background. In this device he sought a harmony between vertical elements and the frieze of figures, a composition he later learned to develop more ingeniously in his paintings.

Nevertheless, once oriented in the direction of the major currents of art, Lucas could no longer liberate himself completely from a tendency toward mannerism. Certain pieces from the Passion series of 1521 (B.43–56), inspired by Dürer, suffer from a misuse of mannerist effects; but although the art of the great German master made a strong impression on Lucas, it is interesting to follow his departures from an idea taken from Dürer, for example, in the portrait of the emperor Maximilian (B.172). Inspired by a wood engraving of Dürer, Lucas transformed it into a creation entirely his own by using a combination of aqua fortis and engraving. In the process, he evolved a copperplate technique, known later in France as "taille douce," which no engraver before had used with such effectiveness and bold assurance.

Van Mander's account of Lucas's meeting with Gossaert promotes the likelihood of another strong influence on the artist, already apparent in 1523. In that year he executed *The Poet Vergil Suspended in a Basket* (B.136; PL. 216), shortly after the Madonnas of 1523 (B.82, B.84), which again reveal his great admiration for Dürer. From that time on, Lucas sought after a monumentality that produced lifeless and indifferent results. His last engravings, peopled with distorted figures, are reminiscent of the art of Gossaert and Raimondi and retain some value as testimony to a new art; but in them one seeks in vain the spontaneity of the works of his youth. This development is more pronounced in the engravings, destined for wider dissemination, than in Lucas's paintings. In these, for the most part, he conserved an intimate quality and sacrificed it only in the great altarpieces. Even in his first attempts at painting, there is discernible a predilection for narrative motifs, a tendency that made him a genre painter par excellence. This inclination can be noted in *The Chess Players* (V, PL. 292), a painting dating from about 1508; about 1510 there followed two religious paintings, *Susanna before the Judges* (PL. 215) and an episode from the story of Joseph (Rotterdam, Mus. Boymans–Van Beuningen), in which Lucas introduced genre motifs into religious subjects. In this aspect can be recognized the precursor of Rembrandt, whom he equals as a sensitive observer of fact.

Still another bond between Lucas and his great compatriot of the 17th century is the spontaneous manner in which he could render his own features. The *Self-portrait* (V, PL. 299), dating from about 1508, might also be compared with the self-portraits that Dürer executed in his youth. It shows the same avidity for capturing personal traits with astonishing objectivity. Moreover, in it Lucas excels the portraiture of his contemporaries with a liberty of execution not found even in his own later work. Two other portraits — one painted about 1510 (Lugano, Thyssen-Bornemisza Coll.), in which the features of Lucas's father are purportedly recognizable, and another that dates from about 1521 (PL. 214) — can be attributed to him. The latter work is very studied. There are many similarities with a series of drawings in black pencil, some of which are dated 1521. The influence of Dürer's portraiture is quite apparent, and it would seem a reasonable supposition that Lucas sought to emulate the German master after his meeting with him in Antwerp in 1521.

Other paintings indicate little of this influence deriving from Dürer. Certain traces remain, of course, particularly after Lucas's visit to Antwerp, as in the *Virgin and Child, the Magdalen, and a Donor* (PL. 217), a diptych of 1522, in which the somewhat pedantic and dry execution betrays excessive preoccupation with draftsmanship. More evidence of Dürer's ideas is found in individual figures of Lucas's masterpiece, the *Last Judgment* (PL. 218; V, PL. 292), commissioned in 1526. The farther one goes beyond the significant year 1521 in examining his production, the more this influence generally tends to disappear. In Lucas's last work, *The Curing of the Blind Man of Jericho* (Leningrad, The Hermitage; in Van Mander's time in the collection of the engraver Hendrik Goltzius), an altarpiece of 1531, the Dürer inspiration has given way to a more highly developed conception, in which the artist succeeded in reuniting the vivid qualities of his great engravings with a simplicity of composition anticipating the Renaissance style of Jan van Scorel (q.v.).

Already apparent in the *Last Judgment*, the accomplished distribution of figures within convincing space, with an accurate sense of depth, may cause one to forget that Lucas van Leyden began his career in a north European milieu still virtually medieval. (Another version of the same subject in the Museum of the New-York Historical Society is by some attributed to Lucas.) In tracing the development of the painter, an important place must be given to *Moses Striking Water from the Rock* (Boston, Mus. of Fine Arts), dated 1527. Here Lucas, for the first time, placed large figures in the foreground in such a way that they dominated the composition. His imitators did not succeed fully in attempts to copy this disposition of space. Certain among them — for example, Pieter Cornelisz. (called Kunst), one of the sons of Engelbrechtsz. — imitated his style with such proficiency that for a long time the hand of Lucas himself was thought to be evident in paintings attributed to the younger artist; the best known of these deceptive paintings is the *Sermon in the Temple* (Amsterdam, Rijksmus.).

The true Lucas — engraver in his paintings and painter in his engravings, as M. J. Friedländer has remarked — can be studied in a particularly meaningful way in a painting lately added to the collections of the Rijksmuseum, *The Worship of the Golden Calf* (V, PL. 292), which dates from his finest period. The sequence of movement established in this painting is accomplished so felicitously as to obscure the still medieval form of the altarpiece and the division into three parts, for the painter clearly conceived the work as a unified composition. The figures, and even the colors, can be compared with those of Lotto. Both painters, while largely independent of the past, retained in their new vision something of a strained quality of form, which can simply be characterized as a holdover from the medieval style. This quality was strongly current during the 17th century, when the style of Lucas was imitated in scenes from the Scriptures, in order to add a historical accent to such compositions. In the work of Goltzius, and perhaps more clearly in that of Rembrandt when he returns to Lucas for costumes or architectural accessories, the results of such inspiration are evident.

The activity of Lucas van Leyden was not limited to painting and engraving. He took part in the transformation of Dutch book illustration by introducing new motifs, just as he had given fresh impulse to wood engraving by adapting it to the vigorous strokes of his pencil drawings.

It is difficult to determine whether Lucas designed for stained-glass church windows. Some studies for stained-glass windows found in the Groote Kerk of Gouda may be from his hand (Amsterdam, Rijksmus.). Although their style seems close to that of Lucas, however, one hesitates to attribute them to him without the historical documentation confirming such purely stylistic affinity.

Nevertheless, even if Lucas van Leyden cannot be given a secure place in this last medium, his remaining pursuits are

sufficient testimony to the amazing creative force he exerted during his short life. He dominated his entire generation, yet he did not open strikingly new perspectives. Having begun to practice his art with a powerful and acute perception of reality, he seems gradually to have forgotten his unique mission under the influence of Dürer and Gossaert, to have become preoccupied with sheer technical feats. Furthermore, the great lesson of the Italian Renaissance was unknown to Lucas, and it was not until the next generation, with Jan van Scorel, that Dutch art was to comprehend such new conceptions.

LUTYENS, EDWIN LANDSEER. Architect (b. London, Mar. 29, 1869; d. Jan. 1, 1944). Although a pupil of Sir Ernest George, Lutyens was greatly inspired, initially, by the work of Philip Webb and William Morris. He was given a first commission for a small country house in 1889, and on the strength of this he established a practice. Noticed by the energetic garden designer Gertrude Jekyll and helped greatly by her, Lutyens was also aided in his career by his marriage to a daughter of the Earl of Lytton.

Lutyens soon developed into one of the most talented and resourceful designers of country houses. In the style of Richard Norman Shaw (q.v.) and Webb, his residences have prominent roofs and combine Tudoresque with Georgian motifs (Deanery Gardens, Sonning, Berkshire, 1899–1901; The Orchards, Godalming, Surrey, 1899; Tigbourne Court, Witley, Surrey, 1899; Folly Farm, Sulhampstead, Berkshire, 1905, 1912). These buildings confirmed Lutyens's originality and ability in coordinating forms. Very early, however, he was attracted by classicist tendencies, first of a William-and-Mary kind (Crooksbury House, Surrey, east front, 1899; Hestercombe Orangery, Surrey, 1905), then of a more imposing Neo-Georgian type (Nashdom, Taplow, Buckinghamshire, 1905) and a semi-Palladian, semi-English-baroque "Wrenaissance" (Heathcote, Ilkley, Yorkshire, 1906).

Lutyens shared in full the "folie de grandeur impériale" of the Edwardian period, and it made him the ideal architect of England's last crop of truly spectacular country houses (Lindisfarne Castle, Holy Island, Northumberland, 1903, a restoration, originally built ca. 1500; Castle Drogo, Devon, 1910–30) and, of course, for the master plan and designs for New Delhi. His Viceroy's Residence (ca. 1913) has a genuine monumentality and a sense of grandiose display that Sir Herbert Baker never achieved in his buildings for New Delhi.

In the end, however, Lutyens bogged down in classicism. Despite his extreme care for proportion and the oddly impish details into which his former originality retreated, his later commercial buildings, such as Britannic House in London (after 1920) and his branches for the Midland Bank (1924, etc.), remain outside the main stream of European developments. More genuinely original is an early church of Lutyens, the Anglican St. Jude's in Hampstead Garden Suburb (1909–11), which displays a sense of massing very rare in the ecclesiastical architecture of his time.

Nikolaus PEVSNER

LUXEMBOURG. The modern territory, bounded by Belgium, Germany, and France, takes its name from the city of Luxembourg, which arose about the castle of Lucilinburhuc or Lützelbourg. The original nucleus of the future grand duchy, formed in the 10th century, has survived the major political upheavals of the modern age intact.

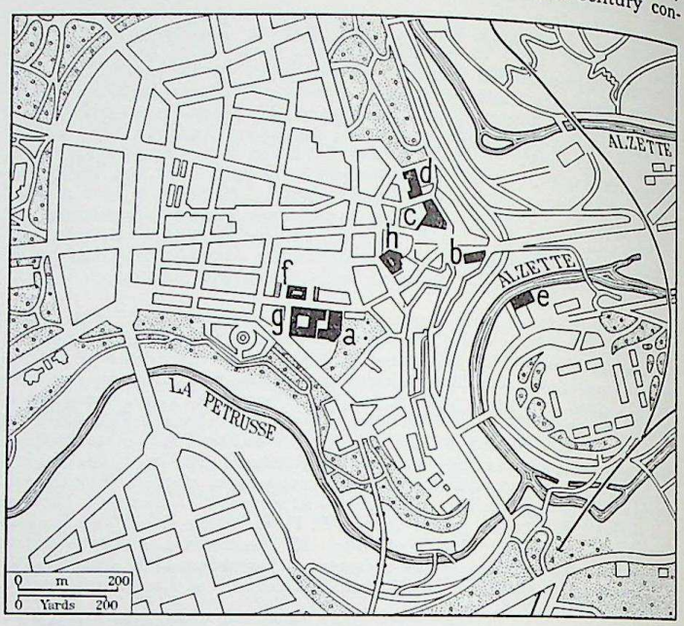
SUMMARY. Cultural and artistic phases (col. 354). Art centers (col. 355).

CULTURAL AND ARTISTIC PHASES. Its limited territorial extent and its geographic position have prevented Luxembourg from evolving autonomous artistic traditions. The oldest traces of life in the area are of the megalithic period, attested by the dolmen near Diekirch. Evidence of prehistoric settlements has been found at Berdorf. The first roads were built at the time of the Gauls, and the Romans laid out their great network of highways between Belgium and the Rhineland along the old Gaulish routes. To the Roman period belong a relief of pagan divinities under the high altar in the church at Berdorf, the castrum of Ricciacum at Dalheim, vestiges of a mosaic pavement at Nennig, the ruins of a 4th-century bridge at Echternach, and the foundations of a pagan temple under the parish church at Christnach. Frankish tombs are found at Dalheim, Schandel, Emmering, and Waldvies. The scant remains do not allow us to recognize a particular cultural physiognomy in the local archaeological finds distinct from those of the adjacent territories.

The Abbey of Echternach, founded in the 7th century, was the center from which Christianity was diffused throughout the region,

Luxembourg, principal centers of historic and artistic interest. *Key*: (1) Modern national boundaries; (2) localities with medieval monuments; (3) localities with Renaissance and baroque monuments.

and with it a new cultural impulse. Echternach was one of the important centers of Carolingian learning and art, especially notable for its illuminated manuscripts. When Luxembourg was incorporated into Lotharingia, it became subject to artistic influences from the sphere of the Holy Roman emperors Otto I, II, and III (late 10th–early 11th cent.) and began to participate, in a modest way, in the artistic life of western Europe in that period. During the feudal epoch, when Luxembourg was exposed to the incursions of her warlike neighbors, many fortresses and castles were built (Luxembourg, Larochette, Wiltz, Brandebourg, Vianden, Beaufort, Bourscheid, Septfontaines, Clervaux); these, though mostly in ruins, continue to form a characteristic feature of the landscape. In the Gothic period, French influence was preponderant, particularly in styles of architecture and sculpture. The pronounced Burgundian style of some sculpture (such as the Holy Sepulcher in the church at Septfontaines) can be attributed to the annexation of Luxembourg by the duchy of Burgundy in the mid-15th century. Most of the churches and castles dating from this period have been extensively remodeled, however, and retain slight traces of their original structures. The best example of the architecture of this period is found at Vianden.



Of the Italian Renaissance, there are a few late echoes in isolated decorative elements, such as the portal of Notre-Dame in Luxembourg and carved fireplaces in the castles of Erpelding and Beaufort. In the baroque period many new churches were built, others were remodeled, and fortifications were restored. Some pleasant examples of the rococo, in a fusion of German and French styles, are provided by such buildings as the Pavillon and the Orangerie in the park at Echternach, built by the Mungenasts, a family of Tirolese architects. In the 19th century, French influence again came to the fore, and the noteworthy examples of 20th-century architecture reveal the same inspiration. The popular taste has remained a picturesque juxtaposition of Neo-Gothic, rococo, and Art Nouveau. There has been no discernible local tradition in painting, that is, any tendencies originating in or confined to the grand duchy.

Art centers. Luxembourg. The capital of the grand duchy, the city is situated at the junction of several ancient Roman roads. It grew up around the castle built by Count Siegfried on the Rocher du Bouc, when at the end of the 10th century the nucleus of the present city was founded, probably on the initiative of Siegfried. By the reign of King Wenceslaus IV of Bohemia (1361–1419), who was also Duke of Luxembourg, the city had already achieved importance. Remains of the fortifications, casements, subterranean chambers, and the towers of the city walls of 1393 still exist. In 1554 much of the city was destroyed by the explosion of a powder magazine. It was then rebuilt on a plan conceived by Sebastiaan van Noyen, a scheme incorporating what remained of the old city and retaining the ancient fortifications that over the centuries had defended the city against frequent assaults. Additional fortifications built by Sebastien Vauban in 1684 enhanced the military importance and picturesque character of the city, which remained a citadel between segments of the French and German borders until well into the 19th century. In this century the city has extended its boundaries and has been appreciably modernized. Because of great differences in the level of the terrain (resulting in a variety of panoramas), one of the prominent features of the city is the large number of bridges (64), some of very daring construction. Among the most notable is the Adolphe Bridge, completed in 1903 by the French architect Paul Séjourné.

The Cathedral of Notre-Dame, formerly dedicated to St. Nicholas, was largely built by the brothers Du Blocq, Jesuit architects, between 1613 and 1618, in the prevailing style of the southern Netherlands. Gothic elements are found in the towers flanking the choir, in the vaulting, and in the chapels radiating from the apse. The portal is in Renaissance style, and the interior contains a baroque ambo. The choir was entirely rebuilt and decorated with paintings, sculpture, and stained glass in 1935. St-Michel, a Dominican chapel built in the early 15th century on the ruins of a 10th-century church, has a baroque tower and decorations. The high altar has a frontal, depicting the Assumption, by the Flemish painter Caspar de Crayer (1584–1669). St-Jean Baptiste (1688) is the burial church of the dukes of Luxembourg. The Chapel of St-Quirin, a very ancient structure, is carved from the native rock and has Gallo-Roman foundations. The altar is decorated with crude Romanesque sculpture, and the façade is 14th-century Gothic.

The Grand Ducal Palace was built from designs by the architect Adam Roberti, over the ruins of the old Hôtel de Ville. It reflects the taste for the ornate of the ruling governor, Count Peter Ernst Mansfeld (1517–1604), especially in the Hispano-Moresque façade decorated with relief arabesques. Enlarged and remodeled first in the 18th century, it was again enlarged in the 19th century by Gédéon Bordiau of Brussels. The interior of the Palais de Justice, formerly the seat of the government, dates from the mid-16th-century con-

Luxembourg, plan of the center of the city: (*a*) Notre-Dame; (*b*) St-Michel; (*c*) Musée de l'Etat; (*d*) Palais de Justice; (*e*) St-Jean Baptiste; (*f*) Hôtel de Ville; (*g*) Athénée Bibliothèque; (*h*) Grand Ducal Palace.

struction, but the neoclassic façade was added in the late 19th century. The palace that houses the Ministry of Internal and Foreign Affairs was built in 1751 over the ancient refuge of St. Maximin of Trier (Trèves). The interior has interesting decorations in the style of Louis XV. Among the noteworthy residences are the "Ancienne Crèche," a picturesque 16th-century house with a 17th-century wing (restored 1956); the Renaissance Maison de Raville; and the medieval "Maison sous les Piliers" (remodeled 1685). Interesting monuments were erected to King William II of the Netherlands, by Antonin Mercié (1884); to Amélie of Saxe-Weimar, by Charles Pêtre, and to the Luxembourg national poets, Dicks and Lentz, by Federspiel (1903).

The Musée de l'Etat (also known as the Musée Pescatore, from the donor of the nucleus of the collection) has several collections: Romanesque reliefs from various churches (carved altar frontals from Rosport); Flemish, German, and Italian paintings; and glass, medals, and silver.

Echternach. On the right bank of the Sauer River in a region once under Roman rule (evidenced by a 4th-century bridge), Echternach owes its fame to the abbey founded in the late 7th century by St. Irmina (d. 698) and placed in the charge of St. Willibrord, an English missionary who converted the Frisians. An important center of diffusion for the art of illumination, the monastery produced masterpieces such as the Codex Aureus Epternacensis (1035–40; Nürnberg, Germanisches Nat. Mus.) and the Codex Caesareus (ca. 1050; Uppsala, Univ. Lib., Cod. 93), containing the Gospel according to St. Matthew. The Church of St. Willibrord was rebuilt in 1028, after a fire that had left intact only the crypt of the original church (dated 698); this had been under the Carolingian church, which had choirs at both ends. The crypt, where the sarcophagus of the dedicatory saint rests and where outline paintings of the 12th century have been revealed, was spared by the bombardments that

destroyed the Romanesque church in World War II. It lies under the present-day church, which accurately reproduces the previous Romanesque structure, even the Gothic additions in the ogival vaulting. The Corinthian capitals of 1678 also survived the bombing. The parish church of SS. Pierre et Paul, built in Romanesque style in 1220, with a pentagonal choir, was remodeled during the Gothic period and again in the early 18th century.

The monastery underwent major rebuilding in 1732. Later additions within the great park include the Orangerie (1750), designed by the Tirolese Sigmund Mungenast, and the elegant rococo Pavillon (1761–65) by Simon and Paul Mungenast. The Hôtel de Ville (1520–30; restored 1897) has Gothic porticoes and arcades decorated with statues.

Esch-sur-Alzette. This model workers' city, an important example of urban planning based on contemporary industrial criteria, was built in 1952 from designs by the architects Robert Lentz and Semp Michels.

Bibliog. R. Lentz and S. Michels, Cité ouvrière, Arch. d'aujourd'hui, XXIII, 45, 1952, p. 54.

Vianden. An old feudal town on the Our River, dominated by a partly ruined castle (rebuilt several times), Vianden was the seat of a dynasty whose origins date from the 11th century. Among the vestiges of the castle it is still possible to distinguish details of the Hall of the Knights, a Byzantine chamber with trilobed windows decorated with Romanesque capitals. The two-storied decagonal chapel dates from the 13th century, the donjon from the 14th. The church and convent of the Trinité, structures of the Gothic period that have been remodeled, contain the tombs of Marguerite of Spannheim (1400) and Henry of Nassau (1589). The Hôtel de Ville was built in 1579. There is a regional museum of folk art.

LYSIPPOS (Λύσιππος, Lysippus). Greek sculptor of the 4th century B.C., a native of Sikyon. His father's name was probably either Lysippos or Lysistratos, as indicated by a recently discovered inscription at Delphi that preserves the first three letters of the patronymic (Marcadé, 1953, p. 66); his brother Lysistratos was also a sculptor (Pliny the Elder, *Naturalis historia*, xxxv, 153). Though the dates of his birth and death are not specifically established, it is known that he lived to a very old age (*Anthologia Palatina*, xvi, 332) and that his output was exceptionally prolific (Pliny, op. cit., xxxiv, 37). The following events are important for establishing his dates. Lysippos was the favorite court sculptor of Alexander the Great (ibid., xxxiv, 51, 63), whom he outlived by many years, and was employed by Kassandros no earlier than 316 B.C. (Athenaeus, *The Deipnosophists*, xi, 784). An inscription found in Rome, now lost (Löwy, *IGB*, m:o 487, p. 318), seems to indicate that Lysippos made a portrait of Seleukos I Nikator after the latter had assumed the title of king in 306 B.C. He was still active, therefore, in the last decade of the 4th century, but there is no reason to believe that he survived the turn of the century. The above-mentioned inscription at Delphi also refers to a statue of the Theban general Pelopidas, executed by Lysippos no later than 363 B.C. and possibly as early as 369 B.C. Such an important commission could hardly have been awarded him before his twenty-fifth year; thus the date of his birth may be placed in the first decade of the 4th century. Most available knowledge of the life, work, achievement, and style of Lysippos is provided by Pliny (op. cit., xxxiv, 37, 51, 61–67). Because of his method of compiling material from earlier literature, Pliny's accounts are sometimes contradictory and confusing. This does not altogether negate their value as source material, but the order in which this material is presented makes it undependable as a basis for biographical reconstruction. Pliny cannot be relied upon in tracing the stylistic development of an artist such as Lysippos, especially since the sculptor's long career spanned the period during which Greek life and art passed from the postclassic to the Hellenistic phase.

Lysippos spent his early years in the conservative milieu of artisans as apprentice to a coppersmith. Contrary to the prevailing custom, he was not trained in the school of a specific artist. Cicero's assertion (*Brutus*, lxxxvi, 296) that Lysippos personally considered the *Doryphoros* of Polykleitos (XI, PL. 189) to be the masterwork he found most instructive illustrates his early conservatism and the heritage he claimed from the classical masters of the 5th century B.C. In apparent contrast stands the endorsement by Lysippos of a famous saying of Eupompos that nature, rather than works of earlier masters, should be imitated. The pronouncements, therefore, must belong to different periods of the artist's life: the first statement indicates artistic idealism; the latter signifies a new spirit of naturalism and a repudiation of earlier models. The two attitudes, however, are not mutually exclusive; they should be interpreted, in the light of Lysippos' stylistic development, as successive expressions of his changing esthetic.

Lysippos often said that other artists represented men as they were, and he, as they appeared to be (Pliny, op. cit., xxxiv, 65). Though this statement is not easily interpreted, it suggests that neither idealism nor naturalism satisfied him as an artistic principle. It can plausibly be understood as a stylistic formula, applicable to a late stage in his life, when he blended human and divine qualities in his portraits of the deified Alexander. These sculptures are well described by such ancient authors as Plutarch and Apuleius and noted in later writings. In this period also Lysippos experimented with the prescribed canon of human proportions, "making the heads smaller than older artists had done, and the bodies slimmer and less muscular, thus increasing the apparent height of his figures" (Pliny, ibid.).

Literary evidence, therefore, seems to support the logical hypothesis that the style of Lysippos underwent a constant development in which at least three different stages are discernible: his early conservative style, the mature style of his middle age, and his late style.

Since no indisputable work of Lysippos now exists, attributions have varied greatly, with little unanimity among scholars in any single case. This disagreement is particularly frustrating because abundant literary reference to his work is available and there is clear evidence of his great influence on his contemporaries and on posterity.

Substantial evidence links to Lysippos the marble figure of Agias (PL. 219) found by the French excavators at Delphi. *Agias* is one of a group of statues dedicated about 332 B.C. by the Thessalian dynast Daochos II, who that year was hieromnemon at Delphi. It is a copy of a bronze statue erected eight years earlier in Pharsalos, the native town of Daochos, as understood from the identical epigrams inscribed on the two bases. The Pharsalos statue is lost, but its epigram mentions Lysippos as the artist. The Delphian replica can thus be considered a reliable representative of Lysippos' work about 340 B.C., showing in the non-Polykleitan stance of the nude athletic figure the definite abandonment of his early style. The slight advance of one foot in an uncompleted step and the figure's gaze in the same direction forsake the self-contained posture of the Polykleitan models and imply the third dimension. The head of Agias is clearly individualized by nervous tension; its modeling is terse and somewhat dry (cf. Pliny's description, "corpora sicciora"), though vibrant and effective. His limbs are rather slim and his head is somewhat small, but there is no extreme proportional change.

The figure of Agelaos in the same group is so similar in style to that of Agias that it must be the work of the same master. The formulation of the epigram on the plinth associates him

directly with Agias and with Telemachos, an intermediary figure whose epigram also links him in turn to Agias. *Telemachos*, *Agelaos*, and *Agias* should, therefore, serve equally as evidence of Lysippos' style. *Telemachos* (sometimes wrongly identified with a fourth statue of the same group, *Sisyphos II*) is obviously contemporary with the two others but seems to display a recurrence of the early style of Lysippos. This assumption is substantiated by the Praxitelean stance of Telemachos, leaning on a herm, his softer, more conservative modeling, and his more solid proportions.

Another athletic victory statue, to which Pliny refers (op. cit., xxxiv, 62), is the famous *Apoxyomenos* (PL. 220), preserved in the Vatican Museums; it is a Roman replica of faithful iconography but mediocre workmanship. In this figure Lysippos' new canon of proportions is fully applied, creating an impression of extreme slenderness. The working of the hair of the *Apoxyomenos* is much more elaborate than in the figures of Agias and Agelaos (cf. Pliny, loc. cit., 65); the right arm is extended forward, while the left is bent in a half circle to meet it at the elbow. Thus, a horizontal plane, enclosed by the two arms, is projected toward the spectator, producing the first truly three-dimensional sculpture in Greek art, a result heightened by the figure's stance and the direction of its gaze. The *Apoxyomenos* may profitably be compared with the so-called "Ilissos stele" in the National Museum, Athens, executed just before 317 B.C. The nude youth on this stele displays the same spatial principles as the *Apoxyomenos* and was probably created under the influence of contemporary Lysippian works. By inference and internal evidence, therefore, the *Apoxyomenos* should be considered representative of the late style of Lysippos about 320–315 B.C.

A Roman copy in Berlin (Staat. Mus., K 233) of the figure of an athlete should be dated, for stylistic reasons, between the *Apoxyomenos* and the Ilissos stele; its original is commonly attributed to the Lysippian circle. Heads of athletic victory statues, stylistically reminiscent of the figures noted above, are the one in Olympia (E. Curtius and F. Adler, eds., *Olympia: Die Ergebnisse der . . . Ausgrabung*, II, Berlin, 1797, pl. 54, 3–4), that in the Museo Nazionale Romano, Rome (BrBr, text to nos. 717–18), the so-called "Bardini head" in the Museo Bardini, Florence (BrBr, text to nos. 717–18), and the so-called "Fagan head" in the British Museum. The latter is apparently a replica of the head of a statue usually described as Hermes binding on his sandal (PL. 221), which was ascribed to Lysippos by Christodoros (*Anthologia Palatina*, ii), who saw it in Constantinople. It is more likely an athlete loosening his sandal before joining a contest, and the highly three-dimensional pose and proportions conform to Lysippos' style after 320 B.C. The statue, formerly in the Lansdowne Collection, is now in Copenhagen (Ny Carlsberg Glyptotek).

Literary sources indicate that Lysippos created many cult images and other statues of the Olympian gods. Examples of these are the figures of Zeus in Taras, Sikyon, Argos, and Megara; of Poseidon in the sanctuary of Isthmia near Corinth; of Helios in his quadriga, in Rhodes; of Eros in Thespiai and on the Akrokorinthos; and of Kairos in Olympia. Some of these figures can, no doubt, be vaguely traced through later adaptations, particularly in small bronzes, but none of the surviving specimens presents a reliable picture of this important part of the artist's work. It has been plausibly suggested that the head of Zeus from Otricoli ultimately reflects a Lysippian archetype. The iconography of the Poseidon statue in the Vatican Museums generally corresponds to a Lysippian scheme, but it is an insufficient basis for stylistic comparisons.

Lysippos also frequently portrayed the figure of Herakles. Among such originals were the statues in Taras and Sikyon; the famous *Herakles Epitrapezios*, a seated statue which accompanied Alexander the Great on his campaigns; a Herakles without armor; and a complete group of the Twelve Labors of Herakles erected in Alyzia. Several attempts have been made to trace the lost archetypes of these statues in the great mass of Hellenistic and Roman figures of Herakles which still exist, but such a task is difficult and hazardous and returns only indefinite results. The bronze group of Herakles capturing a deer (PL. 222) in Palermo is commonly attributed to Lysippos. The minuscule mint mark on a tetradrachma of Sikyon, struck near the end of the 4th century B.C. [E. T. Newell and S. P. Noe, *The Alexander Coinage of Sikyon* (*Numismatic Studies, VI*), New York, 1950, p. 28 and pl. 18:27.2] represents Herakles resting on his club, an image in general accord with the iconography of the Farnese *Herakles* in Naples (PL. 226). That statue was executed in the period of the Roman Empire by the Greek sculptor Glykon and is thought to be based ultimately on a Lysippian prototype. The Sikyonian coin renders likely the adaptation of the Farnese *Herakles* from the statue by Lysippos in Sikyon, which was probably erected in the last quarter of the 4th century. Thus, the tragic or weary Herakles is ultimately Lysippos' creation.

Lysippos made many portraits of Alexander the Great, beginning when Alexander was only a boy ("a pueritia eius orsus," Pliny, op. cit., xxxiv, 63). There is reason to believe that these portraits revealed the development of both men during the more than twenty years of their association; the development probably culminated in the heroic portrayal of the features and character of Alexander upon which Plutarch and others commented (*Vita Alexandri*, iv, 1, and *De Alexandri Magni fortuna*, ii, 2). This type is best represented by such portrait heads as that in the Musée d'Art et d'Histoire, Geneva (Johnson, 1927, pl. 45) and is reflected in such Hellenistic adaptations as that in the Museo Barracco, Rome. The inscribed herm in the Louvre from the Azara Collection (PL. 224) is badly worn and of mediocre quality but may well be modeled on a somewhat earlier work of the late 330s B.C. Lysippos made a famous portrait of Alexander with a lance, which might be represented by the small, corroded bronze statuette in the Louvre (Johnson, 1927, pl. 47). Its posture and style are Lysippian, recalling by its heroic nudity and moving stance the figure of Agelaos in the Daochos group at Delphi, and its iconography is clearly that of Alexander, somewhat reminiscent of the "Azara herm."

Alexander's representation in the guise of Herakles on his coinage and on that of his immediate successors is also noteworthy. Good reason exists for the hypothesis that it is based on an original official portrait much like the 4th-century head in the Museum of Fine Arts, Boston (Sjöqvist, 1953, p. 30). This type of portraiture should be dated somewhat before the Alexander with the lance.

As indicated by H. P. L'Orange (*Apotheosis in Ancient Portraiture*, Oslo, Cambridge, Mass., 1947), the creative imagination of Lysippos solved the problem of rendering the features of a deified man, and his solution was perpetuated in modified form throughout the Hellenistic, Roman, and medieval periods.

Lysippos also created a posthumous portrait of Socrates erected in Athens under Lykourgos' administration. Despite recent objections, F. Poulsen's brilliant reconstruction of the work should be accepted (*From the Collections of the Ny Carlsberg Glyptotek*, I, 1931, p. 31 ff., and II, 1938, p. 169 ff.). His combination of the head in the Louvre (ArndtBr, nos. 1038–39) with a seated statue in Copenhagen (PL. 223; ArndtBr, nos. 1126–27) provides a new insight into the art of Lysippos. As a composition it is filled with quiet dynamism. Its drapery is simple and effective in style and is rendered with many strikingly realistic features, as is the aged body. Equally important is the subtle and convincing interpretation of the sublime genius beneath the ugly features of Socrates' face.

On the basis of the preceding identification there is good reason to attribute also to Lysippos or his circle the so-called "Seated Poet" in the Ny Carlsberg Glyptotek, Copenhagen (BrBr, no. 477), the group of Seilenos with the infant Dionysos in the Louvre (PL. 225; BrBr, no. 64), and perhaps the *Marsyas* in the Galleria Borghese (Rome; BrBr, no. 435).

Through his own work and that of his numerous followers and pupils, Lysippos introduced into the history of Greek sculpture a new stage that matured in the Hellenistic period. Yet he should also be considered the last of the great sculptors in the 4th-century tradition. It is thus the dual role of Lysippos both as precursor and conserver which establishes his unique position in the history of ancient art.

WORKS (lost, known from copies or from sources). *Zeus* with the thunderbolt, colossal standing statue, in the agora in Taras. – *Zeus*, probably standing statue, in the agora in Sikyon. – *Zeus Nemeios*, standing, in the agora in Argos. – *Zeus* of Megara, in a temple. – *Muses*, in Megara. – *Poseidon*, in or near Corinth (possibly identifiable with the *Poseidon* in Pausanias, *Description of Greece*, II, i, 7, 9), with the Dioskouroi in relief on the base. – *Dionysos*, on Mount Helikon (possibly identifiable as the bronze *Dionysos* mentioned by Lucian, *Zeus tragoedus*, 12). – *Helios* in a quadriga, in Rhodes. – *Eros*, at Thespiai in Boeotia (PL. 222), mentioned by Pausanias. – *Eros*, in Myndos, then perhaps in the Lauseion in Constantinople, destroyed by fire in A.D. 476. – *Kairos* standing on an astragal, with winged feet and holding a razor, perhaps in Olympia (Lippold), rather than in Sikyon (Kallistratos); later taken to the Lauseion in Constantinople. – *Satyros*, in Athens. – *Herakles*, in the agora in Sikyon. – *Herakles* seated on a basket on which was spread the lion skin: colossal statue on the acropolis of Taras (Bieber, 1955, p. 35; probably between 332 and 326 B.C.), then in Rome (209 B.C.), and in Constantinople (A.D. 325), first in the Basilica there, then in the Hippodrome; destroyed by the Crusaders (1204). – *Herakles Epitrapezios*, seated on a rock, over which was placed the lion skin, and bearing a cup in the right hand and a club in the left, used as a table ornament. – Seated *Herakles*, weary: the god vanquished and disarmed by Eros? – *The Labors of Herakles*, in the Temple of Herakles in Alyzia in Acarnania, then in Rome. – *Hermes* binding on his sandal, attributed to Lysippos by Christodoros (*Anthologia Palatina*, ii; PL. 221). – Portraits of Alexander the Great: Alexander as a child, a statue Nero had gilded. – Alexander with the lance, turning to the left and gazing upward. – Alexander on horseback, over life-size; Caesar replaced Alexander's head with his own portrait and dedicated the statue in the Forum before the Temple of Venus Genetrix. – Group of Alexander menaced by a lion, aided by Krateros, in Delphi (320–315 B.C.), in collaboration with Leochares, erected by the son of Krateros. – Alexander's companions, a series of 25 portrait statues dedicated in Dion for the victory of Granikos (334 B.C.); taken to the Portico of Octavia in Rome in 168 B.C. – *Hephaistion*, Alexander's friend, also attributed to Polykleitos the Younger (Pliny). – Portrait of Seleukos I Nikator; the signed marble base is known through a copy (now lost) in Rome in the 15th century. – *Pythes*, son of Andromachos of Abdera: two athletic statues in Olympia. – *Socrates*, in the Pompeion in Athens, created after the philosopher's death (335–330 B.C.). – *Praxilla*, the poetess, probably in Sikyon, identifiable with the following work. – Drunken flute girl (*temulenta tibicina*). – *Aisopos* (Aesop), shown with the Seven Sages, in Delphi. – *Troilos*, son of Alkinoos of Elis, Olympic victor with biga and quadriga; the base, bearing a metrical inscription, has been found by the excavators at Olympia. – *Cheilon of Patras*, a warrior, an Olympic victor (year unknown), killed in the Lamian War (322). – *Kallikrates* of Magnesia-on-the-Maeander, hoplitodromos, twice victor. – A *pankration* victor, son of Philandridas, from Stratos in Acarnania. – Two statues at Pharsalos: one of Agias, *pankration* victor at Olympia, Nemea, Delphi, and Corinth; fragments of an inscription with the name of the dedicator Daochos II, a Thessalian tetrarch; similar epigram found at Delphi on the base of a statue forming part of a marble group dedicated by Daochos II about 332 (PL. 219; W. Dittenberger, *Sylloge Inscriptionum Graecarum*, 3d ed., Leipzig, 1920, III, 274; *IG*, IX, 2). – *Koreidas*, *pankration* victor (342 or 338), statue created after 316: an inscription has been found at Thebes on a block also bearing the signature of Polykleitos the Younger (inscription of the late 4th century). – *Apoxyomenos*, later set up before the Baths of Agrippa in Rome (PL. 220). – Quadrigas of many kinds ("multorum generum"), for victories in the games. – Group similar to that of Krateros mentioned above. – Fallen lion at Lampsakos, taken by Agrippa to his baths in Rome, funerary monument for a battle. – Unbridled horse, identifiable with the horse taken to the Hippodrome in Constantinople. – Statue of Pelopidas of Thebes, son of Hippokles, erected by the Thessalians at Delphi; a base with epigram and signature has been found. – Statue at Corinth; a base has been found with traces of feet, of the second half of the 4th century B.C. – Statue at Thermon: a signed base of the second half of the 3d century B.C. has been found, though the original inscription would be earlier. – Bronze statue dedicated by Theramenes, son of Timoxenos; base found in Megara. – Statue in Lindos, Rhodes; base fragment (ca. 325 B.C.). – Terra-cotta vase for the sending of wine to Poteidaia. – Statue with dolphin, with a foot resting on a support, signed by Lysippos, found at Siena, 1334–48, and buried again in Florentine territory, 1357, by the Sienese, who believed that its pagan presence had adversely affected their contest with Florence (recorded by Ghiberti in *Il codice Magliabechiano*, cl. xvii, 33, ed. K. Frey, Berlin). – Bronze dog licking a wound, in the cella of Juno in the Temple of Jupiter Capitolinus in Rome, destroyed in the fire of the Vitellians (A.D. 69).

MACCHIAIOLI. The most important school of Italian painters in the 19th century, this group was formed in Florence in the decade 1850–60 to oppose the influence of the Accademia and of the movement called *purismo* (see PRE-RAPHAELITISM AND RELATED MOVEMENTS). The school represents a minor but original aspect of European realism (see REALISM).

SUMMARY. Origin of the movement: theory and history of the macchia (col. 362). The artists (col. 365).

ORIGIN OF THE MOVEMENT: THEORY AND HISTORY OF THE MACCHIA. The name "Macchiaioli" was used for the first time in

the *Gazzetta del Popolo*, in an ironic reference to some painters who exhibited at the Florentine Promotrice of 1861 landscapes that they themselves called *macchie* (literally, "spots"), because the pictures were painted in patches of color accenting the contrast of light and dark. Adopted by Telemaco Signorini, the name Macchiaioli eventually was applied, often improperly, to all Tuscan painters of the 19th and early 20th centuries who tended toward realism.

The importance of the Macchiaioli consists in their vigorous return to reality in art — an aspect that the teachings of the Accademia had lost — and in a new esthetic awareness, growing out of the patriotic fervor of 1848 but rooted in earlier cultural developments under Hapsburg-Lorraine rule in Tuscany, which produced a cultured bourgeois class and a moderate liberalism.

The formative period of the Macchiaioli was that of the gatherings and meetings at the Caffè Michelangelo in Florence from 1850 to about 1859, when artistic interests were fused with the democratic ferment developing from the movement toward a liberal and united Italy. According to Signorini, this famous café became the meeting place of almost all the painters who had participated in 1849 in the campaigns of Lombardy and the defense of Rome, Bologna, and Venice, and the amalgamation of ideas and experiences of artists from all parts of Italy that took place there tended to revitalize the figural arts. Along with the original Macchiaioli, not all of whom were Tuscan, various other artists made some impression in Florence — the Neapolitan Domenico Morelli, who had previously rebelled against academic authority; the Roman Nino Costa; Antonio Fontanesi, who by 1855 had abandoned the traditional chiaroscuro in his landscape painting; and even some painters of other nationalities (e.g., Degas).

In the caustic atmosphere of the stormy gatherings at the Caffè Michelangelo modern Italian caricature was born, and here originated the first heated discussions on realism. Here, too, the artistic principles of the group were adumbrated. More completely formulated in the writings of Diego Martelli, Adriano Cecioni, and Telemaco Signorini, these principles were first outlined in the movement's two periodicals, *Gazzettino delle arti del disegno* (1867) and *Giornale artistico* (1873–74), and constituted a theoretical program of realism similar to that embraced contemporaneously in France by Thoré, Champfleury, and Castagnary. In Italy, however, there was a sharper critical attitude toward the artificial literary and rhetorical point of view that had entered even into the field of art. The Macchiaioli stood for the idea of art as a vital and genuine expression of the society in which it arises and the belief that the individual artist can evaluate contemporary society honestly only by a personal interpretation. Accordingly, the entire Italian tradition, having become pedantic and literary, impeded artistic progress. But the iconoclasm of these turbulent habitués of the café was not limited to assaulting either academic art — modestly represented in Florence by G. Bezzuoli, E. Pollastrini, and A. Malatesta — or the more refined but rigid manner of the Purists Luigi Mussini and Antonio Ciseri; it went so far as to deny all values that were linked in any way with academic training. Although such iconoclasm endowed the movement with great vitality, the limitations of the Macchiaioli lie in their very inability to adapt their innovations to a tradition that had produced great results in the line they were following. The resoluteness and the sincerity of their call to life justify the persistent attacks on "men of letters" and "literary critics" with which Signorini, Cecioni, and Martelli filled so many pages; these qualities also clarify the meaning that the *macchia* — the formal solution into which the fundamental requirements of the movement were translated — assumed for Italian painters. In so far as it was limited to immediacy of vision — "truth as it is and as it shows itself" — the *macchia* technique meant an absolute rejection of literary themes, and, as Cecioni said, "a return to the simple truth that figural representations have their origin in the eye" and are therefore nurtured by "the actual visual heritage of the artist." *Macchia* was only an accentuation of pictorial chiaroscuro, a way, as Signorini said, "to emancipate oneself from the primary defect of the old school, in which the solidity and relief of its paintings were sacrificed to an excessive transparency of the bodies." As early as 1854 Signorini himself tried to infuse new strength into his brush stroke, and the arrival in Florence in the same year of the superficial but vigorous Morelli furthered the first attempts of the Macchiaioli in this direction. Most of all, the interest in landscape painting and in the abrupt transition of light and shade adopted by French romanticists in the early decades of the 19th century stimulated the Macchiaioli. They may also have been influenced by English landscape painters who exhibited at the Salon of 1824 and by the landscapists, both Italian and foreign, who painted the countryside around Rome in the 1830s and 1840s. Costa carried out his experiments in that region shortly before the Macchiaioli. The painting of "abridged impressions" (so called by Castelfranco) was widespread in Italy about 1850. Serafino De Tivoli's trip to Paris for the Exposition Universelle of 1855 and the subsequent visit of the Macchiaioli group to the Demidoff collection near Florence were also important stages in this development. In Paris, De Tivoli was more attracted by the work of the landscapists of the 1830s — Corot, the Barbizon school, Troyon, and the Orientalist Decamps — than by the paintings of Delacroix and Courbet. Troyon and Decamps were represented in the Demidoff collection; there, too, the Macchiaioli could have seen some excellent Dutch paintings, as well as a few quick sketches by Delacroix. Costa's arrival in Florence in 1859 and trips to Paris in 1861–62 by Signorini, Costa, and Vincenzo Cabianca reinforced the orientation of the group. It was in romantic landscapes rather than in studio paintings that the Macchiaioli found what they sought: dedication to nature, immediacy of impression, sincerity. Moreover, these artists discovered the freedom of painting in the open, capturing nature in one of its innumerable aspects — as if by surprise — in that instant during which a single effect takes place. They favored distant views, one of their tenets being that the figures in a painting should never exceed 6 inches.

However, something of the romantic spirit disappeared in the Tuscan school, notably the taste for sentiment and mysticism. The Macchiaioli were interested not in abstract concepts but in objects, places, and living persons. They preferred full sun to dusky effects for precise delimitation of objects and chose fragmentary rather than panoramic views, devoting all pictorial means to the achievement of clarity and distinctness. Probably the Macchiaioli had no direct acquaintance with the early Italian landscapes of Corot, and the wonderful simplification by which he joined and contrasted surfaces through the use of light, or with the Italian vistas that Ingres occasionally placed in the background of his portraits. The spiritual affinity of the Macchiaioli with these painters derives from the example of Costa and, above all, the chaste "purist" luminosity of the early drawings of Giovanni Fattori, Silvestro Lega, and Giuseppe Abbati.

After 1860 the *macchia*, which had initially been a splash of chiaroscuro and nothing else, developed into a draftsman-like latticework, extremely sharp and simple, which has sometimes been compared to 15th-century work, but which actually derives from *purismo*. Like the pieces in a polychrome inlay, the *macchie* assume a natural balance based on tone and color value, serving by their tranquil and lyrical juxtaposition to articulate planes and to suggest volumes and distances. Wrote Cecioni: "The truth is born of spots of color and of light and dark values, each of which has an effect of its own that is measured by means of its relationships. In each spot this relationship is double — as value and as hue. When one says that the color is right in hue but not in value, it means that it is too light in respect to the other tones. For example, in the hue scale, yellow has a greater value than white. But in the scale of light and dark its value may be lower, if the white is in the shade and serves as a background to a sunlit yellow. The color never changes; the light has [only] the property of altering it . . . because shade does not act like a cloth but like a veil." This elementary theory of visual reality lies at the heart of the best period of this group, which, from about 1860 to 1880, made an unquestionably original contribution to 19th-century European painting.

After 1880 the Macchiaioli gradually lost the unity of inspiration and experimentation that had bound them together, and in consequence the quality of their production declined rapidly. Little by little, the group itself dissolved — Raffaello Sernesi died in 1866, Abbati in 1868, De Tivoli settled in London in 1864, Vito D'Ancona left Italy for a long time, and Signorini, Martelli, and Cecioni (who died in 1886) were away for shorter periods — and soon Italy was pervaded by a new, veristic trend which not even the talents of a Fattori or a Lega could resist. These two artists — isolated, misunderstood, and depressed by the general decline of contemporary culture in Italy — continued to produce works worthy of their best years. Toward the turn of the century Fattori found new accents of pure poetry in the spare and dramatic idiom of etching, in which he expressed powerfully his disillusionment and vexation with Italian society. The vast unified corpus of his 166 etchings fits unmistakably into that climate of harsh naturalism and pessimism which stamped so much of Europe's artistic and literary production during those years.

THE ARTISTS. Against this cultural background the differing personalities of the Macchiaioli group emerge. Nino Costa (1827–1903), fervent patriot and follower of Garibaldi, was only loosely associated with the group, retaining his ties with the Barbizon painters, but he is extremely important as a forerunner of the Macchiaioli, especially because of his contacts with French and English painters; his influence on Fattori was decisive. Among the less representative members of the group were Serafino De Tivoli (1826–92), whose best landscapes (PL. 240) were similar to those of the more advanced painters of the 1830s; Vito D'Ancona (1825–84), whose small studies reveal supple and succulent modeling (PL. 240); Cristiano Banti (1824–1904), a careful and talented, though old-fashioned, painter; and Vincenzo Cabianca (1827–1902), who initially distinguished himself for brutal intensity of light effects (PL. 240) but later passed into obscurity. Because of the wealth and variety of his experience, coupled with his aggressive stance and his qualities as a writer, Telemaco Signorini (1835–1901), a cultivated, talented, and receptive artist, was considered the most prominent figure of the entire group in his time. However, he is no longer so highly regarded, notwithstanding the excellence and animation of some his works (PLS. 234, 235). Among the first to attempt the *macchia*, he often visited Paris, where in 1861 he met Troyon and Corot and later Manet, Zola, and Degas. From Paris he also went to England several times. After 1875 he began to blur his brush strokes in order, like the impressionists, to obtain a maximum of light and air in his works. At times he tended to become merely illustrative, as in his etchings and dry points, for example. Close in style to Signorini was Adriano Cecioni (1838–86). Although he was also a sculptor, Cecioni's best contribution was as a painter and as a critic (PL. 239). His writings, though modest, provide useful documentation for this entire period. Quite different from these artists in artistic temperament was Giuseppe Abbati (1836–68; PLS. 228, 231). A student of Michelangelo Grigoletti in Venice, he worked in Naples in 1856 and went to Florence only in 1860, a veteran of Garibaldi's campaigns. His landscapes and studies of cloisters are marked by a meditative, intense melancholy and are among the finest paintings of the Macchiaioli. Raffaello Sernesi (1838–66; PLS. 229, 237) resembled Abbati in artistic qualities and in temperament. Some of the paintings that reveal his early attempts at *macchia* — in particular, a few delicate landscapes — are of the highest quality and may be placed on a level with those of Abbati. Lovely landscapes and interior views were also produced by Odoardo Borrani (1834–1905), whose extremely unequal work declined greatly after 1880.

The most outstanding figure of the group was Giovanni Fattori (1825–1908), unquestionably the leading Italian painter of the 19th century (PLS. 229, 232, 233, 236). He was not given to artistic discussions, but he had a rare simplicity of feeling, which he communicated directly through his work. He arrived at the *macchia* technique quite late, through the influence of Costa, and it was only in 1861 — the year he painted the *Battle of Magenta* and a magnificent little portrait of his cousin Argia (both, Florence, Gall. d'Arte Mod.) — that his apprenticeship, begun 15 years earlier under Bezzuoli, could be considered finished. The dating of his vast output was established in the Leghorn exhibit of 1953, tracing the development of his style from his first *macchie* of soldiers in 1859 to landscape studies executed with Costa, particularly in 1864–65, and through the period of his best production, in Leghorn and Castiglioncello, during the following 10 years. Several excellent portraits and the *Assault at the Madonna della Scoperta* (1864; Leghorn, Mus. Civ. Giovanni Fattori), a work of greater commitment and scope, also fall within this period. In 1873 Fattori went for the first time to Rome, and in 1875 he journeyed to Paris, where he remained almost a month. The great *Battle of Custoza* (1876–80; Florence, Gall. d'Arte Mod.), a painting with a certain dramatic force, marks a shift to a new inspiration that from this time on reflects his spiritual isolation. Ever more marked by bitterness and pessimism, his art began to reflect the more painful and squalid aspects of the Maremma landscape. This new tendency resulted in the domination of drawing over color and a turn to illustrative inflections, though he reached new heights of achievement in his etchings.

Silvestro Lega (1826–95), who finished his thorough apprenticeship with Mussini only at the age of 35, was the last of this group of artists to take up the *macchia* technique. However, it was precisely this late development that allowed him to make a first-rate contribution to the new idiom after he became one of the dominant personalities — along with Signorini, Abbati, Sernesi, and Borrani — of the Macchiaioli in the Pergentina group, about 1862 (PLS. 227, 230, 238; XI, PL. 444). After 1880 the sharp drawing that had characterized his early paintings occurred only infrequently, while his brush stroke became more forceful and his color vibrant. Like the other Macchiaioli, he was a convinced admirer of Mazzini and interrupted his studies several times to take part in the battles of the Risorgimento. Also connected with the Macchiaioli, although of a younger generation, were Giuseppe De Nittis (1846–84) and Giovanni Boldini (1842–1931; PL. 239), the latter before he established himself in Paris.

The first reliable appraisals of the Macchiaioli are to be found in the writings of Diego Martelli, the only Italian critic to have appreciated fully the impact of contemporary French painting. As early as 1879, in a memorable lecture on the impressionists, he compared the Macchiaioli to them, though granting the difference of relative values. After the turn of the century a real critical interest in these Tuscan artists developed, fostered by *La Voce*. In 1913 a fine check list of Fattori's works was published by Oscar Ghiglia, the first critic capable of singling out the true qualities of the Macchiaioli. Between 1920 and 1927 there followed penetrating articles by E. Cecchi and A. Soffici, which remain basic for the accuracy of their judgments and are important for their attempt to evaluate 19th-century Italian art in relation to contemporaneous European culture. Interest in the Macchiaioli was one example of the taste for the "primitive" manifest in Italy during the 1920s. For instance, Fattori was praised as "illiterate" with a "disinclination to polemics and theory," the "pure painter." Such interpretation of the work of the Macchiaioli was carried to the point of seeing in some of its characteristics (e.g., its elementary content and antiliterary subjects) a sign of a primordial simplicity and purity, almost a suprahistorical essence, capable, according to Tinti, of reaching, through mysterious biological roots, from the paintings of the Macchiaioli to Italian art of the 15th century. Despite the caveats of L. Venturi (1925), critics taking this stand placed greater value on the work of the Macchiaioli than on that of the impressionists, basing their judgments on the alleged "primitive" character of the Tuscan artists. In 1929 Roberto Longhi replied to these exaggerations and errors with a lively controversial sally, expanded later in his "Ragguaglio sull'impressionismo e il gusto degli italiani" (1949). However, he went to the other extreme of belittling excessively the significance of this art that represented, within its limits, an original elaboration of certain aspects

of European realism. More recently, critics such as Anna Maria Brizio, Giorgio Castelfranco, Lamberto Vitali, and Corrado Maltese have arrived at a temperate judgment of the contributions of the Macchiaioli, an evaluation supported by several exhibitions of their work, including an exhibit of late-19th-century art that contained some of their works, the VI Quadriennale of Rome (1952); a Fattori show in Leghorn and Florence (1953); and two recent exhibits of paintings by the Macchiaioli, one at the Galleria Nazionale d'Arte Moderna in Rome (1956) and another at the American Federation of Arts Gallery in New York (1963).

MACKINTOSH, CHARLES RENNIE. British architect (b. Glasgow, June 7, 1868; d. London, Dec. 10, 1928). One of the most notable pioneers of the modern movement in architecture, Mackintosh was the son of a police superintendent. He was educated at Reid's Public School and Alan Glen's High School, both in Glasgow. Apprenticed to the architect John Hutchinson in 1884, Mackintosh then enrolled as an evening student at the Glasgow School of Art. In 1889 he joined the architectural firm of John Honeyman and John Keppie as draftsman and became a partner in 1904. With three other students — Margaret and Frances MacDonald and Herbert McNair — he formed a group known locally as "The Four" and began to produce remarkably original drawings, posters, craftwork, and furniture. Exhibitions by "The Four" at home and abroad gave international prominence to his work, which in some aspects had an affinity with Art Nouveau.

In 1896 Mackintosh won for his firm the competition for the design of a new Glasgow School of Art. His design, because of its flexibility, spatial concepts, and freedom from historical styles, has come to be recognized as one of the most significant of that period. The first part of the school was constructed between 1897 and 1899, while Mackintosh was working on Queen's Cross Church (an essay in modernized Gothic) and the famous Cranston Tea Rooms, both in Glasgow, and a house for W. R. Davidson at nearby Kilmacolm. In 1900 he married Margaret MacDonald, and was also invited by the Viennese Sezessionists to exhibit in J. M. Olbrich's Sezession Haus in Vienna.

From 1900 to 1906 Mackintosh's reputation as one of the leaders in the new movement was securely established, and he had considerable influence abroad, particularly in Austria. During this period he placed second in an international competition for the design of a "Haus eines Kunstfreundes" held in Darmstadt. He exhibited at Turin in 1902 (I, PL. 468), and elsewhere in Europe, and entered the competitions for the Glasgow International Exhibition (1901) and the Anglican Cathedral of Liverpool (1903). His most notable executed works were Hill House at Helensburg (1902–03), for W. W. Blackie; Scotland Street School (1904), Glasgow; the Willow Tea Rooms (1904), Glasgow, for Miss Cranston; the interiors of Hous'Hill, Nitshill, Glasgow; and the redesigning of the west wing and library of the Glasgow School of Art. The latter building was completed in 1909, by which time Mackintosh had been elected Fellow of the Royal Institute of British Architects (1907) and Fellow of the Royal Incorporation of Architects in Scotland (1909).

For personal reasons, the Mackintoshes left Glasgow in 1913 and devoted themselves to water-color painting, first in East Anglia and London, then in the French Pyrenees.

Thomas HOWARTH

MADERNO (MADERNA), CARLO. The first of the great Roman baroque architects (b. Capolago, Lake Lugano, 1556; d. Rome, Jan. 30, 1629). Maderno was in Rome by 1588, working for his uncle Domenico Fontana, who presumably trained him in the rather arid mannerist style then current. His first major work — and one of the first examples of baroque architecture — was the façade of S. Susanna (II, PL. 137), completed in 1603. This design is clearly based on such famous mannerist prototypes as the Church of the Gesù (IX, PL. 312) by Vignola and Della Porta (qq.v.), most prominently in its vertical articulation; however, the differences between the two are generally held to mark the advent of a new style. Where the elevation of the Gesù is ambiguous and less systematic, S. Susanna is straightforward and simple; the steady progression from pilaster to single column to coupled columns focuses the viewer's attention on the doorway. In the same way, the sculpture is sharply defined within niches, yet given maximum plasticity. This combination of richness of detail and simplicity of articulation is characteristically baroque.

In the same year as his first notable work, Maderno was appointed architect of St. Peter's, where he passed much of his working life. In 1607 he won a competition for the transformation of Michelangelo's central plan into a Latin cross, a modification made necessary partly by lack of space. He added a nave — thereby destroying the basic concept of Bramante and Michelangelo — and, as a necessary corollary, designed a façade as well as the Benediction Loggia required by the new design. He contrived to mask the transept projections of the old central

plan behind an extended façade without concealing the dome. His solution was criticized on grounds of proportion, but such adverse judgment failed to consider the difficulties under which he worked, in particular the imposition of towers in 1612 (though never completed). Maderno retained Michelangelo's giant order and decorative details with great skill, but the need for the Benediction Loggia prevented him from developing his façade in depth, with a portico such as Michelangelo had planned: the resulting façade looks rather like a palace. The Maderno additions were consecrated on Nov. 18, 1626.

For S. Andrea della Valle (1608–28), Maderno designed the second largest dome — after that of St. Peter's — in Rome; but much of the church proper is by Carlo Rainaldi. Maderno's principal secular buildings were Palazzo Antici Mattei and Palazzo Barberini, both in Rome. On the whole, the Palazzo Mattei (1598–1618; II, PL. 132) is a simple, well-proportioned edifice of the normal Roman type with a central court; still, it has some features in common with the problematic Barberini, the first of the great Roman baroque palaces. Maderno's final design for the latter residence must have been completed by October, 1628, a few months before his death. It has been convincingly shown that all the new features in the plan (II, FIG. 285), especially the open forecourt (like that of a *villa suburbana*) in place of an enclosed court, are due to him and not to Bernini or Borromini. Borromini, Maderno's kinsman and assistant, remained as assistant to Bernini, who took over after Maderno's death but made few and unimportant changes in his predecessor's design (II, PL. 134).

Peter MURRAY

MAES, NICOLAES. Dutch portrait and genre painter (b. Dordrecht, Nov., 1632; buried Amsterdam, Nov. 24, 1693). The son of a well-to-do soap boiler of Dordrecht, Nicolaes Maes entered Rembrandt's studio in Amsterdam about 1648. He returned to Dordrecht in 1653, married the widow of a preacher in 1654, and bought a house in 1658; he fathered three children. In 1673 he settled in Amsterdam, where he remained to his death.

Maes was one of Rembrandt's most gifted pupils. Like many of the master's students, he began by closely imitating Rembrandt's style. This tendency is most noticeable in his drawings, which often resemble Rembrandt's so strongly that it is difficult to tell the two draftsmen apart. (A large number of Maes's drawings derive from a sketchbook that was broken up and sold at auction in 1922.) His early paintings reflect Rembrandt's style and choice of subject matter of the 1640s.

Maes concentrated on simple themes and favored a treatment of light and shade that created a mood of intimacy, warmth, and domestic quietude. Most of his pictures present women, both young and old, reading, spinning, peeling apples, threading needles, playing with or nursing children, and praying. Attentive to still-life accessories and to local color, Maes gave to his forms a somewhat greater degree of sculptural solidity and distinctness than Rembrandt did during the same period. Besides the inspiration of Rembrandt, Maes owed the compositional schemes of his pictures to such artists as Carel Fabritius and Pieter de Hooch (qq.v.). In his later genre scenes, possibly in response to a demand from his patrons, he stressed anecdotal elements. The subject of a man or a woman eavesdropping on a pair of lovers seems to have enjoyed particular popularity.

During the last decades of his life, Maes devoted himself increasingly to the facile but lucrative practice of portrait painting. His characteristic subjects were middle-class people, placed before curtains or landscape backgrounds to enhance their stature. These portraits are apt to be somber in color and never achieve the elegance of those of Van Dyck; at their best, however, they are dignified and forthright statements of individual personality or frank likenesses.

Julius S. HELD

MAGIC. In the history of art, magic pertains to a broad category of works intended to interpret, express, or utilize the supernatural. To be sure, it is difficult to isolate theoretically the concept of magic from the beliefs and practices proper to religion, especially in ancient and Oriental cultures and in primitive societies (see COSMOLOGY AND CARTOGRAPHY; DEMONOLOGY; DIVINITIES; ESCHATOLOGY; MONSTROUS AND IMAGINARY SUBJECTS; TERROR IN ART). Nonetheless, in practice the phenomena and attitudes connected with man's manipulation of mysterious forces give rise to the creation of various objects and figures and inspire iconographic types that may be considered apart from religion. From their practical origin, magical concepts have gradually become, especially in the modern world, a fringe aspect of literary and philosophical thought, bordering on the esoteric, the occult, and the symbolic.

SUMMARY. Introduction (col. 370): *Nature of magic; Magic and artistic creation.* Types of relationship between magic and art (col. 373): *Sympathetic magic by means of images; From image to symbol; Unseen art; Sympathetic magic in architecture; Pars-pro-toto magic in art; From the magical to the esthetic.* The iconography of magic from antiquity to the modern West (col. 380): *Prehistory and the ancient Near East; Greece and Rome; Christian art until the end of the Middle Ages; Magic as a "Faustian" subject: a. "Romanticism" about 1500; b. The myth of the magus; c. Homo divinans; d. Astrology; e. Alchemy; f. The mysteries of hieroglyphics; g. Demons; h. Witches; i. Romantic occultism and surrealism.* Aspects of magic in Asia (col. 388).

INTRODUCTION. The term magic (from Gr., μαγεία) was introduced in the classical world to characterize the practices of the Mazdean Magi but was eventually extended to designate the activity of every kind of conjurer whose procedures did not correspond to those of a recognized religion; this more general meaning of magic is that in use in the modern world.

When the scholarly study of comparative religion was begun in the 19th century, the operational distinction between official religious acts and marginal magical activity was applied as well to the abstract concepts of religion and magic. Magic was then regarded as that which differed from the canons of the polytheistic and monotheistic religions inherited from the past and which seemed to be identifiable with certain attitudes "surviving" among the European folk (see FOLK ART) without being displaced by the tenets of Christianity. Such an identification led to the ascription of inferiority, of primitive status, to those religious forms in which magic (or what was called magic) was a major cult expression. With the exception of certain French sociologists (Jean Hubert, Marcel Mauss), who regarded only individual practices as magical, distinguishing them from the common religious activities of the whole people, evolutionary theorists saw in magic a prereligious stage in mankind's intellectual progress. In this stage, of which "primitive" cultures were viewed as an example, man trusted simply in the efficacy of his own acts to achieve his ends, somewhat in the manner of a contemporary scientist (and, in fact, E. B. Tylor, James Frazer, and others spoke of magic as a pseudo science). According to R. R. Marett, however, magic arts served to manipulate an impersonal force (mana) distributed among various elements of nature, man included.

With the dissipation of the predominantly evolutionary climate of thought, the theory of a primitive magical phase in the religious history of mankind was abandoned, but the equivocal identification of magic with all that which seemed to lie "below" the level of "genuine" religion remained. (Religion here was understood as comprising polytheism and monotheism, to which was added W. Schmidt's *Urmonotheismus*, based on the supreme beings of the "primitives.") Thus, manifestations of a magical attitude toward the world were discerned not only where perhaps it was legitimate to do so,

as in shamanism (q.v.), or, more broadly, wherever the figures of the magician, wizard, or healer occur, but also in typical ritual forms connected with complex ideologies [e.g., totemism (q.v.), ancestor cults, spirit worship]. Such rituals, not being directed toward "divine" beings, were interpreted as revealing a magical mentality or consciousness or the conviction of the capacity to operate directly without the aid of deities.

Nevertheless, for the purposes of this article, which is to consider the relationships between art and magic both within and beyond the limits of Western civilization and to describe works of art generated by magical concepts, it is useful to consider the possibility of a generic magical mentality or consciousness and to examine the hypothetical character attributable to an artist-magician, for whom ritual realization of supernatural forces plays a greater part than philological abstractions. For further discussion of objects serving religious (and sometimes magical) purposes see LITURGICAL AND RITUAL OBJECTS. For primitive concepts that partake of folklore, religion, and magic, and that include magical ceremonies of apotropaic, curing, divining, fertility, initiation, hunting, and harvest significance, see AFRO-AMERICAN ART; ASIA, SOUTH: TRIBAL STYLES; AUSTRALIAN CULTURES; BANTU CULTURES; CUSHITE CULTURES; GUINEAN CULTURES; and the like.

* *

Nature of magic. Conscious magic presumes the oneness of the physical and the spiritual being; the spiritual is in some way material, although endowed with paranormal characteristics. The magician, or magical type of man (*homo magus*), and the visionary or seer (*homo divinans*) are often eidetic types in the sense described by E. R. Jaensch, who has shown that even today, among children and among some artists, evidence of subjective visual images can be found, and that perceptions of things which have happened, or even only been imagined, can be projected as if they were optically visible. The eidetic type has a tendency to visions and hallucinations and takes his dream life for reality, often even a higher reality. This tendency is linked with an inclination toward autosuggestion or mass suggestion and the hypnotic phenomena that accompany them.

There is a distinction between the more active and the more passive forms of magic. In the narrower sense magic implies an active influence of the magician on the world around him without the mediation of mechanically and causally understandable actions (e.g., without contact or direct hearing and seeing). Such magic depends upon known rites and ceremonies and requires a special kind of self-awareness in the practitioner, a reliance on his own secret spiritual powers; these characteristics distinguish the magical intention (including its *deisidaimonia*, or respect for demons) from the humble attitude of the pious or mystical man of Western tradition. The principal form is the banishing ritual, which includes magic healing and similar phenomena. Sympathetic magic plays a decisive part, and its consequences will be discussed below in relation to the making of works of art. If the intention is harmful, as in the well-known practice of sticking pins into a wax image, the procedure is called "black magic." The power of the image explains the shyness of certain peoples in front of mirrors or any other means of obtaining a likeness, though nowadays the contrary mass suggestion of photography and the cinema has almost eliminated this fear. Opposed to black magic is the tradition of the "white" magician: in contrast to Faust there is Shakespeare's idealized figure of Prospero in *The Tempest*, who uses his power wisely and without the help of demons (or of God either) for the benefit of his fellow men. While the successes of practical magic may all be attributed to the occurrence of hypnosis and autosuggestion, which have been recognized by science but not completely explained, magic remains to some extent effective even for modern man. In the major religions of the Western world magic has been condemned, not because magical relationships were impossible, but because they were misused. Christianity, however, distinguishes between magic and miracles; the latter are attributed to the grace of God through intermediaries, as in the case of blessing, the healing of the sick, and the transformation of the Sacraments.

The results of magic and miracles often appear alike in certain phenomena such as ecstasy or levitation, which occur both in the legends of the saints and in the accounts of sorcerers, and no distinction is made in non-Christian religions. For example, in Indian belief certain deities appear in person as the supreme magician to bring about the materialization of the entire world by an act of immense psychic concentration.

In a wider sense magic includes many passive, or predominantly passive, experiences, for example, intuitive or inspirational receptivity in the seer or clairvoyant, including the interpretation of signs by intuition according to special, definite indications, such as divination (PLS. 252, 253), oracles, and astrology (which, in the form of astromancy, may be compared with the more active magic of alchemy). Also there is often no distinction between magic and a belief in demons or devils, ghosts, and the spirits of the dead. For this reason, and also because of his Faust-like presumption, the more mediumistically talented magician, in trying to redeem himself, incurred the Church's censure on suspicion of Gnostic heresy (see HERETICAL SUBJECTS). In the representation of magic, poetic and artistic freedom of imagination may constitute the last sublimated state of the magical consciousness, making connections with mythology and legend and surviving uncorrupted in the paganism of fairy tales. Language preserves the remains of these relationships in such words as "enchanting," which often carry a transferred esthetic or erotic meaning deprived of the original magical implication.

Magic and artistic creation. The historical relationship between magic and art has been accentuated by the inner affinity, first emphasized by the romantics and then by the surrealists, between artistic creation, with the purely esthetic "enchantment" it evokes, and magical practices. The influence of the subconscious can be traced in both. Faces seen in dreams, and other forms of visions and hallucinations, seem to be of the same nature as the artist's fantasy. It cannot be determined whether the amazing "impressionism" of the late Stone Age cave paintings of animals (PL. 241) is related to the eidetic disposition presupposed in the *homo magus*. The artist's inspiration may be compared both to the trance conditions of the medium and to the visions of religious ecstatics, but the ancients equated singers (or musicians) and seers (*poeta* and *vates*); the Greeks classed the output of artists working with material forms as artisanship, not as art, because of the manual labor and material elements involved. However, painters, sculptors, and architects have also had secret inspirations and miraculous triumphs. The divine revelation of a building site or plan to the architect or donor of a sacred building is a legend common to many cultures, and from such legends there developed complex geomantic rules codified for the use of architects, as occurred in India and China. Perhaps the old Chinese *fêng-shui* also belongs to this category, although it deals not only with visionistic suggestions but also with a whole system of apotropaic, geomantic, and cosmomorphic considerations whereby the proper site for settlements or temples may be determined. In a very broad sense one may include also the fact that there are in mythology a number of gods and demigods who are expressly in charge of the visual arts and inspire artists and craftsmen. Among these are the Indian architect of the gods, Viśvakarma, and two Egyptian architectural gods, Ptah and Khnum. It is noteworthy also that the builder of Zoser's pyramid, Imhotep (q.v.), probably the most ancient architect whose name has survived (if not absolutely the most ancient of all artists known by name), was later mythologized (he was made a son of Ptah) and turned into a great initiate of poetry as well as of the healing art (the Greeks identified him with their medical god Asklepios), a classic case of the union of artist and "white" magician in one person. In Greek mythology there were the hero Prometheus, a magician-sculptor, and the god Hephaistos, who was conceived as a smith.

In this connection it is interesting that among many African tribes the smith is regarded as a wizard, endowed with gifts (or knowledge of arts) that are of a broadly magical character. The making of objects themselves, apart from their intent or

final appearance, often presents itself as a magical activity, not only because of the magical symbols and designs which may be associated with them, but also because of the magical power of the material employed (e.g., iron and other minerals, certain plants, hides of certain animals, bones, shells), which only certain persons are permitted to manipulate. The form of the object produced often corresponds to a significant image rather than to a purely practical, utilitarian shape (e.g., the scythe in the form of a crescent moon). The magic involved in creating an object does not necessarily imply that the product must be used in sacred rites; a magically potent material or form may be intended for efficacy in hunting or in harvesting.

Thus it appears that the art object intended for magical purposes is not born from subconscious inspiration; rather, the magical act of creation and its product are closely linked to certain "sacred" techniques, or techniques consecrated by tradition, which only the magician may know and use (his profession is an art as well as a gift). The true artist preserves conscious control over his creative inspiration through his knowledge and understanding of his art. The art products of paranormally gifted persons (mediumistic drawings and so forth) and the paintings of mentally disturbed persons, therefore, generally fall outside the categories under consideration here (see PSYCHOLOGY OF ART).

TYPES OF RELATIONSHIP BETWEEN MAGIC AND ART. Magic, in addition to its connections with religion, cult practices, and the myth-making imagination, may at times be the prime inspiration for the creation of works of artistic worth and purpose in their own right. On the other hand, a work of art may merely represent magical figures and events for illustrative, didactic, or symbolical purposes. In the latter case, magic, with the allied subject of demonology (q.v.), simply constitutes a particular field of artistic iconography. It depends on the point of view whether representations from the enormous field of religious (or mythical, or legendary) miracles should also be regarded as magical. Generally such representations treat paranormal happenings either as cases of mystical transcendence, having no basis of comparison with the natural course of events, or else in a matter-of-fact traditional and dogmatic way. Within the terms of reference here such works would come under consideration only when the miraculous borders on the magical, the supernatural on the occult, the divine on the demonic, the sacraments on thaumaturgy, and the priest on the magician.

Sympathetic magic by means of images. In all parts of the world sympathetic magic offers the broadest scope to artistic expression. If the image of a being is prepared with certain ritual precautions, it is thought to create a certain teleplastic influence on the thing represented. Two principal forms can be distinguished: the first is concerned with the likeness, caught as in a mirror, of anything (men, beasts, and objects) which has once been visibly present; the other kind is concerned with the images of invisible beings. The first group includes everything connected with funerary magic (see ESCHATOLOGY). All over the world, regardless of differences in cultural, racial, and geographical background, men have believed that the preservation of the bodily form of a deceased person with his possessions ensures for both of them some kind of continued existence after death. Even if the ancient practices seem to reveal an invariably causal pattern of thinking, they also reveal an extralogical conviction of the continued existence of the spirit both within the grave, where the form is preserved, and beyond it, in an invisible dimension. Presumably the soul of the deceased, which has in some manner conditioned and formed his personal appearance, can free itself from the body and maintain a shadowy existence if it receives the appropriate magical help by means of its image. Of course, the image, if it is to give this help, must first be equipped with magical spells. This idea played a dominant part in Egyptian life. There the first stage in the magical preservation of life consisted in the preservation (mummification) of the corpse itself with its tangible array of grave gifts (IV, PLS. 449, 454, 460); the second phase was the pictorial representation of the deceased with his belongings, and artistic merit in the representation could redound to the honor and benefit of the deceased (see EGYPTIAN ART).

Just as the form of the image in funerary painting and sculpture was intended to produce results magically for the dead, so it is supposed to have done for the living long before in the period of paleolithic cave art. Animal paintings and relief sculpture executed deep within caves (PL. 241), as well as figures carved into high rocky exterior projections, have generally been interpreted, from the time of the earliest paleoethnologists, as evidence of purely magical intent (see ARCHAEOLOGY; PREHISTORY). It is supposed that the image, through the psychic effort of concentration (perhaps accompanied by ritual dancing) involved in its execution or contemplation, was intended to influence the creature represented and compel it (telepathically or telekinetically) to show itself or to facilitate the hunt. Modern ethnology provides parallels to this procedure. That this was the practical aim seems to be proved by the numerous wounds on the animals represented (PL. 241), but in many prehistoric representations other aims of a more magical or religious sort probably also entered in. In such cases as the famous "Venus" of Willendorf (PL. 247), the aim seems to be fertility and the multiplication of the species. The figural representation was apparently intended to achieve something akin to a solemn placation of the "animal spirit," the "group soul," or a divinity ruling over the animal kingdom. Thus there is implied a transition from a purely magico-utilitarian concept to something specifically religious, from the magic rite to the cult act. Recent studies have emphasized the effective presence of religious elements in combination with (if not even prior or opposed to) the magic factors. Such an opinion is supported by the inaccessibility, obscurity, and consequently sacred character of the galleries deep within the earth. Standing for the animal, the representation must have acquired heightened powers, not through a magic constraint but through prayer, though even a cult of this kind probably preserved many magic elements.

In contrast to a verifiable memorial portrait of the deceased is the imaginary representation, which the artist (priest, shaman, or medicine man) envisions in a dream or trance, and under certain circumstances this imaginary portrait can become established in tradition. By a similar process secret powers in nature, previously unpersonalized, come to be materialized and acquire more personal traits. In the romantic literature of mesmerism and magnetism it is asserted that these powers exist in the form of fluid rays. On the primitive level the manufacture of fetishes is an attempt to turn these powers to use. The need to render visible and tangible the formless powers perceived in the universe is a recognized psychological development.

The objects produced in connection with the fetishistic attitude may be divided into two classes, the fetish object and the fetish idol. The purpose of the first is not the representation of impersonal forces but the control of these forces through a concentration of various elements and signs that may be brought to bear on them. Fetish objects may take the form of stones, sticks, skins, and the like, with incisions and designs, but the typical example is the skin bag containing the various elements prepared by the witch doctor. To this main type belongs the amulet endowed with therapeutic and apotropaic powers (PLS. 243, 248, 249), the use of which is documented from prehistoric times and in both primitive societies and advanced civilizations. A particular type of amulet, often of fine workmanship and valuable material, is the talisman. Instead, the fetish idol (PL. 250) personifies the forces in theriomorphic or anthropomorphic forms, the aim being to reconcile the nonhuman with the human and to make the former approachable and ultimately controllable. These are not likenesses but forms by means of which the shapeless forces are fixed; although understood differently in different cultures, this is the essence of the magic operation. For example, among the Tungus one of the most important functions of the shaman is to induce spirits to enter into wooden forms prepared for them.

The magical aspect of the making of idols sometimes occurs in polytheistic religions, in which the figure is not a fetish but

the image of a god. Among the Maya, for example, the craftsmen assigned to carve wooden idols were terrified by the task before them; they accepted it with great reluctance and, assisted by priests, had recourse to fasts, sacrifices, and preparatory rites. In monotheism, which also distinguishes between the god and the image of the god, there sometimes exists the tendency to regard the latter as magically effective in itself. This attitude accounts for the more or less strict rejection of images in the Jewish and Islamic religions, the Byzantine iconoclastic controversy, and the Protestant views on images. Statues in particular presented a special danger to be avoided; the surprising rarity of sculpture in the round in Early Christian and Byzantine art may reflect the widespread belief that demons entered images of this kind to take advantage of an externally holy appearance.

Positive images that partake of numinous power and radiate it include, under numerous transitional forms, those of the world-wide realm of demons. Figures of demons were supposed to ward off other harmful spirits, especially in the material and elementary worlds (fire, water, etc.) as well as to terrorize and banish all human enemies. Of all the magical elements in art this apotropaic pictorial magic has been the best recognized and perhaps one-sidedly overemphasized. The study of non-Christian art (in primitive cultures, in ancient Egypt, in Asia Minor, in India, the Far East, and America, and also among the ancient Nordic, Celtic, and Germanic peoples) has emphasized protective magic (PL. 244) as the reason for the creation of innumerable typically horrific figures, including many fantastic mixtures of man and beast (IV, PLS. 166, 167). Often their original appearance represents some archetypal vision, which in time was taken as a norm. The union of human and animal forms — as exemplified in Mesopotamian art (I, PL. 515), ancient Egyptian art (IV, PLS. 354, 369), Hittite art (I, PL. 523), ancient Nordic and ancient Mexican art (X, PLS. 1, 21, 45), and Romanesque sculpture (IV, PL. 178) — was not originally meant to be interpreted allegorically; rather, it came into being because the subconscious dream symbol thereby appeared to indicate a multiplication or enhancement of the magical emanations (the mana of the South Sea Islanders). In the beginnings of classical antiquity, and in Greek and Etruscan art, as is shown by the abundance of masks, acroteria, and Gorgons' heads (PL. 244; V, PL. 38) in the temples, magic was an active ingredient, and the apotropaic impulse is still to be discerned in Christian architectural sculpture, for example, in Romanesque capitals and Gothic gargoyles.

From image to symbol. It is noteworthy that the earliest surviving art works of presumed magical intention — the often cited Magdalenian cave paintings and rock engravings — represent reality, especially animals, with an exactitude of detail that is not otherwise encountered except at late and highly developed stages of stylistic evolution. (Obscure abstract symbols are sometimes found along with these representations.) On the whole, the magic of art, in the narrower sense described above, is not found where fleeting visual impressions of movement have been caught and fixed with great skill but in the extension of the kind of art which Wilhelm Worringer has described as "abstraction" and has contrasted with "empathy" (*Einfühlung*). It is not known whether the art of Aurignacian man, which by contrast with the Magdalenian already looked old-fashioned, was perhaps followed by a now-lost stage in which the magical purpose was more strongly emphasized and which would have appeared primitive in comparison with the other known stages. Generally the power of fascination, which is of the essence of a magical effect, is lacking in images that convey their meaning by outright imitation. Realistic (or even "idealized realistic") and impressionistic art cannot usually be said to have a truly magical intention, although in certain directions the illustration of magical subjects, as in Far Eastern painting, in Magdalenian art, and in certain primitive areas, arose out of an impressionistic manner of seeing.

In the context of the history of art as a whole, magical works of art, in the sense defined above, appear to use the emblem instead of the picture as an abbreviation, a written or visual formula, for the object that is secretly identified with, works through, or is even concealed in the art works. This difference between realistic and symbolic magical representation arose at the beginning of the Neolithic period. Symbolical representation, though naturally it compressed reality differently in different cases, continued to prevail in the Bronze Age, with its psychological, economic, social, and technical advances.

The range of symbols (including a few isolated magical pictorial formulas dating from the Old Stone Age) extends from crude and awkward drawings to highly advanced representations and involves a number of forms which, as psychological analysis shows, have a suggestive and slightly hypnotic effect on the beholder. Among these forms (in the early archaic period of Egypt and in early Greece) are the stiff, eerie, lifeless, and yet in some way ensouled images of men, demons, or gods. The effect is especially strong when the purpose was (not so much in Egypt and Greece as in the Early Christian, medieval, and Byzantine periods) to represent the actual gaze of the deceased with the hypnotic and magical effect of, first, the evil eye and, later, a suggestion of healing. Besides the stiff frontal aspect, which the Egyptians so often avoided, there occurs an arrangement in monotonously similar rows, a soporific design that suited the Egyptian style of relief, and a heraldic symmetry of arrangement, common in organic and inorganic nature but included in magical art as an effective means of producing a slight spiritual shock by its suggestion of unfriendliness and remoteness from life. As is well known, all these and similar principles of form are used occasionally in pure ornamentation, especially when there are no organic elements drawn from the realm of plants or animals, as was commonly the case in the antique and early Gothic periods. At that stage the naturalistic forms were made to look strange by stylization or by being mingled with demonic signs and figures with an aura of black magic, such as dragons and other fabulous beasts and especially snakes, which so often have a mythical and psychological import. A widespread apotropaic motif is the eye ornament (PLS. 244, 245). In contrast to the antique and even earlier preference for a static style, the decorative arts of the Nordic, Celtic, and Germanic peoples developed, partly in elaboration of Oriental patterns, a new and dynamic style of labyrinthine and monotonous interlaced bands, in which the metamorphosis of inorganic forms into the heads of living animals and demons is quite eerie. These artistic elements, whether used in ornamentation or as separate symbols, were not merely decorative but had originally a magical intention.

In general, magical ornamentation retains an ancient rigidity. This was the case in the early Middle Ages, whereas in the 12th and 13th centuries there was a greater tendency toward a mystical subjective sense of nature. However, the ornamentation of the late northern Gothic style, especially in the great altarpieces and in the church porches, shows a great liveliness, notably in the treatment of draperies. A strange vitality is imparted to naturalistic leaves and branches and, even more, to the broken folds of cloth, which appear to be blown by a magic wind unaffected by the mechanical laws of gravity, and thus the inherently lifeless becomes a vehicle of invisible powers. The style seems to reflect a revitalizing of "Faustian" magic (see below) characteristic of the late Middle Ages. The transparence and immaterial weightlessness of the early Gothic style (see GOTHIC ART), with its mystical impulse, is in contrast to this panentheistic naturalism of about 1500.

In cultural regions where the magical and voluntaristic element is not contrary to the religious attitude, specific influences of this kind can be demonstrated in art works of hieratic style. Thus in Indian yoga and in comparable practices among Taoists individual meditation techniques have had an influence on Asian devotional art.

Unseen art. Magic and magico-religious characteristics are indicated by the fact that in archaic regions many paintings and sculptures (and not only the objects of cult reverence, which would include "ugly" images, but also those which now appear rather decorative and even symbolic) were originally located so as to be almost or entirely out of sight. [However, the difference in Australian cave paintings is notable in this

respect. See AUSTRALIAN CULTURES.] In prehistoric cave paintings it is often noticeable that some pictures have been painted over others without any attempt to efface the underlying ones. This fact suggests indifference to the impression of unesthetic confusion that might be conveyed. Apparently the only thing that mattered was the act of painting itself, and, although there was room enough elsewhere, the work was done so far as possible in the same place, as though the place were sanctified by tradition or had some particular efficacy. Furthermore, tomb furnishings, from the extensive and often costly paintings and sculptures in the graves of royal mummies to the simple urn for ashes with a mere indication of a human figure (IV, PLS. 449, 452), were intended to remain visible to the clients and workmen for only a very short time until they disappeared "forever" in the darkness. The same is true of much of the art, generally said to be apotropaic, on sacred buildings. Even when such art is easily visible, as over doorways, the question remains whether the dimensions, sometimes very large, may not have been intended both as a defense against demons and an inspiration to religious fear in men. Many examples of unseen art are provided by Egyptian sculptures and reliefs in tombs or high on the inaccessible tops of obelisks and by the originally almost inaccessible figures of animals, demons, or saints, which were often almost or quite invisible from below, on the upper parts and roofs of Romanesque and Gothic churches. These figures, from their recognizable interpretation, as well as their material costliness and artistic value, were primarily intended to be looked at by the invisibles, that is, by spirits, demons, the gods, or God himself. Art of this kind was not produced in the West after the Renaissance. Later decoration, even if of symbolic and instructive nature or erected in an inaccessible position, is in proportion to the remoteness of the human beholder. The influence of the human observer appears also in the summary treatment of the form, without detail, and in the measurements, which show that the figure is intended to be looked at from below and from a distance with a certain foreshortening. The backs of the images are left more or less unfinished, in contrast to the treatment of unseen parts by the earlier sculptors and stonemasons.

Sympathetic magic in architecture. In addition to the protection of buildings by images of numinous or demonic beings, another method, also derived from the magical attitude to the world, was to create in the building itself analogies with numinous cosmic relationships, thus giving it a share in the eternity of its prototype (see COSMOLOGY AND CARTOLOGY). Evidence of this belief appears from the primitive and archaic stages of the Bronze Age. The monuments may be roughhewn or left almost in natural condition; they may be accurately prepared and finished by stonemasons, as in the case of freestanding monuments, stone circles, gateways, boundary stones, processional ways, and cult places of megalithic and cyclopean type (e.g., V, PLS. 160–165); or they may be architecturally refined buildings, such as temples with closed courts and inner rooms. Besides the powerful effect of size in these colossal or cyclopean works (which were not originally intended to "elevate" in the esthetic sense but rather to create a demonic or numinous shock), there is also a directly magical factor (comparable to that in ancient music) derived from transferring to the architectural proportions of a building the figures and measurements of the geocentric universe (the 7 planets, the 12 signs of the zodiac, the 4 elements, and other mystic numbers). The seven stories of certain step pyramids and ziggurats show this relationship. Cosmic relationships survive in all number mysticism related to building.

Even the orientation of the axes of buildings toward certain significant points in the astronomical sphere, with its calendar symbolism, belongs to the art of magical protection. Examples of this are the orientation to the rising of Sirius, to the position of the zodiac in spring, and to the sun's position at the summer solstice. In Islamic and Christian architecture the orientation, for historical religious reasons, is toward Mecca or toward the Holy Sepulcher, rather than the older cosmic directions.

Another kind of magical insurance is the choice of astrologically favorable moments for laying foundation stones or beginning construction and the casting of horoscopes for individual buildings and towns. This practice is based on the idea that buildings erected by the hand of man will partake of the divine world order. At the time of the early Italian Renaissance, which was influenced by occultism, there was a recrudescence of these "Egyptian" or "Chaldean" ideas, influenced by the writers of late antiquity or perhaps by masonic tradition [cf. Francesco di Giorgio Martini, *Trattato d'architettura* (1482), Turin, 1841].

Besides the astrological guarantees thus given there were also rules of geomantic or geomagical kind. A well-known example is the occult knowledge in the Chinese Taoist *fêng-shui*, the lore according to which certain apotropaic (rather than climatic, hygienic, defensive, or even esthetic) conditions had to be fulfilled in order to determine the right time and the lucky site for the building of a house or settlement. As with astrology, the practice of divination is bound about by traditional, rigid, and complex rules. It has not yet been proved whether in this connection the choice of sites for towns, funerary monuments, and temples was originally influenced by chthonic and magical ideas. In any case, it is noteworthy that many sacred Christian buildings were erected, not, as might be expected, at a conspicuous distance from earlier heathen sanctuaries, but directly on their remains, presumably in order to facilitate conversion by making use of the deep-rooted beliefs of the converts in the sanctity of particular places and regions. Unfortunately, the posthumous survival of number mysticism (Egyptosophy, pyramid mysticism, and the like) from late antiquity to the present, with its fantastic and hasty interpretations, has confused rather than answered the question of magical significance in architecture.

Pars-pro-toto magic in art. Besides similarity to the whole — either as image or in measure and number — another kind of magic that stimulates the creation of art forms is the symbolism of a single part that stands for the whole. The cult of relics (bones, ashes, fragments of the corpse of a hero, saint, or martyr, which are supposed to bring blessing to those who possess and honor them) is in the Catholic churches not entirely reduced to a cult of mementos but in many cases has been related to miracles. Even in classical antiquity, in Buddhism, and in Islam, relics have had an influence that cannot be entirely distinguished from the practices of magic. Primitive practices have a similar aspect in relation to the magical use of bones, teeth, hair, and so on. Purely phenomenologically, it cannot be denied that autosuggestion and mass suggestion (which are characteristic of the magical mentality) have an influence on the belief in the paranormal powers of relics. This kind of faith has many connections with the visual arts. Many shrines, chapels, and churches have been erected over relics. From the 4th century on, altars were erected over the graves, sarcophagi, or remains of martyrs. The growing cult of relics, together with the sacramental function of the altar, had a strong influence on architectural planning and design. Crypts, both subterranean, as the burial places of martyrs in the catacombs, and partly subterranean, as in the east end of the choir of medieval churches, became uncommon in the Gothic period, not only because of changes in religious tenets but also because of a subconscious change of convictions anticipating the Reformation.

No less significant for art, in connection with the belief in the power of relics, was the use of reliquaries for the preservation and exhibition of wonder-working contents. The enormous expenditure of costly materials and the artistic workmanship of dazzling effect express, in the naïve manner typical of the magico-monistic state of mind, the magical and miraculous aspects of religion. A significant symptom of this development, comparable to the disuse of subterranean crypts in the later Middle Ages, is the growing practice of opening reliquaries, from the Gothic period on, to exhibit the contents, which formerly were not visible.

Monstrances, the liturgical receptacles for the consecrated Host, are related to the reliquaries and owe much of their mystical glory to the same half-unconscious attitude. For the

same reason early medieval liturgical books were often bound with barbaric splendor and overloaded with glittering semiprecious stones.

From the magical to the esthetic. Comparable to the evolution of the image into the symbol is that of the magical representation to the esthetic level. So long as the magical belief is operative, the artistic products are pertinent to the voluntaristic effort, to the magic action, and to the working techniques. After the magical belief has been superseded, the techniques and the products remain, but the identification with the original meaning is lost or weakened. The symbol that had magical power is transmuted into an emblem. Romantic poetry changes images and moods of magic and wonder into merely fictional fantasy, into the poetry of "as if," eliminating the element of fear and creating a sort of game. In the visual arts, images as a means of conjuring the supernatural powers give way to others in which the powers are no longer thought of as present but are simply honored as implied potencies (as in holy pictures, votive gifts, and devotional objects; see DEVOTIONAL OBJECTS AND IMAGES). However, in the long run, the magical powers are not abolished but are sublimated in various ways; the magical experience survives in the secret miracle of artistic creation. The preservation of the words "magical," "miraculous," and "enchanting," though they may be used esthetically, shows the connection.

The earliest example of a marked supersession of magic in the West comes from ancient Greece, where classical and postclassical art, with its images and myths of the gods, indicates not so much complete secularization as a purified religiosity, from which the magical element has been virtually removed. The recrudescence of "superstition" in late antiquity, which opened the arts to Oriental and perhaps Nordic influences, met in the Early Christian period and the Middle Ages a second wave of magical depotentiation. Later, as will be shown below, magic appeared only in illustrations and allegorical descriptions. In certain forms of modern art (surrealism, tachism, *informel* art, etc.), whose advocates are fond of using the word "magic" in a transferred sense, it often appears that there is an intent to reactivate magic on a new level.

A few examples may illustrate the transformation of magic to the esthetic plane and at the same time will lead on to the questions to be dealt with in the subsequent discussion.

(1) Light and shade: Sunlight has always been regarded as a perceptible revelation from above, from the realm of the superconscious, the holy, and the divine. Darkness, whether the complete darkness of the inner earth (caves) or the darkness above the earth dimly penetrated by the moon, conveys an eerie and demonic impression. The mixture of light and dark — as in the dimensional depth of late Gothic altars, in works such as those of Correggio (q.v.), with his chiaroscuro, and especially of Rembrandt (q.v.), with his acausal lighting — may still remind the observer of the old Gnostic dualism of the kingdoms of light and dark and the struggle between them. On the other hand, Caravaggio (q.v.) and the *tenebrosi* eliminated the secrecy of darkness and made it a mere resource of painting; similarly the French impressionists (most of whom were personally indifferent in matters of religion) neutralized light and made it an object of rational analysis. In the 20th century the repression of the shadow has gone even further, with an overemphasis that may be expected to produce a reaction.

(2) Color: On Chinese funerary vases the color red, as the color of blood, life, and fertility, was supposed to give the deceased some magical help toward resurrection. In many other cultures red has been used as a protection against evil spirits. Red remained an arbitrary symbol of warmth and life, even when no magical power was ascribed to it. Finally, red became the warm hue in the color scale, in contrast to the cold colors, and was used in contexts quite contrary to the magical and symbolic meaning.

(3) Adornment: In primitive societies and ancient cultures parts of the body, for instance the neck and wrists, were magically protected by amulets (PLS. 248, 249). Since these also had a decorative effect, the metals and precious stones used for magical purposes were all the more acceptable because of their beauty and were often elaborately worked for esthetic enhancement. Today the wearing of "charms" is merely a game, though the magic remains in a generalized erotic sense.

THE ICONOGRAPHY OF MAGIC FROM ANTIQUITY TO THE MODERN WEST. *Prehistory and the ancient Near East.* The magician or diviner, with his peculiar states of consciousness, is a favorite theme in the history of the visual arts, not for the purpose of working magic but as illustration or allegory. Naturally this is especially true in religious contexts treating of miracles, for such stories from the Gospels and the legends of saints comprise a large sector of Christian art. However, the iconography of such religious art works is pertinent here only when the miraculous nature of the event is emphasized in a way that presents the paranormal in the magical sense. Thus the principal emphasis here will be placed on representations that fall outside the Christian tradition of miracles and have been of some importance in antiquity or in Western art since the end of the Middle Ages. The Magdalenian cave paintings and rock engravings mentioned above seem to reveal not only a magical and cult purpose but also a certain artistic pleasure in the representation itself and in the skill of execution. The magical motifs so often chosen for illustration are significant: dances (probably with sexual magic) and magicians themselves (comparable to the shamans and medicine men of modern primitive cultures). The magicians appear in animal masks and even in animal costumes to stalk the creatures of the wild, either as part of a mime or in the hunt. These representations are the earliest instance of the ominous and fear-inspiring picture of the magician discharging his proper function, which has always had an exciting influence on the imagination of humanity. Thousands of years later, in the ancient Orient and in Egypt, as in Greek and Roman art, this figure approximated more the idealized type of the priestly sage. An enormous number of images of magical, mythical, and cult significance are encountered in Mesopotamia, with its astrological beliefs, and in ancient Egypt, which was known to the Greeks as the classic land of magic (and later of alchemy) and was revered for its hieroglyphs, which were for centuries thought to be the secret writings of a lost mysterious wisdom. However, most of the images were magical in intent and were not meant for the eyes of the living. In ancient Egypt, for example, the representation of the god Horus as a child, standing upon two crocodiles and suffocating a group of serpents with his hands, is frequently found on healing steles and statues (PL. 250). Mesopotamian objects often bear scenes of exorcism, though the extent of the intended magic factor is not easily determined. One such object is a bronze bell in Berlin (Staat. Mus.) showing a group of exorcists, priests of the god of magic Ea, who hold buckets and are wrapped in curious capes that give the figures a fishlike appearance. Near them appear lion-headed demons and a human figure, possibly a beneficent demon. Another such scene occurs on a terra-cotta slab divided into five strips, with several rows of *orans* figures; the subject of the exorcism lies on a mattress on the earth, while another figure stands upon a boat. The same fundamental motifs are found on a bronze plaque (Paris, Coll. De Clercq). On the reverse side is the back of a demon with the body of a winged lion; his head projects above the plaque, so that it forms the top of the scene shown on the obverse side.

Greece and Rome. In the ancient Near East, stories about sorcerers were less important than the construction of magical instruments, and in ancient Hellas, as discussed above, the magical intention can be fully recognized only in the earliest phases. In the classical centuries magic was only a recollection. On the other hand, the miraculous entered the picture. In Hellenic religion the divine powers were for the first time in human history represented in a bright and cheerful way, but the opposite pole, the nocturnal and sinister, was not absent. The figure of Hecate (of Near Eastern origin) became the focus of everything that was later to survive in folk belief and poetry in connection with ghosts, spirits, the wild hunt, and Thessalian

witches. Artemis, Selene, and Persephone, mistress of the underworld, also originated from this complex of ideas. There was also much magic in the Orphic-Dionysiac cycle of myths, with its mysteries, transformations, and representations of the other world in terms of soul birds, harpies, and sirens. Of human warlocks and witches, Medea is the classical prototype. More healthy, but often tragic, is the magic of seers and seeresses, as described by Homer. The belief in the clairvoyant gift of a Calchas, Tiresias, Cassandra, and many others endured throughout the ancient period. In real life, in addition to the renowned oracles that survived for centuries in the face of philosophic and scientific doubts, there were various highly developed methods of interpreting signs, combining definite regulated observations with inspirational means.

Many of these beliefs left their traces in the visual arts of the time, though examples are often missing in many fields today. The gloomy and chthonic element is often strongly in evidence in Etruscan art. In the graves of the late period the horrific side of the classical picture of Acheron and Hades is emphasized, and certain descriptions of the underworld seem like precursors of Christian scenes in hell by Bosch and Grünewald (qq.v.). Commonest are pictures of divination, which are particularly interesting in that many motifs of this kind occur again in the art of the Renaissance.

Illustrations of seers in the ecstatic style that became frequent in the later Middle Ages are rather rare in ancient art. The figures in the Tomb of the Augurs in Tarquinia are probably not those of seers. However, there is no doubt that this subject is intended in a few vase paintings and in the figures of two old men from the east pediment of the Temple of Zeus at Olympia. These figures are especially remarkable because ancient sculpture at that preclassical stage was struggling to express the emotion of the diviner. One of the figures is sunk in a self-searching attitude of meditation, and the alert expression of the other is also to be interpreted as visionary, rather than as the augur's gaze or mantic observation of the flight of birds. At a much later stage the same facial expression of the seer occurs in the enthroned goddess with the child Triton in the Museo Nazionale Romano, Rome. On the basis of coins, this figure has been explained as the *thea sibylla* and therefore a copy, if not the original, of the statue taken to Rome from the tomb of a sibyl in the famous grotto of the sacred well at Erythrae in Asia Minor. The peculiar attitude, and even more the indication of the ecstatic glance (the sculptured pupils), marked the utmost expression of the transcendental in ancient art, because while the enchantment of music was familiar to the period, the transcendental as revealed to the ascetic seer remained closed to it.

Haruspicy, the prophetic observation of entrails and other phenomena, is quite frequently reflected in Etruscan art. As examples there are the bronze sculptures in Piacenza (PL. 253) and in the Vatican Museums, the wall paintings from Golini Tomb II at Porano, near Orvieto, and a magnificent engraved mirror from Tuscania (last two, Florence, Mus. Arch.).

Another favorite subject was catoptromancy, the widespread practice of inhibiting consciousness by staring into reflecting surfaces such as mirrors, crystals, and water vessels and so obtaining true visions from the subconscious (as we should say nowadays) or from gods and demons (as they said then). On an Attic vase of the late 5th century B.C. in Berlin (Staat. Mus.), depicting Themis and Aegeus, this method of divination even appears to replace the Delphic oracle. Lecanomancy is introduced in a Dionysiac scene in the Villa of the Mysteries at Pompeii (PL. 246) and in genre paintings in the frescoes of the House of Livia in Rome. The remarkable examples of divination from mirrors shown on the four reliefs of the silver treasure of Berthouville (Paris, Bib. Nat.) have not yet been reliably interpreted in detail.

The interpretation of the stars and the casting of horoscopes by astrologers were familiar subjects to Hellenistic and Roman artists. There are numerous extant sarcophagus reliefs with such representations: Prometheus, the outline of the career of a high official, the birth and education of a child (e.g., Uffizi, Louvre, and Villa Doria-Pamphili, Rome). The mosaic of the philosopher, from Torre Annunziata, near Naples, with a ball erected on a plinth, must also be mentioned here. The personal horoscope found its most elaborate manifestation in antiquity in the funerary monument of Antiochus I of Commagene at Nimrud Dagh, Anatolia.

Christian art until the end of the Middle Ages. Although within the limits of Christian art an apotropaic undertone was officially no longer allowed, it survived in the earlier Middle Ages in sculpture and ornamentation, especially in Romanesque churches. Moreover, certain pagan and magical elements appeared to an increasing degree, in a manner that combines freely illustrative and old apotropaic intentions.

In the last centuries of the Middle Ages there were an increasing number of representations from the pictorial repertory of the calendar and ancient and Arabian astrology (illuminated manuscripts, frescoes, and tapestries in palaces, town halls, and other public buildings). Originally the traditional signs of the zodiac and occupations of the months, as they appeared on floor mosaics in late Roman, Early Christian, and early Romanesque buildings, and ultimately among the Christian representations on the walls and west fronts of Gothic cathedrals, were merely calendaric; they illustrated the sun's position in the zodiac simultaneously with the relevant occupations on the land and the activities at court.

Magic was involved only in so far as ultimately all representations of stars and constellations from the mysterious Arabian sphere stirred the simple-minded to a pious shudder. In consequence, in engravings and tapestries the zodiac became less and less important, and finally only the agricultural work of the seasons remained. On the other hand, the seven planetary gods provided abundant material for superstitious subjects and symbolism and in the Christian Middle Ages became fantastically garbed demons. The sacred number seven was brought into relationship with other things that went by sevens, such as the liberal arts, the virtues and vices, metals, musical notes, and the ages of man. Examples can be found in the reliefs in the Campanile in Florence (after Giotto), in the Spanish Chapel in S. Maria Novella in the same city, and at the Church of the Eremitani in Padua — all of the 14th century. Giotto, whose interest in this basically non-Christian subject has attracted very little attention, also worked in the Palazzo della Ragione in Padua, the center of the study of astrology as a university subject. One of the professors there was Pietro d'Abano, who has been called "the Paduan Faust of the Middle Ages" (Warburg). Giotto painted, or had painted by his pupils, an enormous compendium of astrology, giving the signs of the zodiac with the corresponding occupations of the months, the supernatural influence of the planets on men born under them, and the Egyptian decans and paranatellons, from which the beholder could read off his fate. Unfortunately the renowned Salone in the Palazzo della Ragione, which was a place of pilgrimage to all interested in magic, was severely damaged by fire not long after its decoration; what remains, with the early-15th-century wall paintings (II, PL. 27) mentioned by Paracelsus, can hardly be regarded as a restoration or even a copy of what has been lost. It is uncertain whether this work should be regarded as a vast horoscope of the city or just a monumental primer of astrology. Perhaps the influence of the stars, because their courses in heaven are unalterable, seemed an especially suitable subject for a hall of justice.

About the same time the sister study of alchemy, which laid more stress upon active magic, was developing its own secret language of hermetic hieroglyphs. The signs were chiefly derived from Arabic prototypes and cannot certainly be traced except in the painted and, later, printed treatises. It is not established whether, as is frequently asserted, certain ecclesiastical sculptures represent not only calendrical subjects but also allusions to the magical (and therefore basically heretical) art of purification.

Christian representations of the early Middle Ages retain remarkable traces of Celtic and early Germanic paganism, which had been repressed into the subconscious. In Irish book illuminations of the 7th and 8th centuries, which are

works of fine monastic art, not only the ornamentation (a labyrinthine synthesis of animal motifs, ribbons, and spirals) but also the stylized and imagelike figures of saints seem deliberately intended to arouse feelings of dread (see ANGLO-SAXON AND IRISH ART). This is also true, *mutatis mutandis* and on the crafts level, of much ornamentation of the early Middle Ages (Romanesque capitals; IV, PL. 178). The desire for magical protection survived in combination with the illustration of fables and often came from the heathen world of saga, but it was presented in a way that left open to the beholder a more ecclesiastical and Christian interpretation.

The sculptures, book illustrations, and wall paintings of the early Middle Ages often show on the part of the monastic artists and their patrons a marked preference for stories of miracles (see SAINTS). Tales of healing, exorcism, and the like, taken from the Gospels and the legends of the saints, were presumably chosen because they were especially convincing to people only superficially Christianized. Such pictures usually make the gestures of Christ, the apostles, and saints so emphatic (in blessing, exorcising, and raising the dead) that the distinction between magic and miracles or saint and magician is quite lost. In the early Gothic period this characteristic gave way to pious and mystical devotion, only to recur at the end of the Middle Ages on another level.

There were many transitional stages between the mystical attitude, which was introspective and selfless, and the magical attitude, which was driven by a secret will to power and became more strongly emphasized as the Church's rule became more lax in the 16th century, the period of the German magician Dr. Faustus (Faust). Gothic religious art showed a particular interest in the phenomenon of clairvoyance, which was barely hinted in the ancient period, developing further the subject of the Old Testament prophets and the pagan sibyls by then adopted into Christian iconography. The best-known example is probably the figure of St. Elizabeth in Bamberg (VI, PL. 360), sometimes called the "Bamberg Sibyl," actually a representation of Elizabeth prophesying to Mary (the Visitation). Giovanni Pisano, Jacopo della Quercia, Claus Sluter, and many wood carvers of the late Gothic period were also masters of the representation of the clairvoyant state. Clairvoyant gifts, which are attributed to Wisdom in the pseudepigraphic Wisdom of Solomon, were also attributed to Prudence, one of the seven virtues. Giotto seems to have been the first to give Prudence (Padua, Scrovegni Chapel), besides the traditional serpent, the attribute of the mirror, not as a sign of self-knowledge but as as a symbol of catoptromancy (see also PL. 255).

Magic as a "Faustian" subject: a. "Romanticism" about 1500. With the general psychological shift that accompanied Humanism, the Renaissance, and the pre-Reformation, there occurred in northern Europe a phase which Wilhelm Pinder called "the romantic period in German art about 1500," but which might be more exactly described as the "Faustian-Paracelsian" period of magic in art (PLS. 254, 258). This conception corresponds to the formal characteristics of the late Gothic period noted above. In the work of Grünewald (q.v.), the younger Cranach, and the Danube school (Altdorfer, Wolf Huber) the mystical golden background was replaced by a new naturalism in the representation of earth, plants, and atmosphere, not only in accurate detail but also with a certain suggestion of animism. Even Biblical miracles and legends of the saints were transmuted into dream and fairy-tale terms, sometimes even into those of panic, demons, and the occult. Grünewald surrounded the resurrected Christ with an unearthly aura (VII, PL. 89), which is perhaps to be understood as implying Docetism; Altdorfer placed Christ's birth in a chthonic cave and made the star of the Wise Men into a cosmic phenomenon (I, PL. 61). These tendencies carry through Adam Elsheimer to Rembrandt, whose mysterious dualism of light and shade, with his clairvoyant understanding of the forgotten world of the Old Testament, suggests that perhaps he personally frequented the company of cabalistic adepts. The mannerist "Monsù Desiderio" (V, PL. 240), with his feverish theater of dreams, was a contemporary of Rembrandt.

b. The myth of the magus. One of the principal symptoms in this mysticism is the image of the philosophical magician, who represents "white magic." This archetype appears in all sorts of costumes and disguises. One of the commonest of these, and a favorite dream of the Renaissance, was that of Orpheus, with his animals enchanted by music. Many "great initiates" of early times appear, including astrologers, geomancers, and alchemists (e.g., Hermes Trismegistus by Giovanni di Stefano in the pavement of the Cathedral of Siena), sometimes in general gatherings (*turbae philosophorum*), sometimes in groups of three, and occasionally singly, as in Rembrandt's well-known etching said to represent Dr. Faustus in his study. There are also the more ambiguous representatives of paganism in late antiquity, such as Hermogenes, Apollonius of Tyana, and the really wicked figures of magic. Dosso Dossi designed at the court of Ferrara a romantic theater based entirely on the cycle of magical symbols and specialized in paintings illustrating the splendor of Circe. Simon Magus (mentioned in the Acts of the Apostles and in the New Testament Apocrypha) was represented in competition with the wonder-working apostles (Bruegel; q.v.). Hieronymus Bosch (q.v.), who was probably the most conspicuous exponent of the new trends in magic and always in the ambiguous position of being partly a critic and partly an unacknowledged member of the circle, put a rather suspect sorcerer in the background of Christ's miracle of the wine and water (*Marriage at Cana*; Rotterdam, Mus. Boymans-Van Beuningen). In his *Temptation of St. Anthony* (Lisbon, Mus. Nacional de Arte Antiga) he included among the ordeals of the saint a Black Mass, as a satanic antithesis to the miracle of transubstantiation of Church doctrine. In addition to these there are many depictions of more trivial kinds of charlatanism of all types, such as Bosch's *Conjurer* (II, PL. 319).

c. Homo divinans. The face of the diviner or clairvoyant, which in antiquity was barely indicated, became in the late Middle Ages fully developed, and the traditional mantic procedures remained of interest as late as the 16th century, when the transcendental interpretation gave way to a no less Paracelsian view of nature. Lucas Cranach (q.v.) provides an excellent example in his attractive early portrait of the Faustian Humanist Johannes Cuspinian (IV, PL. 46). Albrecht Altdorfer, in a work in the Munich Alte Pinakothek, represents the two Johns, the prophetic baptist and the apostle of the Apocalypse, surrounded by miraculously healing herbs, like two masters of natural magic with Paracelsian emblems of the old medical doctrine of signatures. The portrait art of the 15th and 16th centuries is based partly on the study of horoscopic temperaments and partly on the utility of physiognomy as a guide to the intuitive study of mankind (cf. Hans Wechtlin's illustrations to the physiognomical writings of Johannes de Indagine). Crystal gazing and divination by mirrors, as well as lecanomancy, hydromancy, and geomancy, were favorite allegories in Renaissance painting. Examples include works by Giovanni Bellini, Giorgione, and Titian [the sibylline *Vanity* (Munich, Alte Pin.); the so-called "Allegory of Alonso d'Avalos" (Louvre), with reminiscences of I Cor. 12, 13; and the *Sacred and Profane Love* (VII, PL. 382), which is more probably a richly varied version of the subject of the love oracle]. In the 17th century the *homo divinans* took a less conspicuous place. Rembrandt is once more an exception, not only because the atmosphere of dream and divination is found in the whole of his work, but especially because of the famous etching mentioned above, which was described by a contemporary collector as a "practicing alchemist." This description cannot refer to the making of gold, since there is nothing of this to be seen in the etching; it must therefore refer to Rosicrucian or cabalistic esoterism. The connection with Faust was not mentioned until the 18th century. On the other hand, alleged clairvoyants continued for a long time to be satirized. They often appeared in the work of Hieronymus Bosch and later became, with other charlatans, type figures.

d. Astrology. The above-mentioned appearance of astrological subjects in the 14th century was a mere prelude to the expansion of this magical idea during the Renaissance proper.

Of course, the personifications of the planets gradually lost their fantastic and demoniacal magic and mystery when Humanistic logic had liberated them from their half-Oriental, half-Gothic disguise and restored them to their status as classical gods. (See also ASTRONOMY AND ASTROLOGY.) Fifty years after the renovation of Giotto's completely hieroglyphic fresco in the Salone of Padua, the frescoes in the Palazzo Schifanoia at Ferrara were executed for Duke Borso d'Este; they were completed in 1470 by Cosimo Tura, Francesco del Cossa (qq.v.), and others. Here, too, the superstition of being the child of a planet is combined with the zodiacal subject of the occupations of the months, but here the paintings have no magical purpose, as at Padua, but are simply illustration, even though they display much Humanistic-Gnostic learning and make much play with mystery. In the highest register the Olympian gods appear, accompanied by their planetary emblems; their triumphal cars are surrounded by worshipers drawn from the court circle of the Duke, who is himself represented as a child of Venus. The occupations of the months (IV, PLS. 1–3, 5) are represented in the middle register and are rendered in courtly terms, as are those in Burgundian calendar paintings. In the lowest row, however, where the signs of the zodiac appear with the images of their three decans (II, PL. 25), the old-fashioned masquerade and the powers of the planets win out. Raphael shows no knowledge of fancies of this kind in the mosaics in the Chigi Chapel of S. Maria del Popolo in Rome. He simply shows the classical gods of the planets with their guardian angels in flight around the image of God the Father, realizing thereby the ancient ideal of a Christianized astrology. In Germany the same gods, with the personified virtues attributed to them, appear on the façade of the Ottheinrichsbau (1556–59) at Heidelberg; the elector Otto Heinrich himself, as builder, occupies a portrait medallion in the center and has above him as his patrons Charity and Venus, heavenly and earthly love.

Along with learned syntheses, as in Padua, Ferrara, and Rome, the theme of children of the planets, which had occasionally appeared at the end of the Middle Ages, occurred in more popular contexts. In composition the occupations of the months continued to provide the basic scheme, but the zodiacal sign in the sky is replaced by the planetary ruler in his triumphal car, and instead of the terrestial occupations, the typical destinies and professions of persons born under the relevant planet are shown. Illustrated manuscripts of this kind, usually with explanatory verses, are to be found, for example, in the libraries of Modena, Ulm, Kassel, and Tübingen (where a weird jumble of demoniacal accompanying constellations surrounds the sign of the zodiac that is the "house" of the planet in question). A more aristocratic impression is created by the sketches of the Housebook Master, in which these destinies and activities verge on genre painting. The subject of planetary types [always adapted to the latest fashion and taste, as in woodcuts by Georg (Jorg) Pencz, etchings by Saenredam, and many others] was also popularized in broadsides with woodcuts and etchings illustrating predictions, pestilences, droughts, wars, and peasant revolts to be expected from imminent planetary conjunctions.

Monumental representations were rarer, the best example being, of course, the summarily executed ceiling paintings of Pinturicchio's school in the Borgia Apartments in the Vatican (XII, PL. 34) — a remarkable example of pagan superstition in the papal palace. In the early 17th century the carpetmakers of Flanders sometimes produced, in addition to their favorite theme of the months, carpets illustrating the planets, but then this subject disappeared completely. The influence of the planets on their children was supposed to be strongest in respect to temperament (see CHARACTERIZATION). Frequently, as in the castle at Heidelberg, the personifications of the temperaments were represented in association with the appropriate planetary gods, but the connection is noticeable even when such explicit mention is not made. Thus, in the very popular representations of Melancholy (by Dürer, Cranach, and others), the esoteric Humanists distinguished an elite of Saturnians from the common children of Saturn. Dürer's engraving *Melencolia I* (III, PL. 203) combines the attributes of both the esoteric and exoteric Saturnine influence. The allusion seems to be to the first grade of melancholic divination, as it was distinguished by Marsilio Ficino and Agrippa von Nettesheim (according to Panofsky). Presumably the artist originally intended also to illustrate allegorically the second and third stages. All three grades appear in summarized form in Giorgione's *Three Philosophers* (VI, PLS. 190, 191).

The existence of apotropaic (or horoscopic) zodiacs in Egyptian temples (Dendera) may have become known to the enthusiasts for Egyptian wisdom quite early. The constellations in the small dome above the altar in the Old Sacristy of S. Lorenzo in Florence seem to refer to the stellar configuration on some particular day; so do those of the Pazzi Chapel, though the day indicated was probably not that when the altar was dedicated but more likely that of the Ecumenical Council of Florence (1439). However, even this would be an almost blasphemous combination of Christian and astrological beliefs. Agostino Chigi commissioned Baldassare Peruzzi to paint for him in his summer palace on the Tiber (the Farnesina) a personal horoscope with well-developed astromythological motifs (XI, PL. 119). Probably also the above-mentioned Ottheinrichsbau at Heidelberg contains references to a personal ideal or idealized horoscope of the builder.

Horoscopes as genre painting are found in the work of Giorgione and his imitator Vincenzo Catena, who, perhaps having knowledge of ancient example, painted scenes of this kind in the lofty style of hermetic romanticism, though none survive except a poor copy in Dresden. Similar subjects are found on boxes made for pregnant women, on majolica cups, and in popular woodcuts.

Mythical idealized portraits of the great initiates of astrology and alchemy occur frequently among the representations of *homo magus* and *homo divinans*. The subjects of Giorgione's *Three Philosophers*, for example, are idealized types who possibly represent the three degrees of a secret society. Classic examples are Ptolemy and Zoroaster in Raphael's *School of Athens*.

Examples of portraits with astrological allusions, such as indications of the birth constellations, horoscope schemes in the sky, or even bare indications of the celestial influences, either in the landscape or in amulets worn by the person depicted, are found in the works of Lorenzo Lotto, Dosso Dossi, Giorgione, Wolf Huber (portrait of Otto Heinrich, private coll., U.S.A.), Beham, and Lucas Cranach.

e. Alchemy. Representations of hermetic lore are partly illustrative and partly symbolic (PLS. 259, 260).

(1) Alchemists at work (pictures of men at work, idealized portraits, genre pictures, and satire): As early as the 14th century Petrarch and Chaucer gave satirical descriptions of the activities of adepts, though Gower believed there was a lost truth in alchemy. Thereafter makers of gold were included among the crew of the Ship of Fools. From this use and by way of the woodcut illustrations to Petrarch's *De remediis utriusque fortunae*, the subject of the alchemist soon found its way into drawing and painting. The maniacally obsessed toiler, with his weird concoctions and equipment, surrounded by huge books, his despairing wife, and his pseudolearned adviser, who leaves it to others to dirty their hands at the furnace, is vividly illustrated in a drawing attributed to the elder Bruegel (Berlin, Staat. Mus.). The subject survived for its picturesque value in genre paintings by Jan Steen, Teniers, Ostade, and others. It is also found in the *studiolo* of Francesco I de' Medici in the Palazzo Vecchio at Florence, where the Grand Duke is represented by the Flemish painter Stradanus (Jan van der Straet) as engaged in secret alchemical work; this, of course, has no satirical overtones. In the 17th century Thomas Wyck (Wijck) counteracted the more satirical pictures of his painter colleagues with a more romantic style of Faust representation in duodecimo format.

(2) Symbolism: From the first the adepts concealed the secret of the philosophers' stone behind a variety of metaphors which, in the later Middle Ages, were at first verbal (presumably taken from treatises in Arabic) but later were made visual. Manuscripts and printed treatises on the "royal art" gave secret instructions for hermetic practices and were illustrated

with dream allegories, symbolic figures, and emblems taken from nature, the amorous life, and pagan mythology, as well as occasional Christian subjects. The purification of the *materia prima* was actually compared to the Passion of Christ and His sacrifice (Lapis = Christus). Not many manuscripts have survived from the early period (14th–early 16th cent.): there are a few codices in Florence, the *Aurora consurgens* (Cod. Rhenoviensis, Zurich, Zentralbib.), the *Opera chemica* of Pseudo-Lully (Florence, Bib. Naz.) with illuminations by Girolamo da Cremona, and the *Book of the Holy Trinity* and *Splendor solis* (Berlin, Kupferstichkabinett, and Nürnberg, Germanisches Nat. Mus.). Many survive only in modern imitations, either in the current style of copper engravings or drawn and painted.

(3) Hermetic romanticism: Alchemy stimulated the poetic inspiration of certain painters. In the puzzle-pictures of Hieronymus Bosch, which are the principal evidence for the new encounter between magic and art at the end of the Middle Ages, there are many reminders of the work of the adepts who hoped to hasten the task of nature in their glass retorts. In Venice, too, that semi-Oriental city of mosaicists and glass-blowers, painters showed the deepest interest in the mysteries of making gold according to the "royal art." Certain subjects in works by Giorgione and Giulio Campagnola, who was a friend of Giovanni Aurelio Augurello, a writer of alchemical poetry and member of the Florentine Academy, can be explained only in terms of the hermetic feeling for nature combined with a delight in pastoral scenes.

f. The mysteries of hieroglyphics. Dürer provided a set of illustrations for the text of Horapollon, which had been rediscovered as early as the 15th century; the woodcuts illustrating the great novel of initiation which is known as the *Hypnerotomachia Poliphili* (I, PL. 308) originated in the circle of Bellini. The whole study of enigmas, rebuses, and emblems, from the Renaissance on, had its origin in the study of these Egyptian hermetic symbols.

g. Demons. A great deal of folkloristic animism was included in the magical representation of the world, including the belief in benevolent nature spirits and the possibility of dealing with them (as with Ariel in *The Tempest*, and in Goethe's *Faust*). Evil demons, devils, and ghosts, however, were more frequent; the original apotropaic intent of such representations eventually gave way to pure illustration. In Christian sculpture the devil's face, or mask, is the polar opposite to the angelic realm of light. The physiognomy of demons, so amply represented in ancient Etruscan art and in India and the Far East, was most highly developed in Christian art in scenes of the Last Judgment and the Temptation of St. Anthony. In the late Middle Ages there was a whole range of expression which exceeded the normal bounds of fantasy. Bosch owed his reputation as a "faiseur de diables" to his representations of hell, which frequently diverged from the traditional ones; but this subject did not exhaust his invention, since he was at home with all types of esoteric and exoteric magic. This does not imply that he was identified with any obscure sect or took orders from any secret group. His paintings should rather be interpreted as a conscious exposure or as a lampoon of this repressed sphere, even if the artist felt a subconscious "hate-love" or attraction toward it. It is quite likely that Grünewald — whose Isenheim altarpiece depicts the Temptation of St. Anthony (IV, PL. 180) and the Resurrection (VII, PL. 89) mentioned above — had seen pictures by Bosch and just as likely that Giorgione, whose pastoral idylls also had a demonic nocturnal quality, knew Bosch's work.

h. Witches. Representations of women who believe themselves to be possessed by the devil, and hence endowed with magical faculties, must be distinguished from those of enchantresses of a higher type. Witches were depicted as early as Bosch, and the elder Bruegel, in his period, enriched the subject with horrifying references to it, particularly in his etchings. It is hard to understand how such a dangerous subject could become the theme of works of art at the very time when witches were being persecuted. Nevertheless, Dürer's very clever pupil Hans Baldung-Grien made a specialty of depicting witch congresses and Walpurgis Night gatherings, representing his witches as fleshly bacchantes of heathenish abandon (PLS. 255, 257). The subject of witches lasted far beyond Baldung-Grien and Bruegel. In the 17th century Teniers and Salvator Rosa (PL. 256) treated it in a more matter-of-fact manner, and Goya, though intellectually a child of the Enlightenment, as an artist showed a perverse passion for scenes illustrating the witch mania that took so long to die out in his Spanish homeland (IV, PL. 181; XII, PL. 315).

i. Romantic occultism and surrealism. The occult undercurrents that flourished during the century of the Enlightenment (secret societies, Egyptomania, Cagliostro-like frauds, Rosicrucians, Illuminati, and Freemasons) seem to have made an impression on art only in sporadic cases, in contrast with their influence on the novel, the theater, and opera. Tiepolo, in his series of etchings called *Scherzi di fantasia*, found a light and playful subject in the magical practices of Venice; Goya, in his *Disparates*, extended his imagination to the darkest and most gruesome aspects of black magic.

In England at the beginning of the 19th century, the Swiss Fuseli (Johann Heinrich Füssli; q.v.) excelled in ghostly dream scenes of exaggerated pathos. Fuseli's friend William Blake returned again and again to eidetic visionary subjects and magical allusions (X, PL. 252). His Biblical motifs are derived from a peculiar esoteric and theosophical tradition that was often ecclesiastically unorthodox.

In the 19th century, while historical idealism was giving way to a more realistic and impressionistic way of looking at things, the magical undercurrent did not entirely disappear. On the whole the romantic artists, unlike the poets and thinkers, avoided it. Not till the turn of the century did the neoromantic movement begin to employ symbolism and elements drawn from the field of magic, and even then, for the most part, only as esthetic stimulation.

Joseph Péladan and his Rosicrucian revival drew inspiration, though again chiefly esthetic, from the allegorical inventions of Ferdinand Hodler. The inner relationship to magic was more profound in Odilon Redon. A personal friend of the Parisian impressionists, he based his art on dreams and visions (XI, PL. 371), which he nourished with spiritualistic esoterism, especially inclining toward the neo-Buddhist thought of Theosophy. Later his fantasies inspired Alfred Kubin, who tried to appease his neurasthenic anxiety about fate, first with gruesome surrealist allegories, and then later, more successfully, by plunging into traditional German pantheism. The true surrealists, such as Max Ernst (q.v.), turned with interest to Gnostic philosophemes, and show a kinship with the manneristes of the 1600s and their quasi-magical estheticism; with this they mix skepticism, a desperate irony, and agnosticism. The old, traditional subjects, with their demons and other weird ingredients, were thrust aside to make way for a new kind of acausal alienation in which the world of appearances is entirely disintegrated.

Gustav F. HARTLAUB

ASPECTS OF MAGIC IN ASIA. In the Asiatic world the division between magic and religion is tenuous; psychological attitudes peculiar to the *homo magus* of the West are essential for the Asian priest, and the gods themselves assume values that are in many respects traceable — sometimes even avowedly so — to magic. What with the techniques of meditation and ecstasy (such as yoga), paranormal experiences, and other less easily definable phenomena, many concepts that form an essential part of Western magical tradition belong to religious tradition in Asia, sometimes with a complete parallelism of techniques, as in the case of the magic formulas (mantra and dharani) adopted by later Buddhism, Saivism, and generally by all the Tantric cults. Thus certain legendary motifs, which in the West never altogether belong to the religious tradition and are closely bound to the tradition of magic, are absorbed in the religious thought of Asia (for example, the characteristic motif

of lost objects that must be recovered and kept safe). The Western tradition of the Holy Grail and the Iranian tradition of the *xvarnah* constitute a case in point. With reference to the gods, all the way from Enki of Eridu (magician-god par excellence) to the Vedic Varuṇa (typical dread sovereign of Indo-European mythologies), and to the meaning attributed from the most ancient Indian tradition to sacrifice (which can sway the will of the gods, thereby placing the priest at the summit of universal power), a whole scale of nuances diminishes the difference between magic and religion in Asia. Moreover, the so-called "folk" survivals, reflecting beliefs that coexist within a single society at different social levels, assume in Asia different characteristics from those of the West (see FOLK ART). For this reason, also, the divergence between magic and religion in the Western point of view is considerably attenuated and often disappears completely in the East. Thus the theory of Arnold van Gennep (*Les rites de passage*, Paris, 1909), which regards the magical and the religious as an indivisible unity, distinguishing solely between theoretical (religious) and practical (magical) activities, would seem in its general lines to be valid for the Asiatic world.

In any event, the selection of artistic material pertaining to magic in Oriental cultures depends on the definition of the term "magic." This initial choice of standpoint — however difficult it is made by the variety and persuasiveness of the different theories — must be modified by taking into account the different views held by other civilizations and cultures of what is considered magic, for example, the semantic value of the various words indicating "magic" in the diverse languages.

Broadly speaking, magic may be defined as the use and mastery of those mysterious forces which act by hidden and apparently irrational means. Such forces, often expressing the will of either gods or demons, may be discerned and put to use even by man. Very often the magical element is distinguished from the religious in that the former represents a "wicked" and terrible means of dealing with these hidden forces. An Asian example confirming this interpretation may be found in the *Sakkasaṃyutta*, part of the *Saṃyuttanikāya* (I, 216–40), a well-known Buddhist text in the Pali scriptures, in which Sakka (Skr., Śakra, or Indra) begs Vepacitti, king of the asuras (demons or titans), to instruct him in the magical art, offering to heal him in exchange. Vepacitti, after taking counsel, refuses on the grounds that this art leads those who practice it to the infernal abyss. The episode demonstrates that Buddhist thought long retained Vedic traditions, such as this, for example: that magic was an art belonging to the asuras, opponents of the devas (gods). The refusal of Vepacitti would seem strange, except that the apparent solicitude on the part of the asura king for the salvation of the deva king actually indicates nothing but his determination to keep Sakka out of his personal domain by every means.

Magical objects, in the East as well as in the West, are often at a relatively low level of artistic value. Amulets and talismans, more or less complex geometric figures drawn in ink or by other means, are usually important only for the accuracy of their execution or for the exact inscription of formulas and names. In these, the esthetic interest is secondary, and the workmanship may be hasty and rough, as is the case of the well-known amulets of the Islamic world. The artistic interest of drawn and written talismans lies in the calligraphy applied to magic formulas; here and there, as in the Buddhism of central Asia and northwestern India, magic alphabets were created expressly for composing formulas of evocation. Introduced into China with the expansion of Buddhism, such formulas, especially when they were written in alphabets currently used in India and central Asia, may — by the contrast between the foreign and the Chinese characters — have been impressive to the beholder, but such impressiveness is not truly an esthetic effect; the pleasure derived is rather that of complacency in an occult knowledge reserved to a select few, or the intimation of a supernatural power at the disposal of initiates.

Similarly, the products of the shamans and sorcerers of northern Asia are not intended to have esthetic interest. It is problematical whether the shaman, with his ecstatic techniques and his particular ability to travel in the heavens, in the lower depths, and on the bottom of the sea, should be considered as working solely on the magical level or also on that of religion (see SHAMANISM). The forces sustaining him and which he dominates incline many scholars to prefer the magical view, but it should not be overlooked that the shaman is acting first and foremost on behalf of society. In any case, the shamans' costumes (XIII, PL. 2), which imitate with great imagination the shape of a bird or its skeleton (the Yakut shaman), or have elements derived from birds (the Mongol shaman's wings; the Tungus shaman's boots with claws attached), together with the various ritual objects, all have a magical function, just as do the headdresses and aprons used in certain Tantric rites. The rattle is rarely of artistic workmanship, but the drums bear stylized depictions and ornamental bands (IV, PL. 262), and the magic bells display elements of artistic merit in execution. Chinese and Indonesian bronze drums derived from the shamanic drums and used (in rainmaking) in a function midway between magic and religion are frequently of high esthetic value. Incidentally, the symbols of the world of the dead painted on the magic drums of Lapland (IV, PL. 262) may be derived from the viking iconography of the same world, as seen on certain sculptured stones. The portrayal of shamanistic rites on hide or on birch bark, as well as on imported metalwork (the Sarmatian cup with sgraffitti; Leningrad, The Hermitage), has frequently an ingenuous but not inconsiderable value in its composition. It is not impossible that the Siberian shamanistic practice of attaching metal ornaments, plates, bells, and chains to their vestments may have given rise to armored breastplates and coats of mail, thus influencing the art of arms and armor (q.v.). Certainly, mail vestments and round armor plates remained in use among them until very recent times.

Related to the metal ornaments of the shamans and to their rites of sympathetic magic (linked to hunting and to the animal shapes assumed by the spirits on which shamanistic activities were based) are works of very great esthetic significance, such as those in the animal style, which spread throughout Europe (see ASIATIC PROTOHISTORY). The animal image may have, in certain cases, a perfectly clear symbolic and religious import, as conveyed by the ram in Persia and the bull in prehistoric India (see CERAMICS; INDUS VALLEY ART). In other cases the animal image is related to hunting magic, as in the bronze plaques of Ordos (q.v.; X, PL. 399), in those of Siberia, and in those of the Sarmatian era, which at times display genuine representations of complex hunting scenes.

Part of the metallurgic production of Eurasia has magical significance not only in the figural content but also in the magical function attributed to the artist in the various civilizations and cultures. Metallurgic technique, domain of the few, is by its ritual character often considered close to magic; in China, for example, the smith infuses a soul (that is, a life of its own) into the sword he is shaping. Somewhat similar to this is the Western medieval usage of giving a hero's sword a special name. However, the interpretation of the position of smiths and founders — although they were certainly initiates — is not entirely clear; recent theories tend to regard them as culture heroes, or participants in the process of creation, extraneous to the constituted order of the universe, and, in a certain sense, linked with the primordial chaos. Be that as it may, smiths and their works have a significance that can be defined as magical and derives in part from the magic power attributed to the metals they used. In addition, certain symbolic elements used on the objects (a certain type of Iranian ax, for example, has eyes) must have magical (or religious?) values.

Connected in origin with shamanism is the Tibetan Bon religion, in which magical and necromantic elements seem to prevail. The iconography and symbolism indubitably come from the reorganization undergone by the Bon religion through its contact with Buddhism and pertain, therefore, more to the religious than to the magical aspect. When Tibet, between 763 and 787, was converted to Buddhism (following the edict of K'ri sroṅ lde btsan, who proclaimed it the state religion), the exorcisms of Padmasaṃbhava culminated in the founding

of the temple of bSam yas, in sign of his victories over all the deities of mountain and valleys, who form "a sort of sacred geography of Tibet superimposed upon its physical geography and establish the most intimate connection between the land, the clan inhabiting it, and the ancestor from which the clan derives" (Giuseppe Tucci). The temple, reflection and synthesis of the universe, is a symbolic expression of the crushing victory of Buddhism over local religious elements, and therefore one cosmic order over another, which the Buddhists considered to be chaotic and somehow implicated in magic. Naturally, the temple itself displays the symbolism adopted from Buddhism, and thus only the erection of the temple can be considered a reflection of a duel between the "magic" world of Bonism and the religious one of the new faith.

The cult of the god Zhuni, the mysterious deity venerated at Zabul near Ghazni and elsewhere, was regarded by other religions as magical and demoniac in character. Both the Greek tradition of Theodorus Anagnostes, as summarized by Nicephorus Callistus (*PG*, LXXXVI, p. 202) and by Theophanes (*Chronographia*, ed. De Boor, Leipzig, 1883–85, pp. 163–79), and the Latin tradition of Victor Tonnennensis (*Chronica*, *Chronicorum minorum*, II, p. 194, no. 508, in *MGH*, *Autorum Antiquissimorum*, XI) speak of exorcisms accomplished by a Christian priest to assist in the conquest of a temple and its wealth by Kavādh I, a Sassanian ruler. Islamic tradition, too, in recording the conquest of Zabul by 'Abd-al-Raḥmān ibn-Samura, governor of Seistan, mentions the magic power of the castle and temple, although the victory is assigned solely to the Moslem leader's sword.

Within the definition of magic proposed above, it is possible to consider also works which are apparently religious in meaning, but which reflect conceptions that are somewhat at variance with the purely religious vision. For example, the iconography of the halolike *xvarnah* became, for the Iranians and the peoples under Iranian influence, the expression of royal power, but it may also be seen as an attribute of gods and demons. Another example is the symbolism of flames rising from the shoulders in the iconography of Kushan and other rulers, an element that seems more magical than religious in significance, even though the god of fire is an integral part of the Kushan pantheon. In the Avesta the *xvarnah* appears either as a personified god or, more often, as a luminous element of power desired and sought after as much by demons as by gods. The ambiguity of magic and religion is, here as in other cases in the Iranian world, not unlike the ambiguity that is at the basis of the word "magic": both the Greek μαγεία and the Latin *magia* derive from the Persian *magavan*, which originally stood for the doctrine and science of the Magi (a tribe inhabiting Media, according to Herodotus), well-known in antiquity for their knowledge as well as for their occult practices. Their exact identity has been much discussed by various scholars. According to Alessandro Bausani, the Iranian priests of Parthian and Sassanian times lost their former name of Atharvan (by which they were known in the Avesta) and took on that of *mogh*, or magus. Thus the magical element seems to merge completely with the religious, since the Magi, whoever they were, present the dichotomy of a highly elevated science and philosophy together with necromantic and peculiarly occult branches of knowledge. In India the symbol of the noose found in images of Kālī and Śiva passed into the iconography of Tantric Buddhism and is linked to the occult power of various deities, becoming the attribute of the "god who binds" and embodying magical power on the divine plane. The above-mentioned passage from the *Saṃyuttanikāya* shows that the Buddhist world (and previously the Vedic world) took a negative view of magic, relating it to the asuras. In theory, magic is proscribed by Buddhism, but only in so far as it is allied with forces and ideas that Buddhism itself tries to combat. The result is the irrevocable condemnation of all forms of magic related to everyday life and to ordinary wish fulfillment (love philters, magical means of harming others or protecting oneself from them, etc.). Nevertheless, a large number of practices that to Western eyes would seem magical are not only permitted but expounded by the very gods, by the chakravartins (universal rulers), and by kings; such practices come under the heading of *ṛddhi*, a term which Rhys Davids translated as "mystic wonder" and "magic power." In Buddhism, therefore, the distinction between magic and religion is expressible only in terms of the intent, orthodox or otherwise, that motivates specific acts, and the difference between the yogi and the fakir is only a difference of intent. The yogi is dedicated to attainment of spiritual liberation, while the fakir uses his powers for practical ends. It follows that all rituals concerning optative situations (*kāmya*), that is, such as are inspired by desires, can be considered magic, including prayers offered up to obtain favors.

In the Chinese world magic assumes a remarkable importance. The concept of magic remained for a very long time one of the essential elements of Chinese thought, and *chi* and *wu* (magicians and witches) had a definite place in ancient Chinese society. The denomination *chi* does not appear outside the oldest texts, but is replaced by that of *wu* and *wu p'o* ("sorcerers" and "sorcerers' wives"). The *chi* and *wu* most certainly had many points of contact with the shamans of northern Asia. From the art-historical point of view the ideogram *t'ao-t'ieh* (see ASIATIC PROTOHISTORY; CHINESE ART) may be understood as a depiction (in the shape of a monstrous and imaginary animal; II, PL. 10) of the primordial chaos from which was born the present order of the universe. In this there may be a reelaboration of a shamanic element and hence, as Carl Hentze believes (*Zalmoxis*, I, 1938, pp. 50–68), a magical significance. The use of jade for amulets is linked partly with qualities attributed to the material itself and partly with magical traditions from the regions where jade was originally procured. Shoulder bones of animals and tortoise shells used for divination, with the magical idea that the future, being revealed, can be corrected by human will, are of artistic interest only as regards the calligraphy of inscriptions. On the other hand, the trigrams and hexagrams mentioned in *I-ching* ("Book of Changes") could be used as ornamental motifs even in the decoration of architectural structures (for example, the so-called "sūtra pillars" from Turfan, formerly in Berlin, Mus. für Völkerkunde). The trigrams and hexagrams, derived from the cracks in animal shoulder bones and tortoise shells exposed to fire, were also used magically, because their interpretation made it possible to foresee adversities or propitious moments and to avoid the former and exploit the latter. Taoism (q.v.) has accumulated and preserved a remarkable heritage of magical concepts stemming from the communities of sorcerers, conjurers, oracles, and rainmakers which existed even in China's distant past.

The human body and anthropomorphic images may often have magical properties, though they too are difficult to distinguish from religious values. Rather magical than religious are those figures of deities that are considered to be endowed with life by the insertion in their hollow insides of various objects, such as mantras written on slips of writing material and passages from the holy texts. In some instances the wish to "animate" the image goes to extraordinary lengths, for example, in the celebrated *Śākyamuni* of the Seiryōji (commonly known as the Shakadō) in Kyoto, Japan. A hollow in the back of this figure contained money, other offerings, inscriptions and texts, as well as simulation of the Buddha's own entrails (in silk, with Chinese inscriptions and Sanskrit lettering) filled with various materials (incense, crystals, etc.). Here the effort to confer autonomous life on the statue is altogether clear, but the craftsmanship is of a high order, as for a religious work.

It remains clear that, because of the frequent lack of distinction between magic and religion, the magical purpose of a work influences its style only in certain examples such as the animalistic art of Eurasia and perhaps the composition of the Chinese *t'ao-t'ieh*. Furthermore the magician operates directly, without intermediaries, or uses the works of others and confers on them his own special powers, in which case there is no relation between style and the magical properties of the work itself; the two aspects are separate or linked in such a way that the esthetic aspect has less importance.

Only in Chinese and in Islamic art is it possible to find portrayals of conjurers at work, for example, the painting of Kuo Hsü, executed about A.D. 1500, which represents Han

Yü watching his nephew perform the peony trick (a variant of the Indian mango trick), and the 18th-century Persian miniature (Seattle, Art Mus.) in which the magician's costume is noticeably Westernized.

Islamic magic in general, called *siḥr* (a term apparently connected with the meaning of hallucination, confused vision, and fright), presents greater similarities to the magic of the West. It is based on the existence of the jinn and is a science revealed (Koran, II, 96) to the Babylonians by two angels who did not stop to think what a temptation this would be for mankind. There arose thereby a very complex theological question: whether and in what cases magic must be proscribed. It is of interest that the Solomon of the Koran tradition employs magical forces at will, and the magician in the *Arabian Nights* is most often a Moor. While magical articles from Islam (amulets, talismans, etc.) are of little esthetic interest, Arabic texts give the most accurate descriptions of magical techniques in use among the various peoples. Ḥajjī Khalīfa summed up the magic methods as follows: "The Indian consists in purification of the soul; the Nabataean in the employment of spells at suitable times; the Greek in compelling the service of the spirits of the spheres and the stars; that of the Hebrews, Copts, and Arabs in mentioning names of unknown meaning — this method being a variety of that by incantation, those who employ it professing thereby to press into their service the angels who have power over the jinn" (Khasf aẓ-Ẓunūn, ed. G. Flügel, London, Leipzig, 1835–58, III, p. 584).

MAGNASCO, ALESSANDRO. Italian painter (b. Genoa, 1667; d. Genoa, Mar. 19, 1749). He learned his art in the shop of his father Stefano, who was also a painter. Between 1680 and 1682 he went to Milan and stayed with a rich patron, who introduced him to the study of mathematics. Magnasco's inclination toward painting led his patron to apprentice him to the Venetian painter Filippo Abbiati. In this early Milanese period Magnasco painted some successful portraits, now lost. After some time, apparently abandoning portraiture, he turned his efforts to compositions with small figures and, save for a few exceptions such as *The Supper at Emmaus* (for the Convento di S. Francesco di Albaro in Genoa, now in the Palazzo Bianco), he produced this type of work for the rest of his life.

In Milan he met and became a friend of Sebastiano Ricci. In 1705 he left Milan for Genoa, where he attached himself to C. A. Tavella and collaborated with him; from there he went on to Florence, where he became court painter to the Grand Duke of Tuscany. The Florentine sojourn, punctuated by short trips in Tuscany and Emilia, ended in 1711, when Magnasco returned to Milan to remain until 1735, collaborating occasionally with Clemente Spera. Finally he established himself in Genoa and was active there until his death.

Despite the numerous and conscientious studies of Magnasco that have been undertaken, the origins and formation of his style have not been satisfactorily defined. On the basis of C. G. Ratti's statements regarding the painter's long formative residence in Milan and his known associations there, as student or coworker, with Filippo Abbiati and Sebastiano Ricci, the sources of his art have been sought in the Lombard mannerist environment (represented by Procaccini, Morazzone, and Crespi), with possible Venetian influences through the style of Ricci. Yet his Genoese point of departure should not be underestimated, for though Magnasco was quite young when he left for Milan, he must certainly have been exposed, through his father's studio, to the paintings of Valerio Castello, Giovanni Benedetto Castiglione (Il Grechetto), Domenico Piola, and Gregorio de' Ferrari, and probably also to those of Lucas and Cornelis de Wael. Lombard features are undeniably visible in Magnasco's work (perhaps transmitted by way of Ligurian masters, for example, Castello and Piola), but his essential style, allowing for pronounced personal inflections, expresses a Genoese character similar to that of Valerio Castello and Castiglione. Certain late works of Castello (such as *The Dead Christ Mourned by Angels*; formerly Genoa, Moro Coll.) and others by Castiglione (such as *The Crucifixion*; Genoa, Palazzo Bianco) support this hypothesis. The Lombard and Venetian contacts he had in Milan no doubt enriched his background, but they did not change his direction. Of more importance, though undocumented, is Magnasco's supposed encounter with works of El Greco, which he must, by some means or other, have seen. The similarities between the idiom of the two masters, allowing for difference in their temperaments and environments, are too evident to be mere coincidence; in both there is an exaggerated attenuation of the figures, and the spirit of the Counter Reformation inspired both, however diversely. The tone of Magnasco's work, less courtly than El Greco's, has its origins in that of Salvator Rosa and of Jacques Callot, though it is more straightforward and more varied in its poetic sense.

Magnasco's world is ironic and pathetic, bitter and religious, antirhetorical to the highest degree. His subjects include penitent monks and emaciated hermits, debauched gamblers and hungry ragged men, gypsies and nuns, camps and convents, funerals and bacchanals, tribunals and tortures. The setting is generally dark woods or gloomy rooms; flickering

light illuminates a humanity that knows no peace. His manner of expression, departing from the traditional norms, seems to prefigure modern painting. He resolved spatial and plastic problems much as Francesco Guardi (q.v.) did later, almost entirely by chromatic means. Colored lights glow and fade in the dark atmosphere from which forms emerge and take shape without distinct outlines, as if born out of, rather than inserted into, the space that contains them. Each form seems to have solidified momentarily from the dark and fluid space as it caught the light and gives the impression that it might quickly dissolve and disappear in space. Thus a disquieting sense of hallucination informs his pictures. The weak residue of Cinquecento mannerism that lingered in Genoa and Milan throughout the 17th century was altogether abandoned by Magnasco; his work laid the ground for 19th-century color values.

More than 400 works worthy of note are attributed to Magnasco. The Genoa exhibition of 1949 afforded so many telling comparisons of his works that it has been possible to attempt a chronology and establish certain milestones for Magnasco's mature period.

The uncertainties about his early Milanese activity remain. The *Old Woman and Gypsies* (X, PL. 510) and *The Tame Crow* (PL. 261) reveal, beneath the flashy brushwork that spreads the forms out into the atmosphere, an underlying solidity which probably places them before 1711, when the artist left Florence. Between 1711 and 1735 his forms became freer; his lighting in this period is luridly dazzling, all substance appears to be permeated by air, and the forms lose their weight. The two paintings of folksingers in the Warsaw National Museum show in their dissolving contours a systematic negation of academic tradition in drawing, while the stormy landscape with fleeing monks (Milan, Brera) and *The Communion of Mary Magdalene* (PL. 263) are marked by a mature and studied handling of accents, for example, the sweep of brown foliage in tremulous lighting against the curving turbulent sky. In the various bacchanals (private collections in Genoa and Milan), despite a rather academic mannerism in the nude figures, painterly means are used to render the sense of space and volume.

Perhaps the highest attainment of the mature Magnasco is represented by his pictures of monks warming themselves by the fire and of monks in a library (formerly Venice, I. Brass Coll.). The wasted dolichocephalic figures produce a sense of restlessness and pathos; they are disposed according to purely rhythmic considerations and consciously abstracted. The cadenced poses of the reading monks and the unstable equilibrium of the little monk dancing in the center of the hall, the fulcrum of all the forms that rotate around him, demonstrate that every trace of intellectual conception has been transformed by the artist's temperament into poetry. Closely related to these are *The Meal* (San Francisco, M. H. de Young Memorial Mus.) and the bold *Don Quixote* (PL. 263) at the Detroit Institute of Arts.

The four very beautiful paintings in the Benedictine monastery of Seitenstetten (Austria) were probably painted between 1720 and 1725 for the Count of Colloredo, then governor of Milan; these are *The Synagogue*, *The Refectory*, a scene of the writing room in a monastery (PL. 264), and *The Preaching of the Christian Doctrine in Milan Cathedral*. In these paintings, particularly in *The Synagogue*, the figures are even further attenuated and immaterial; the air seems to coalesce with objects that have become mere pretexts for the rendering of color and light.

The Gypsy Wedding Feast (Louvre), probably painted during Magnasco's late Genoese sojourn, is executed in the *macchia* (spot) technique by which the forms are not analytically but impressionistically composed. To an equally late period can also be assigned the other *Synagogue* (Cleveland, Mus. of Art), in which the rarefaction is even more extreme, and the breaking up of the forms almost exceeds the limits of figural representation. The ultimate expression of this tendency was reached in Magnasco's masterpiece, the patrician family scene in a garden with panorama (PL. 262); the azure streak of sky, the green lozenges of the plots of land, the black crisscross roads, and the grey zone of unbroken wall establish the setting for the exaggeratedly fashionable and curiously sinister figures of the foreground: powdered ladies and beribboned gallants, abbots, lap dogs, and madrigal singers amid all the glittering clutter of the decadent baroque. In this painting, however, all that remains of the outworn and affected mannerism of the 18th century is the figural content, which serves only as a vehicle for the creative advance of the artist toward formal abstraction.

Toward the end of his life Magnasco's vision grew ever more fantastic, more evocative. The images are ephemeral, phantasmagorical; bodily form, freed of weight, exists only as color. This is the period of the Cézanne-like *Supper at Emmaus* mentioned above, one of the finest of these last works.

Magnasco is now recognized as one of the most imaginative painters of the first half of the 18th century, that productive but chaotic period in Europe. To admirers of the clear classic genius Magnasco's elusive impressionism may not be a congenial style, but by comparison with much of the Italian art of the 17th and 18th centuries, with its stress on academic craftsmanship and its virtuoso showmanship, Magnasco's sincerity, restrained idiom, and incisiveness stand in refreshing contrast.

In all probability Magnasco had no students but only isolated imitators such as Ciccio the Neapolitan and Coppa the Milanese, who are known today only by those names. Giuseppe Antonio Pianca, a painter from Novara who was active in Milan about 1720, was drawn to Magnasco's art but embraced only his manner without ever comprehending the spirit. Sympathetic understanding of Magnasco's artistic goals appeared later, and outside Italy, in the bitter and satirical creations of Goya and Daumier (qq.v.).

MAITANI, LORENZO. Sienese architect and probably also sculptor, son of the sculptor Vitale di Lorenzo (called "Matano"). The appearance of Maitani's name in a *catasto* (tax return) of 1290 places the date of his birth before 1270. On Sept. 16, 1310, he was appointed *Capomastro* (master of works) for the Cathedral of Orvieto, where he spent the last twenty years of his life, except for those rare occasions when he was called elsewhere to serve as an architectural consultant. He gave advice in 1317 and 1319–21 on the repair of the aqueducts at Perugia, in 1322 on the work in progress at the Cathedral of Siena, in 1323 on plans for the castle at Montefalco, and in 1325 on the repair of the castle at Castiglione del Lago. Maitani died in June, 1330.

It appears from the contract of 1310 that Maitani had repeatedly been called from Siena to Orvieto when the transept and apse of the Cathedral of Orvieto threatened to collapse, a danger he averted by erecting buttresses. He also began construction on the roof of the nave and continued this work after his appointment as *Capomastro*. His main occupation at this time was the erection of the west façade. In the Museo dell'Opera del Duomo are preserved two famous drawings on parchment of widely differing projects for this façade. One, showing a single-gable solution (PL. 265), has been dated by most scholars about twenty years earlier than the other, a three-gable solution that largely corresponds to the actual building (VI, PL. 333) and has therefore been universally attributed to Maitani. The earlier plan is strongly influenced by the façade of the south transept of Notre-Dame in Paris (ca. 1260) and could thus be the work of a Sienese master of about 1290 who had been to Paris. The drawing shows part of the decoration of the second pilaster of the façade, on which appears the Tree of Jesse, which was actually executed, and the Madonna with angels in the lunette, which was also executed later but in a vastly different style. These data seem to coincide with what is known about the career of Ramo di Paganello (see GOTHIC ART, VI, cols. 567–68), who was considered a sculptor of great renown in Siena, to which he had apparently returned from France (?; "ex partibus ultramontanis") in 1281. However, the documents in Orvieto indicate only that Ramo was employed there in a subordinate position and may thus have been just one of several Sienese sculptors who were aware of French architectural and sculptural developments; it cannot therefore be proved that he designed the earlier plan for the façade. In the later plan Maitani accepts in principle the older master's solution for the lower part of the façade, that is, the round arch of the central lunette and the framing of the three doors by four wide pilasters. [Since some of the reliefs on the two inner pilasters must already have been *in situ* in 1307 (Fumi, 1891, p. 213), this acceptance was unavoidable.] The French character of the earlier plan, however, is strongly modified; the pediments over the lateral doors are much lower, the rose window of the nave is flanked by narrow panels, and the three-gable system is introduced. All these departures from the French system are found between 1294 and 1302 in Arnolfo di Cambio's (q.v.) plan for the first façade of the Cathedral of Florence, and Maitani may have followed Arnolfo's example.

Most scholars attribute to Maitani a large part of the façade's sculptural decoration, including the six bronze angels flanking the marble Madonna in the central lunette (PL. 267), the three lower rows of the first pilaster, with scenes from Genesis, from the Creation to the Temptation (PL. 268), and the two lower rows of the Last Judgment on the fourth pilaster (PL. 269). Finally, the symbols of the four Evangelists above the four pilasters are also ascribed to Maitani.

The bronze angels are mentioned in documents of 1325, at which time more than six sculptors were preparing models for casting. It does not appear from the documents that Maitani had designed these models; his name is not recorded, and he may have reserved for himself only the role of coordinating the others' work. The style of the bronze angels is close to that of the above-mentioned reliefs on the first and fourth pilasters, but it might be argued that this similarity results not from the identity of the master but from the stylistic derivation of the angels from the reliefs. The scenes from Genesis and the Last Judgment seem superior in quality to the bronze angels; the Genesis scenes in particular seem to be directly developed from the style of those representing the youth of Christ (the Annunciation, the Visitation, the Nativity, and the Adoration) on the third pilaster (PL. 267). These four reliefs are related in composition to Giovanni Pisano's pulpit in the Cathedral of Pisa (1302–10; VI, PL. 213) and in style to a wooden Madonna and Child in the Museo dell'Opera del Duomo in Orvieto (PL. 266), a work that has plausibly been connected with the first drawing for the façade and must therefore be dated about 1300. The reliefs thus can be dated from about 1310 to before 1316, when the Visitation was copied in the silver shrine of the Cathedral of Pistoia. The author of the four reliefs would then be a follower of the master of the wooden statue, who may be identical with the first architect. Therefore Maitani could have been the sculptor of the Genesis and Last Judgment scenes only if he had been a pupil of the master of the four reliefs from the youth of Christ; this is dubious, however, because Maitani had been in Orvieto only occasionally before 1310. It is therefore doubtful that the assistants whom the contract of 1310 permits him to retain for the sculptural work were his own; it is quite possible that they were, rather, the pupils of the master of the four reliefs.

The Genesis and Last Judgment scenes show the combination of a decidedly Sienese Gothic style, which seems to parallel Simone Martini's, with a deep understanding of classical art. The organization of the Genesis scenes reveals the influence of the relief style of the columns of Trajan and Marcus Aurelius in Rome, and heads from Roman sarcophagi are ingeniously adapted in the Last Judgment. The architecture of the second plan for the façade is neither so Gothic nor so classical; in suppressing certain Gothic elements in the first drawing that would not appeal to Italian taste, Maitani did not go back directly to classical sources but to the modified "Tuscan" Gothic of Arnolfo di Cambio. Such a discrepancy between the style of Maitani the architect and Maitani the sculptor is entirely possible; but since the sculptural activity of the master is not clearly documented, the possibility should not be overlooked that the scenes on the lower registers of the first and

fourth pilasters were the work of another master. The two beautiful wooden crucifixes in the Cathedral, the crucifix in S. Francesco, the seated Christ blessing in the Museo dell'Opera del Duomo, all in Orvieto and all attributed to Maitani, would then be by one of the masters who continued the work in the upper registers of these pilasters. The symbols of the Evangelists are mentioned in documents of 1329 and stand in the same relation to Maitani as the six bronze angels.

Martin WEINBERGER

The history of Maitani criticism and of the problem of the authorship of the façade of Orvieto Cathedral and its sculptural decoration shows notable differences of opinion.

In the 20th century these questions were considered almost contemporaneously by A. Schmarsow (1926), W. R. Valentiner (1927), and G. de' Francovich (1927–28). Schmarsow, who rejected A. Nardini Despotti Mospignotti's opinion that the two Orvieto Cathedral façade designs preserved in the Museo dell'Opera del Duomo were both drawn by Maitani, assigned the first (PL. 265) to Ramo di Paganello, for whom there exist documentary references of 1281, 1282, 1288, and 1293 but no certain works. To this artist Schmarsow also assigned the Creation scenes of the first pilaster of the façade; to Maitani, then, would belong the reliefs of the other three pilasters, as well as the figures of the Madonna and Child over the central portal and the four symbols of the Evangelists; Maitani would have been responsible also for the second façade project. Valentiner credited Maitani with the two façade projects and the over-all design of the sculptural decoration of the pilasters, which would have been executed by Nicola di Nuto, mentioned in Orvieto documents of 1339 as the sculptor of several wooden figures of the Cathedral choir. Francovich attributed both façade projects to Maitani, who also would have conceived, and in part executed, the entire bronze and marble sculpture decoration of the lower zone of the façade, aided in the execution of the pilaster reliefs by four assistants. Francovich also assigned to Maitani certain wooden sculptures in the Cathedral, in the Museo dell'Opera del Duomo, and in S. Francesco.

H. Keller (1938) again considered the problem of the two drawings for the Cathedral façade, concluding that both were by a single architect, who could only be Lorenzo Maitani. P. Cellini (1939, 1958) maintains that the decoration of the two inner pilasters preceded the inception of Maitani's work on the façade (1310) and connects it with Fra Bevignate, excluding any contribution by Maitani to the execution of the façade sculpture. E. Carli (1947), overlooking Keller's article, returns to the question of the authorship of the two façade projects and is inclined to regard Maitani as responsible for the second one only. Carli, following Cellini, thinks that the decoration of the two inner pilasters was executed before Maitani's arrival and assigns them to the elusive figure of Ramo di Paganello. To Maitani himself — or possibly to a very close follower — Carli attributes the reliefs of the two outer pilasters; a pupil of Maitani would have worked on the central registers of the second and third pilasters and on the two upper registers of the fourth pilaster, while the upper scenes of the first three pilasters would have been executed after Maitani's death (1330). P. Toesca (1951) regards as most convincing the thesis — favored especially by Nardini and Keller — that the two designs are by a single author, probably Maitani. Toesca emphasizes the iconographic and stylistic homogeneity of the whole of the sculptural decoration of the lower zone of the Orvieto façade, "which thus may be regarded as integrally conceived by a single master. This master may well have been the Sienese Lorenzo Maitani, the architect of the façade." In 1959, John White, in a study of the reliefs of the Cathedral façade, expressed the conviction that the documents relating to the façade give a strong impression that the reliefs were executed between 1310 and 1330, when Maitani was master of works of the Cathedral; that nothing on the façade was executed prior to Maitani's appointment as master (1310); that all these reliefs — as Toesca and Francovich had maintained — indicate a fundamental stylistic unity achieved through the over-all direction of a single master, who could have been Maitani; and that this master employed four collaborators, as Francovich had suggested.

MALAGASY REPUBLIC. The large island of Madagascar, at the southwestern end of the Indian Ocean, took its present name, Malagasy Republic, when it became an independent state in 1960. Its unique ethnic and cultural composition is due both to the proximity of Africa and to its links with southern insular Asia. Migratory movements linking the island with Indonesia may date back as far as two millenniums. Contacts with European culture, mainly through French occupation, were of some importance in the modernization of the country, particularly its capital Tananarive (Antananarivo), but have had little influence on the arts.

SUMMARY. Indigenous cultures (col. 402): *Northern and western area*; *The interior*; *Southern area*. Modern period (col. 406).

INDIGENOUS CULTURES. The population (5,657,601, according to the 1961 census), traditionally subdivided into 19 tribes, shows a relative cultural and linguistic homogeneity, notwithstanding the marked anthropological and environmental differences. This homogeneity testifies to an active circulation of customs and ideas that undoubtedly antedates the attempts at political unification begun by the sovereigns of Imerina (in the central plateau) in the 18th century and completed by the French at the end of the 19th. The art of the country is little known. No systematic prehistoric and archaeological investigations have ever been carried out. There are no monumental complexes nor any visible architectural vestiges of any note belonging to past cultures, autochthonous or foreign. This discussion is therefore restricted to tribal arts of the relatively short period during which they are known to have existed. Malagasy works of art, modest in output, were practically unknown in Europe up to the first half of the 19th century, although the island had been discovered by the Portuguese in 1500, and very little has survived on the island itself because of the perishable materials generally used. With the European penetration these arts declined. In regard to geographical distribution, works of art are relatively scarce in the northern zones and along the eastern coast, while the best are found among the central-southern and southwestern tribes.

Northern and western area. The northern and western areas of the island, from the mouth of the Fanambana River on the Indian Ocean in the northeast to Tulear on the Mozambique Channel in the southwest, are occupied by the large Sakalava group and, farther north, by the linguistically and culturally related Antankarana. These are the ethnic groups most influenced by contacts with the African continent, for the most part by way of Comorian and Makua immigrants or Arab-Swahili merchants from Mozambique and the coastal regions farther north. Conversion to Islam of many groups may have contributed to the disappearance, especially in the north, of preexisting forms of figural art. There are still Arab and Indian colonies in these areas (and to a lesser extent along the southeastern

coast and elsewhere on the island), and ruins of buildings attributed to Arab immigrants of undetermined periods are frequent along the coasts and on the numerous small islands off the northern shores. No monuments of artistic value have come to light, but the archaeological finds around Vohemar on the northeast coast are worthy of mention. These consist of tomb furnishings attributed to foreigners of unknown origin, conventionally called "Iharanians" and known to the Sakalava as "Rasikaji." Excavations have yielded "swords, daggers, Chinese bowls and plates, Chinese and Persian trays, extremely fine long-necked Persian bottles, mother-of-pearl spoons, bronze mirrors, amphoras for antimony, glass-bead necklaces, diverse

Malagasy Republic, distribution of chief art-producing groups (tribal names in capitals).

pottery" (Deschamps, 1960), as well as unusual tripod pots and locally made basins of soft stone (chlorite schist). The coins, porcelains, and ornaments date back to periods between the 11th and 17th centuries, and the finds as a whole unquestionably indicate an immigrant culture of the Azanian type (see AZANIAN ART). Comparable but less extensive finds have been made in Malaika on the Bay of Ampasindava on the northwest coast.

Other documents of the past include the many menhirs found in almost every part of the island, particularly on the interior plateau. Except in Betsileo country they are unornamented. They have continued to be erected up to the present, and though they have no artistic value, they are of interest with regard to the problem of the relationship between the Malagasy and the south Asian and African megalithic cultures.

The contemporary art of the non-Islamic Sakalava is limited to wood carving for commemorative monuments to the dead and for the decoration of everyday objects. The working of steatite and

the decoration of bedboards occur sporadically and probably derive from similar crafts of the Merina (see below). Weaving — which in the Kandreho region produced the attractive rabanna (raffia cloth used for curtains and mosquito nets), with its strange polychrome motifs obtained by a technique similar to that of batik — is a gradually disappearing art.

The traditional Sakalava tombs, to be seen particularly in the zone of Morondava, are enclosed by solid fences surmounted by horizontal beams elaborately carved in high relief with recurrent motifs of a classic Malagasy type: rows of ducks (a symbol of pleasure), cattle pursued by crocodiles, birds. At the fence corners and at the center of the longer sides rise poles topped by stylized figures carved in the round, generally of women (the wives of the deceased) or large ibis. Other Sakalava wood sculptures, also of commemorative character, represent ithyphallic figures. All the sculptures are generally stiff and inexpressive, with triangular faces, arms close to the body, and elaborate coiffures (IX, PL. 250).

In the Maintirano region on the Mozambique Channel the Vezo, a tribe of fishermen living among the Sakalava but distinct from them, produce (or formerly produced) wood sculpture. Their work employs motifs continually recurring in Malagasy sculpture: vertical rows of animals (ox, dog, guinea hen) carved in the round along the shafts of ceremonial staves. Such staves are finished with "tortoise feet." The Vezo motif of the perching bird (decorated on the beak, wings, and base with geometric designs) is rare in Negro sculpture; there are Indonesian parallels, but here the motif seems closer to the steatite birds of Zimbabwe.

The interior. Among the tribes of the central plateaus, the most gifted in the field of decorative arts are the Betsileo, a cattle-breeding tribe. Their most interesting monuments are the *vatolahy*, monolithic steles centered on platforms of gneiss slabs or simply sunk into the ground. At times over 18 ft. high, these monoliths are burial or commemorative monuments of important personages. They are usually rectangular in cross section and surmounted (e.g., at Sabotsy) by amphora-shaped pinnacles or, more frequently, by bucrania. The sides are occasionally carved with geometric motifs in low relief or with superimposed profile figures of zebus in high relief. The largest *vatolahy* used to be erected for the Betsileo rulers as a symbol of their sovereignty over the land. Others were raised in honor of wealthy persons and decorated with bucrania to symbolize the abundance of their herds; in memory of individuals who died far from home or were drowned or assassinated; or in recognition of such important events as floods, hurricanes, council meetings, and gatherings of warriors. The *vatolahy* are also conceived of as dwelling places of manistic spirits and as such are objects of worship and receive offerings and sacrifices.

Equivalent to the *vatolahy* in function and often also in form are the monuments called *teza*, made of single blocks of wood in the form of a high rectangular prism surmounted by a massive rectangular wooden shelf from which emerges a spire or a series of pegs for bucrania. On the early examples still extant the polished sides and the superstructures are decorated with delicate carving of rosettes, concentric circles or rectangles, rows of chevrons or other geometric motifs, palmettes, etc., arranged in alternating bands along the entire height of the monument. These motifs recur through much of the island's decorative art. Robert Heine-Geldern has pointed out their close similarity to corresponding motifs of the Saadang Toradja (Celebes; VIII, PL. 23) and the megalithic monuments of Sumba (VIII, PLS. 24, 25; see INDONESIAN CULTURES). The finial is sometimes carved in the form of a vase.

Other Betsileo funerary monuments consisted of several sculptured pillars of the *teza* type, joined near the top by transverse wooden bars and enclosing in the center a square area (sometimes as much as 7 yd. per side) filled with flat stones. Monumental tombs of this kind were numerous in the region south of Ambositra, especially in Ikiangara, where Louis Catat counted about fifty. Most of these traditional structures, which are no longer built except in crude and simplified forms, have been severely weather-damaged.

Among the minor works of the Betsileo are carved house doors and shutters, sometimes bearing anthropomorphic reliefs, and the so-called "bambou de porteur," adorned with pokerwork of geometric motifs or outlines of cattle. However, much of the decorative repertory of these craftsmen is derived from Tanala art.

The Merina, who occupy the interior plateau north of the Betsileo but also form a dominating minority in almost all other parts of the island, have the largest and the most culturally evolved population. This superiority is not, however, reflected in the quality of their art. On the contrary, their artistic aptitude is inferior to that of other Malagasy ethnic groups, except for two craft forms peculiar to the Merina. One is the working of steatite, from which they turn cylindrical or partly quadrangular monolithic lamps. These are decorated with longitudinal striping on the central portion and with

rows of geometric motifs in bands parallel to the base, which is broader, and to the top, which is sometimes carved in the form of a capital. Lamps of similar shape but less painstakingly decorated are also made of pottery covered with graphite, and others are elegantly formed of wrought iron, but all these objects are beginning to go out of use.

More interesting artistically are the bedboards of the Merina, which are now becoming collectors' items. These polished hardwood panels with a fine dark patina, about 2 yd. long by 10–13 in. high, formerly served to hold the straw beds of noble and well-to-do persons (VIII, PL. 39). The entire outer surface is decorated with incised geometric motifs or series of human or zoomorphic figures carved in low relief, in processional ranks or genre scenes. In the oldest examples, which date from the early 19th or the late 18th century, at the earliest, geometric decoration prevails; the motifs are often based on Azanian or similar Indonesian motifs. Contemporary representational subjects — warriors (armed or in battle), horsemen, houses, animals — are seminaturalistic in form or very naïvely stylized. In later examples, datable to the reign of Radama I (1810–28) and the next two or three decades, geometric decoration is used only on the ends of the board, while the center is carved in low relief with gracefully realistic figures (soldiers in the uniform of the period, ladies with umbrellas), genre scenes, plants, and animals (particularly cattle and birds).

The other groups of the interior plateaus, to the north of Imerina, produce little art. The Sihanaka of Andilamena make "talisman-paddles" with triangular handles topped by full-round figures (birds, boars, oxen, horses, etc.) carved in one piece with the object itself. The various colors of the veining in the local varieties of rosewood are skillfully exploited. The Tsimihety, farther north, make staves for the chief or *ombiasy* (witch doctor) that are surmounted by sculptured figures of men, mounted oxen, etc., but such work is not peculiar to this tribe; similar staves or batons are found along the west coast and elsewhere on the island. The Sihanaka, the finest basket-weavers of the island, are renowned for their mats with checkerboard patterns and concentric squares (II, PL. 230).

Southern area. The tribes of the southern areas, which have remained relatively unchanged by European influence, have best maintained the traditions of wood sculpture and various minor arts. The perishability of the materials employed and the lack of historical documentation preclude even conjectural dating of these arts. So far no serious attempt has been made at stylistic comparison to prove, or at least to present as an interesting possibility, affinities with either Bantu or Indonesian sculpture. Although it cannot compare in quality with either of these, the wood sculpture of southern Malagasy presents a wealth of tribal styles, most of which are yet to be studied.

The most noteworthy works of the Antaimoro, whose territory fronts on the Indian Ocean, are the so-called "tomb guardians" (now in Tananarive, Coll. Poirier) found near the royal village of Vohipeno. These are typical examples of anthropomorphic posts, with arms barely indicated and stylized faces. Also from this tribe comes a wooden rice measure (Paris, Mus. de l'Homme) engraved with curious genre scenes, small figures, animals, and houses, and framed by friezes of lozenge and chevron designs.

Among the Tanala, the western neighbors of the Antaimoro, incised geometric decoration (on objects of daily use such as containers, mortars, and doors) prevails. This has been transmitted to the neighboring Betsileo and perhaps even to the Merina. The art of the Bara is more diversified, including wood sculpture in the round (in particular, the so-called "female idols"), figured spoons and combs, and some of the most interesting of the *ody* (the container-amulets common to various Malagasy tribes), with zoomorphic figures in low relief. Peculiar to the Bara is the manufacture of knives with brass handles in the shape of human figures, horsemen, or entwined couples. A tomb found in the Mangoky River region in Bara territory is of interest for the study of the development of Malagasy funerary art. The corpses were placed on biers, the covers of which, shaped like the hull of a boat, are carved on the central rib with motifs of oxen, houses, and canoes. No precise dating can be established, but the tomb is certainly not very old. In spite of its location, it has been attributed to the Sakalava.

The most original art is that of the Mahafaly, who inhabit the southwestern districts of the island. Of particular interest are the *aloalo*, the carved openwork posts surmounting the tombs. They are made of a single trunk of light-colored wood, about 8 in. wide and up to 2 1/2 yd. high, carved with vertical rows of crescents joined on their convex sides, openwork hexagons, lozenges, and ellipses with incised ornament. The post may rest on the head of a slender male or female figure and may be finished at the top with a simple openwork circle or a minute platform bearing an anthropomorphic or birdlike figure, a house, or a horseman. The human figure is rendered with convincing and vigorous realism. Placed in groups above the stones and bucrania that cover the tombs, the *aloalo* exhibit an elegant sense of balance and are unquestionably among the most beautiful of the Malagasy creations. Another form of Mahafaly commemorative art comprises independent anthropomorphic sculptures on which both pyrography and incision are used to emphasize the facial features and an uncommon technique of cross-hatching to render the hair. Outstanding products of the applied arts are the beautiful *ondana* — the almost rectangular wooden headrests decorated in the center with a duck elegantly carved in openwork — and the wooden containers for water and honey, lightly ornamented on the outer surfaces and lids with human and animal figures (crocodiles, cattle, birds) engraved in black and framed by bands of triangles, chevrons, St. Andrew's crosses, and a variety of other geometric motifs.

The Antandroy, eastern neighbors of the Mahafaly and the southernmost tribe of the island, produce harmoniously proportioned three-stringed musical instruments decorated with bovine heads (Coll. Poirier), fine carved wooden plates, and wooden figurines executed to the most minute details (e.g., eyelashes of applied hairs, and nails) in realistic style. One such figurine (Coll. Poirier), said to come from the Ambovombe district, may be considered for its style and harmony of modeling among the finest examples of Malagasy sculpture. The tribal origin of these statuettes is not always certain, and just as it is known that many of the *aloalo* on Antandroy tombs were acquired from Mahafaly craftsmen, so it is also possible that this particular statuette and other similar objects were the work of some Antaisaka sculptor.

Vinigi L. GROTTANELLI

MODERN PERIOD. As a result of the great influx of Europeans to the island's capital during the 19th century, the social and economic life of the country is gradually evolving toward assimilation of Western modes.

Tananarive, capital of the Malagasy Republic, is the only important commercial center of the island. Situated on the Rova, a rocky height on the plateau of Imerina, the city had its first spurt of growth under the Merina dynasty, toward the end of the 17th century. The remains of fortifications of the citadel belong to this period. During the 19th century the city spread out at the base of the cliff. By 1895, the year of the French occupation, Tananarive already had numerous churches, palaces, and other buildings, among them the Cathedral and the Queen's palace (now housing the Mus. des Beaux-Arts). At the beginning of the 20th century it extended northward and, after the construction of the railroad and station, northwest as far as Lake Anosy. In the latter area lies the modern administrative and business quarter, the Zoma, traversed by a wide thoroughfare with modern office buildings and stores, a large covered market, and the post and telegraph offices. In the broad residential areas of the northern zone are the palace of the prime minister, the theater, and the town hall, as well as modern schools, cultural institutions, and parks. An institute of scientific research, surrounded by a park, rises at the edge of the city. There are also historical and folklore collections.

MALAYA. The Malay Peninsula south of Thailand is now part of the Federation of Malaysia, which, as established in 1963, also includes Singapore, as well as North Borneo (now Sabah) and Sarawak. (The latter two are discussed in connection with INDONESIA and INDONESIAN CULTURES.) The 11 states of Malaya proper are Johore, Kedah, Kelantan, Malacca, Negri Sembilan, Pahang, Penang, Perak, Perlis, Selangor, and Trengganu. The indigenous population of Malaya and Singapore is made up of the Malays and the Jakun, Samang, and Sakai (or Senoi) tribes. The arts of these tribes remain on a primitive level, while the Malays have been influenced by Indian art in the fields of architecture, sculpture, woodworking, and work in precious metals (see INDIA, FARTHER).

SUMMARY. Prehistoric discoveries (col. 407). Primitive tribal art (col. 407). Malay art (col. 408). Modern centers and developments (col. 409).

PREHISTORIC DISCOVERIES. There have been frequent discoveries of prehistoric artifacts throughout the peninsula. The earliest finds so far were discovered in the gravel of the Perak River valley at Kota Tampan, in 1938, and in Wellesley, a division of Penang. The former belong to the Lower Paleolithic, and the latter to the Upper Paleolithic.

The Hoa-binh culture (ca. 5000–3000 B.C.) belongs to the proto-Neolithic period and is characterized by crudely worked stone tools and by pottery (Perak, Wellesley); from the Neolithic proper (Terembeling; Gua Cha, II, PL. 14; Gua Kepah) come implements of polished stone and fired pottery — ranging from simple round bowls to plates, vases, and jars — decorated with bands impressed by means of a twisted cord; also dating from this period is the ax with rattan handle, akin to the Mongolian ax. Robert Heine-Geldern ("Urheimat und früheste Wanderungen der Austroneser," *Anthropos*, XXVII, 1932, pp. 543–619) believes that this culture, which he calls "the quadrangular adze culture," may derive from northeastern India; other authors, however, argue in favor of southern China and northern Indonesia. The local Neolithic period persisted until about the beginning of the Christian Era, but it has not been possible to establish its initial date. Human remains have not been found in association with the paleolithic deposits. Those found in mesolithic and proto-neolithic sites have Melanesian traits, while those associated with late neolithic deposits exhibit a great many affinities with the present-day Semang.

Of particular interest are the dolmens and menhirs belonging to the megalithic culture. The most important monument, at Berhala Lima (Kota Bahru), consists of a central group of vertical stone slabs, flanked by rows of enormous, aligned blocks; the post of honor for the ancestor spirit to which the entire construction is dedicated, which is north of the central group, is a peculiarity of the Asiatic monuments that is not found in European monuments of this type.

At Slim, Sungkai, and Changkat Mentri (Perak) and at Bukit Jong (Pahang), tomb slabs have been found along with bronze utensils, iron tools, and decorated pottery. While the bronze objects are clearly of Indonesian type, the iron objects are thought to have come from India. At Tembeling and Klang have been found decorated fragments of ceremonial bronze drums of the same type as those found on the Pasemah plateau in Sumatra and, like them, of Dông-so'n derivation (see INDONESIAN CULTURES).

PRIMITIVE TRIBAL ART. The hunting and gathering tribes of the forest, to whom the Malays indiscriminately apply the name *orañ utan*, or wild man, comprise three groups: the Semang, the Sakai, and the Jakun. Their art is limited for the most part to modest decoration of bamboo combs, blowguns, quivers, and other utilitarian objects. The combs, used only by women, are decorated with incised bands, of which the number as well as the sequence of the designs is fixed by tradition. In the six-band combs of the Semang of Perak, the pattern of the second band recurs in the sixth, and that of the third in the fifth; the fourth band, usually larger, must have a different design. The tribesmen attribute to these designs magical powers against disease and the bites of insects and poisonous snakes, and the motifs recur with the same magical significance on ear ornaments, blowguns, and quivers. This amuletic decoration thus provides the primary creative stimulus for the tribal artists, who may either represent an object symbolically or reproduce its form with some realism. For the most part they prefer geometric decoration, and the interpretations of the design are often contradictory. The decorations, generally known as *bunga*, represent plants, flowers, animal teeth or eyes, bird heads, and serpents; the plants depicted are those believed to have magical or medicinal properties.

The combs of the Semang of Perak are preeminent for the beauty of their design and workmanship; those of the Sakai of Kedah and Perak are distinguished by the presence of two small, curved appendages at the sides. The decoration is achieved by removing the outer bark of the bamboo from the parts not covered by the design, so as to make the design stand out in relief. The background is darkened with a special resin (*damar kelulut*) in order to accentuate even more the whitish natural color of the remaining bark. Sometimes the reverse is done: the bark is removed from the design, which is then colored so that it stands out against the light background.

The cave art of the Semang is a modern development, of which notable examples exist. The finest series is found in Gua Badak (Rhinoceros Cave) in northern Perak. Among the subjects most frequently depicted are monkeys, bows and arrows, coconut trees,

Malaya, principal cities and ethnic groups (ethnic names in slanting capitals). *Key*: (1) Modern national boundaries; (2) boundaries between states: (I) Johore; (II) Malacca; (III) Negri Sembilan; (IV) Selangor; (V) Pahang; (VI) Trengganu; (VII) Kelantan; (VIII) Perak; (IX) Penang; (X) Kedah; (XI) Perlis.

men performing various tasks, and automobiles. The figures in black are colored with charcoal, while those in white are obtained by scratching the limestone surface.

Another occupation of these tribal peoples is basketry (mats, containers, nets for capturing wild game, etc.), usually so carefully executed as to rival those of the Malays. The most common materials are the fibers of bamboo, rattan, and breadfruit (*Artocarpus communis*). Clothing is made from the last-named by pounding its fibrous bark. In comparison with the similar production of the Indonesians in Celebes and Halmahera, the workmanship of these garments is rather crude. The belts worn by the women are woven of long, very fine vegetable fibers and wrapped several times around the waist. The Semang of Jeransang (Pahang) make them of rattan fibers and decorate them with crude designs — two species of snake, as well as bees and fish — to which they attribute magical powers that protect the wearer from backaches.

None of the tribes knows the use of fired clay; instead, they use containers hollowed from segments of bamboo.

MALAY ART. Indian civilization has influenced Malay art since the slow process of Hinduization of the peninsula began in the first centuries of the Christian Era. Architecture, sculpture, and the working of wood and precious metals developed under this influence. Conversely, the contribution of Islam (beginning in the late 13th cent.) must be considered minor, since there exist no outstanding Islamic monuments, with the exception of the numerous tombstones of sultans (bearing inscriptions in ancient Malay) such as those of 22 sultans of the Perak dynasty found along the banks of the Pera River. In Kedah, at many sites on the banks of the Sungai Dujang, there are temple ruins dating back to the 5th–6th century; in plan (a solid raised base with a terrace for circumambulation) and in building

technique (employing blocks of laterite) they seem to resemble very closely the stupas of southern India. However, the deterioration of the buildings prevents a more detailed comparison. The remains of the principal buildings of an old city on the banks of the same river are of an architecture that can be defined as a peripheral imitation of the Indian.

Also found in Kedah, along the banks of the Sungai Batu Pahat about 2 miles from the village of Merbok, were the ruins of a stone temple, which H. G. Quaritch Wales has assigned to the 7th–8th century and interpreted as a tomb-temple, of the same type as the Javanese candi, built to provide proper burial for deceased rulers. Buildings of this type are very common in Malaya; their shape — tapering toward the top and terminating in a spire — had the symbolic function of connecting the dynasty of the deceased with the world of the gods. Precisely because of this belief, many of these tomb-temples were destroyed by rulers of later dynasties, with the aim of severing the tie between their predecessors and the supernatural world. The plan of the Sungai Batu Pahat structure also exhibits many points of similarity to the temples of southern India but differs in the small dimensions of the building, the material employed, the stone socle of the wooden piers, and the extremely austere decoration. A noteworthy example of a Buddhist temple in Chinese style is the Kek-Lok-Si, with a 7-story pagoda, in Penang.

Sculpture, also of Hindu derivation, is widely used throughout the peninsula in the decoration of temples, tombs, and sacrificial altars. Representations of the Buddha are very frequent. The earliest known image is of bronze and was found, with fragments of pottery from a very large jar, on the banks of the Sungai Dujang (Singapore, Raffles Mus.); it portrays a standing Buddha and has been assigned on stylistic grounds to the Gupta period (5th cent.).

Originality and great refinement have been attained in the working of wood (thrones, furniture, bamboo boxes) and brass (lamps for mosques, lamps in the form of mythological birds for the shadow theater, and articles used in connection with siri, or betel).

Ironwork is very important, chiefly in the manufacture of weapons. The kris — introduced, according to Heine-Geldern (op. cit.), during the Bronze Age — varies widely in ornamentation and size in accordance with very precise standards; the Majapahit variety (named for a medieval kingdom in eastern Java), with blade and hilt formed in a single piece, is the most ancient type still in use.

Pottery is copied from Chinese models, which were imported into Malaya during all periods, as attested by numerous archaeological discoveries. Pasik Durian, in the Tembeling area, is a center of this production. The textile work, with its original designs and striking colors, is also noteworthy.

MODERN CENTERS AND DEVELOPMENTS. With the end of World War II and the subsequent achievement of self-government there began an era of accelerated industrial, urban, and agricultural development, which is rapidly changing the face of Malaya. Business and residential construction continues to contribute to the modern appearance of Kuala Lumpur, long the major city of the peninsula. As capital of Malaya, and of the Federation of Malaysia from the time of its formation, the city also has many government buildings, prominent among them the 18-story Malaysia Parliament and an older structure with a clock tower that houses the Selangor State Secretariat and other government offices. The University of Malaya, founded in 1957, is located here.

Notable examples of industrial and urban development are the new industrial estates or satellite towns, the first of which is Petaling Jaya about 8 miles from Kuala Lumpur. Land set aside by the government for private industrial development is occupied by many factory buildings (built by both foreign and domestic capital, mainly as joint-venture projects). Plans for further residential construction in this new industrial city include some multistoried apartment buildings, as well as other forms of low-cost housing. Other industrial satellite towns are underway at Tesak (Perak), Johore Bahru (Johore), and Butterworth (Penang).

Throughout Malaya public planning and investment have resulted in the modernization and expansion of such facilities as airports, harbors, roads, communication, and other public utilities. Land reclamation projects have involved dam construction, such as that on the Klang River. (Similar programs have been undertaken in Sabah and Sarawak, the less developed states of the Federation of Malaysia. At Jesselton, the capital of Sabah, the traditional waterfront stilt houses are being replaced by new residential structures.)

Singapore. Located on an island of the same name and connected with the mainland by a concrete causeway, the city has about 1,700,000 inhabitants. At the beginning of the 19th century, it was only a village ruled by the sultan of Johore, from whom it was acquired for England in 1819 by Thomas Stamford Raffles, a British colonial officer. Today it is a modern cosmopolitan city and one of the major ports in the Far East. The most characteristic quarter is the Chinese, with a number of temples. Nanyang University was established in 1953 for Chinese-speaking students. The commercial life of the city centers around Raffles Place. Among the notable buildings are the Gothic St. Andrew's Cathedral; the University of Singapore (founded 1949; formerly the University of Malaya); Raffles Museum, with a permanent exhibit of local art objects; Government House; and the Supreme Court building. The Botanical Garden is one of the finest in the world. There are a large number of Christian churches, Hindu temples, and mosques. The city's modern airport is located at Paya Lebar.

MALEVICH, KAZIMIR. Russian painter, founder of suprematism (b. Kiev, Feb. 11, 1878; d. Leningrad, 1935). Malevich was the son of a Polish father and a Russian mother. After study at the Kiev School of Art, he went to Moscow about 1900 and by 1904 was enrolled in the city's Academy of Fine Arts. The impact of contemporary French art turned him toward a radical Fauvist manner about 1910. In 1910–11 he exhibited with the Jack of Diamonds group and thereafter took part in most major exhibitions in Moscow and St. Petersburg. In 1912, after a brief visit to Paris, Malevich began working in a cubist style, and by 1915 he had developed suprematist painting, stressing the primacy of fundamental geometric shapes and pure color (see CUBISM AND FUTURISM; EUROPEAN MODERN MOVEMENTS).

Malevich was a dominant figure during the years 1918–21 and occupied important teaching posts in Moscow and Vitebsk. The official reaction against abstract art in 1921 led him to Leningrad, where, except for a visit to Germany and Poland in 1927, he lived in seclusion until his death. His major works include *The Scissors Grinder* (1912–13; New Haven, Yale Univ., Soc. Anonyme Coll.), *Suprematist Composition* (V, PL. 137), *Large Strong Cross on White* (1916–17; Amsterdam, Stedelijk Mus.), *White on White* (ca. 1918; New York, Mus. of Mod. Art), *Suprematism Form aE* (drawing, 1924; Amsterdam, Stedelijk Mus.).

Like his contemporaries Kandinsky and Mondrian, Malevich devoted himself to the promulgation of a universal artistic language based upon a purified, abstract geometry. His suprematism was a major force in progressive Russian art of the period and, especially through its influence upon constructivism, played an important role in the evolution of Western abstract art.

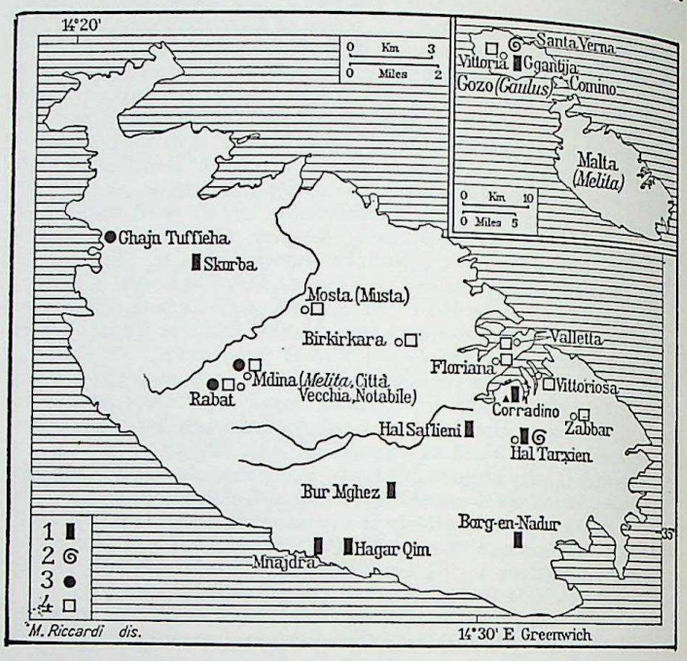
MALTA (MALTESE ISLANDS). This small group of islands, comprising Malta (Gr., Μελίτη; Lat., Melita), the principa island, Gozo, and Comino, situated at the intersection of severa important maritime routes in the Mediterranean south of Sicily, has come under the influence of various civilizations and cultural currents. Malta was the site of a neolithic civilization that produced original and monumental edifices. In historical times the islands were dominated and culturally influenced first by the Phoenicians and then by the Romans. In the early Middle Ages they passed from the Eastern Roman Empire to the Arabs; later, as part of the Kingdom of Sicily, Malta came under Norman, Angevin, and Aragonese rule. In 1530 Emperor Charles V assigned the islands to the Knights of St. John of Jerusalem (Knights of Malta). From 1814 Malta was a British possession administered, in later years, under various forms of self-government. It received its independence in September, 1964. The art heritage of the islands is particularly rich in prehistoric remains and in Italian baroque art forms and reflects the many changes of sovereignty to which Malta has been subjected.



SUMMARY. Phases of cultural and artistic development (col. 411): *Prehistory; Punic and Roman periods; Medieval and modern periods.* Art centers (col. 414).

PHASES OF CULTURAL AND ARTISTIC DEVELOPMENT. *Prehistory.* The monumental neolithic remains of Malta, known since the 17th century, were at first believed to be Phoenician protohistoric. The discoveries of Sir Themistocles Zammit (whose classifications and theories were disputed by J. D. Evans) and the conclusions drawn from the researches of L. M. Ugolini formerly tended to place Malta on a very high cultural plane, as the focal point of the entire central Mediterranean civilization. The recent trend among archaeologists is to consider the Maltese neolithic as a relatively late offshoot of the Aegean neolithic civilization. The most spectacular remains of the Maltese Neolithic period include Pawla (Paola) and Hal Tarxien, southeast of Valletta, Hagar Qim, Mnajdra (Mnaidra; PL. 426), and, on the island of Gozo, the Ggantija ("Giant's Tower"). All examples of mature and advanced architecture, these religious buildings, with many chambers along a longitudinal axis, are built of huge upright stone slabs with delicately decorated faces; traces of corbeled vaulting remain. The hypogeum of Hal Saflieni, near Pawla, entirely carved within the rock, follows the same architectural scheme, but, being perfectly preserved, it gives an idea of what a complex religious structure was like. The same originality of concept and daring of execution may be seen in small sculptures, such as the so-called "Venus of Malta" and the "Sleeping Lady," both remarkable for their modeling. The neolithic civilization came to an abrupt and mysterious end, probably before the end of the 2d millennium B.C. Compared with its neolithic predecessor, the subsequent Bronze Age civilization, whose origins and contacts with the world outside Malta are better known, represents a cultural regression. Upright stone slabs and dolmens indicate that in the Bronze Age Malta was on the same cultural level as the rest of the Mediterranean (see MEDITERRANEAN PROTOHISTORY).

Punic and Roman periods. Under the Phoenicians (first from Sidon, later from Carthage) Malta entered history, but except for the well-known bilingual cippus of a very late period, a fine anthropoid sarcophagus, and some pottery, the Punic phase left little of interest. The contrary is true of the Roman period, which began in 218 B.C. Cicero, in the second Verrine oration (IV, xlvi), mentions the temple of Juno, which was despoiled of its treasures by Verres. Epigraphical remains and architectural fragments provide evidence of other monumental edifices of Roman Melita. The Museum of Antiquities, housed in a Roman villa discovered in 1881 at Rabat (near Mdina), contains a collection of important architectural fragments, sculpture, and mosaics. A particularly fine piece is a Hellenistic mosaic showing a satyr punished by Bacchae. Also noteworthy are a Hellenistic head of a pugilist and a number of portraits. Roman mosaics are also found in the ruins of the baths of Ghajn Tuffieha, on the west coast. The Roman city of Melita was situated on a hill in the center of the island. It is now known as Città Vecchia or Notabile (from the title conferred on it by Alfonso of Aragon in 1428) or under the Arab name of Mdina (Medina). In the 6th century its Byzantine rulers demolished a part of the city in order to defend it more effectively; they dug a defensive ditch (now the southern boundary of the city) and razed the buildings beyond this limit. Part of the Roman city and its monuments are still buried.

Medieval and modern periods. There are few early medieval and Arabic remains, the only noteworthy piece being the Kufic stele of Maimuna. A few scattered Romanesque capitals provide evidence of buildings belonging to the pre-Gothic period. In the underground chapel of the catacombs of St. Agatha, in Rabat, remains of Byzantine-Romanesque paintings have been found. In the 15th and 16th centuries the painters Pietro Rozzolone, Antonello de Saliba, and Salvo di Antonio worked in the churches of Malta. Alessandro Varotari (also called "Padovanino"), otherwise known only for a single painting (Syracuse, Sicily, Mus. di Palazzo Bellomo), worked in Mdina in the old cathedral, which was destroyed by earthquake in 1693. Antonello Gaggini (1478–1536) executed important sculptures for Malta.

Under the Knights of St. John of Jerusalem (1530–1798) Maltese culture moved out of the confines of Sicilian insular culture into the

Malta and the Maltese Islands (inset). Principal art centers and monuments of archaeological and artistic interest. *Key*: (1) Monuments and settlements of the Neolithic period; (2) Bronze Age sites; (3) towns and monuments of the Roman period; (4) modern cities, towns, and villages.

wider sphere of Italian artistic tradition. After the brief period of late Gothic style, introduced from Rhodes by Niccolò Flavari, the Knights of St. John turned to the Italian courts for new architects. The Knights established headquarters in the coastal town of Borgo del Castello, the name of which was changed to Vittoriosa after the siege of 1565. It was here that Bartolomeo Genga of Urbino built palaces and churches and laid out plans for the new city (as recorded by Vasari, among others). Baldassare Lancia of Urbino, Nicola Bellavante, and Antonio Ferramolino of Bergamo also worked here at this time. Among painters, there were Filippo Paladini, a Tuscan, and Matteo Pérez de Alesio (known as "Matteo da Lecce"), who went to Malta from Rome after he had completed the series of frescoes in the Sistine Chapel.

The most flourishing period in the arts was the 17th century, when Caravaggio (q.v.), Mattia Preti, and Lorenzo and Melchiorre Gafà were active. Lionello Spada and, apparently, the Sicilian Mario Minniti went to Malta after Caravaggio's arrival. Preti, who settled on the island in 1661, was commissioned to decorate the ceiling of the Cathedral of St. John in Valletta. This ceiling may be regarded, since the removal of its 19th-century restorations, as an important and well-preserved example of 17th-century Italian painting. Preti also worked as an architect; it has been definitely established that he designed the Sarria, a church in Floriana.

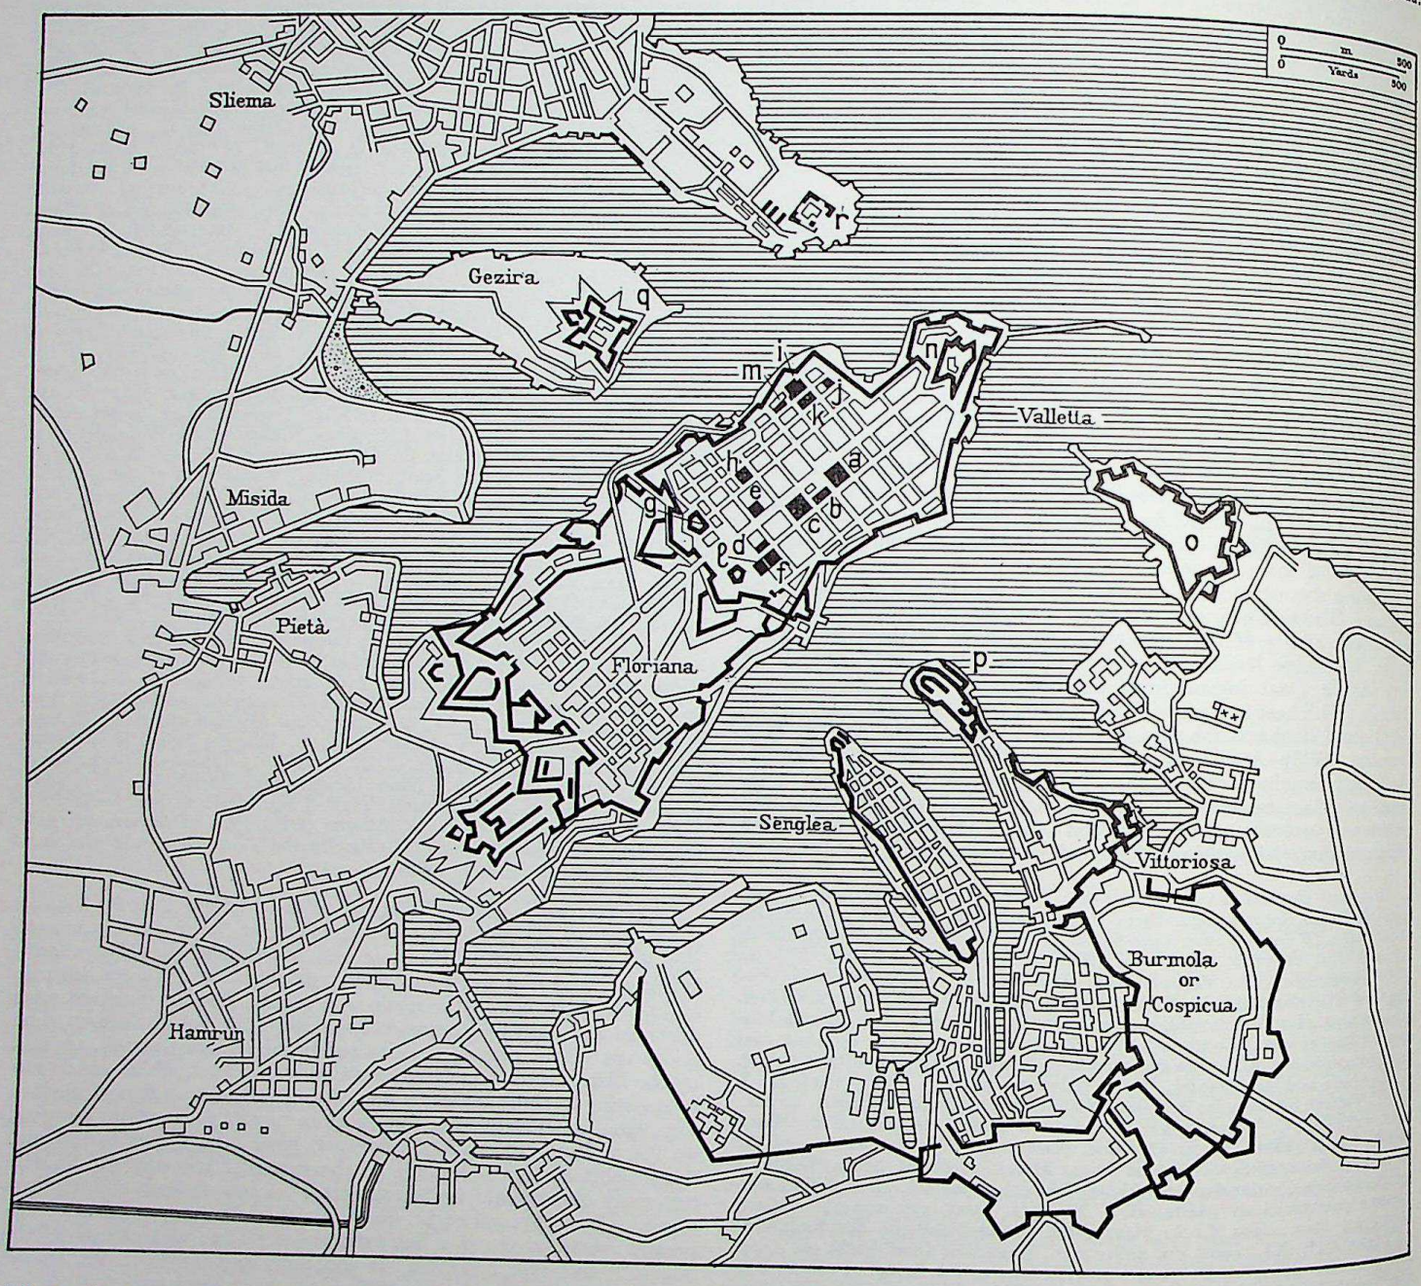
Melchiorre Gafà, the Maltese sculptor whom Bernini cited as a craftsman capable of surpassing him, left very few works on his native island. The *Baptism* in St. John's Cathedral, a colossal sculpture for which he had been commissioned in 1666, was actually executed by Giuseppe Mazzuoli, the artist who probably also carved the funerary monument of Ramon Perellos in that church. Lorenzo Gafà, younger brother of Melchiorre, was an architect trained in Rome who introduced baroque forms into Maltese architecture.

There were a number of good Maltese architects active in the 18th century. Giovanni Barbara, a daring military engineer and an excellent architect, built the parish church of Lija and the elegant

elliptical Church of St. James at Valletta. Giuseppe Bonnici designed the austere Customs House and the Church of St. Barbara at Valletta. Other architects of this period include the two Cachias, Antonio and Domenico. Among painters the dominating figures were two Maltese, Stefano Erardi, an artist of no great originality, and Francesco Zahra, who introduced the style of the Neapolitan school to the island. Toward the end of the century the Sicilian brothers Francesco and Vincenzo Manno and the Frenchman Antoine de Favray worked there, and many followers of Preti and various pupils of Zahra and De Favray were active in this period.

After the departure of the Knights of St. John in 1798, the artistic activity of the island was reduced to very meager proportions. Giorgio Pullicino, a native Maltese who had been sent to Rome, under the patronage of the Knights, to study architecture, returned in the first decade of the 19th century to find the community limited and miserly. In order to eke out a living, he was reduced to painting landscapes for foreign visitors. His fellow countryman, Grognet de Vassé, fared better; he designed and built the parish church, a vast circular edifice, in Mosta (Musta).

Several Maltese painters of the 19th century established their reputations, including Vincenzo and Giovanni Hyzler, trained at the Nazarene community in Rome; Pier Paolo and Raffaello Caruana, both pupils of Tommaso Minardi; Michele Bellanti, a good painter and lithographer; and Giorgio Bonavia, who became a successful portraitist in Paris and London. One of the great engravers of the 19th century, Luigi Calamatta, was a Maltese, although born in Civitavecchia, Italy. His contemporary, Amedeo Preziosi, was a painter of Oriental subjects and a lithographer whose work was fashionable in the European courts. Many painters of the Roman school — including Francesco Grandi, Domenico Bruschi, and Pietro Gagliardi and, somewhat later, V. Monti and A. Palombi — worked in churches in Malta. Two late-19th-century painters were L. Pisani and Gennaro Calì, trained in Rome and Naples respectively. The Maltese sculptor Antonio Sciortino also studied in Rome during the last decade of the 19th century.



Among the established painters of the first half of the 20th century are Gianni Vella and Eduardo Caruana Dingli. There have been many artists of that generation, nearly all of them trained in Rome, who have lived and worked on the island, exhibiting their work in the great international exhibitions of Rome, Venice, and London. The best known of these are the sculptors Vincenzo Apap and Giorgio Borg and the painters Giorgio Preca, Emanuele Vincenzo Cremona, Willy Apap, and Frank Portelli. Maltese architecture, which had remained traditional until the advent of World War II, began to reflect modern trends after that period, but architects still continue to use the square, dressed blocks of local limestone as a structural material within a frame of reinforced concrete.

ART CENTERS. Valletta. Capital of the Maltese Islands, Valletta is situated on the northern coast of Malta, at the tip of a peninsula that lies between Grand Harbour and Marsamuscetto (Marsamxett) Harbour. The city was founded in 1566 by Grand Master Jean de la Valette, from whom the name is derived. The fortifications were designed and built by Francesco Laparelli (1521–70) of Cortona, who also prepared the plan of the city and began its construction, assisted by the Maltese architect Gerolamo Cassar. Valletta, which has streets intersecting at right angles, is one of the earliest examples of modern city planning. The massive fortifications toward the interior, designed by Pietro Paolo Floriani of Macerata, have high sentry towers and deep moats and give the city its characteristic appearance. Valletta has many monumental buildings and dwellings of great architectural merit. The Cathedral of St. John, which contains a number of important works of art, is a fine example of Italian architecture of the late 16th and 17th centuries. It was built in 1573–77 in the Italian mannerist idiom by Gerolamo Cassar, whose local background and training are evident in certain elements and details of the design, such as the slightly pointed arches and the absence of any projecting entablature. In addition to the ceiling decoration by Mattia Preti and the work of Mazzuoli mentioned above, the church contains altarpieces by Mattia Preti, the great tapestries of Peter Paul Rubens depicting scenes from the life of Christ, and paintings by Caravaggio, Andrea Sabatini (called "Andrea da Salerno"), Andrea Piccinelli (called "Andrea del Brescianino"), Matteo Pérez de Alesio, Francesco Potenzano, Stefano Pieri, Lionello Spada, Palma Giovane, Giovanni Francesco Romanelli, Agostino Massucci, and Antoine de Favray. There are also sculptures by Antonello Gaggini, Alessandro Algardi, Massimiliano Soldani (Benzi), Vincenzo Pacetti, Pierre Puget, and Jean Jacques Pradier. The floor is inlaid with about four hundred sections of colored marble depicting the coats of arms, emblems, and deeds of some of the Knights, many of whom belonged to the highest-ranking nobility of Europe. Cassar built several other churches in Valletta and Auberges, or Inns, of the various components, or

"tongues" (*Langues*), of the Order. The Auberge d'Italie, a severely styled edifice, is the most noteworthy; built in 1574 and enlarged in 1683, it now houses the Law Courts. The Auberge de Provence, built in 1575, was also expanded later. It is now the National Museum. The imposing Auberge de Castille et León was rebuilt in 1744 by Domenico Cachia. The Palace of the Grand Master (now the Governor's Palace), which was begun about 1572 by Cassar and remodeled in the mid-18th century, survived the despoilments of the 19th century; it contains tapestries, furniture, ceramics, a fine

quez), A. Palombi, Vincenzo Hyzler, and Giacomo Ceci. The Jesuit church of St. Mary, by Cassar, contains paintings by Pietro Novelli (called "Il Monrealese"), Antonio Catalano, Pasinelli, Vincenzo Hyzler, and Giuseppe Bonnici. The Church of St. Francis, which was built in 1600 and remodeled in 1681, has been altered and restored in recent times; it contains paintings by Filippo Paladini, Mattia Preti, Pietro Gagliardi, and Gennaro Calì. The Church of St. Augustine, designed by Domenico Cachia, contains some good 19th-century paintings. The large altarpiece in the sacristy is by Lionello Spada.

Valletta, development of the city. Principal monuments: (*a*) Palace of the Grand Master; (*b*) Library of the Knights; (*c*) Cathedral of St. John; (*d*) Auberge d'Italie; (*e*) Auberge de Provence (National Museum); (*f*) Palazzo Parisio; (*g*) Church of Our Lady of Victory; (*h*) Church of St. Augustine; (*i*) Auberge d'Aragon; (*j*) Auberge de Bavière; (*k*) Archbishop's Palace; (*l*) Auberge de Castille et León; (*m*) St. Paul's Anglican Cathedral; (*n*) St. Elmo Fort; (*o*) Ricasoli Fort; (*p*) St. Angelo Fort; (*q*) Manoel Fort; (*r*) Tigne Fort.

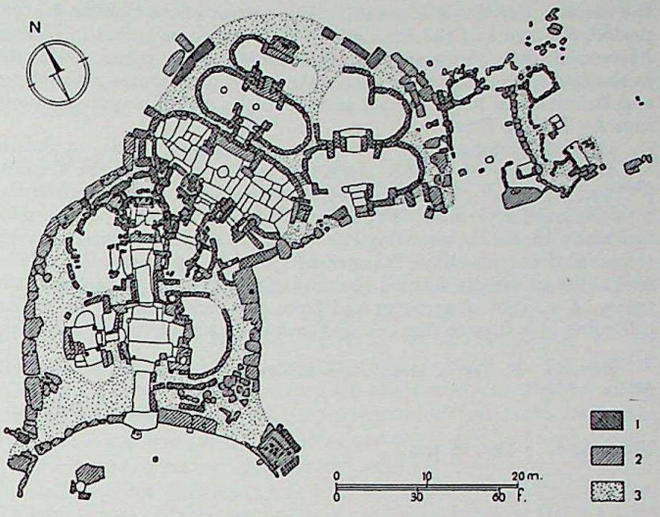
armory, and a number of paintings. The rooms were decorated by Matteo Pérez de Alesio, Filippo Paladini, and Nicola Nasoni (or Nasini). The statue of Neptune in the courtyard has been attributed to Giambologna but may perhaps be the work of Leone Leoni. There are many churches of great architectural interest and rich in works of art, the most noteworthy being the Gesù, designed by Filippo Bonamici of Lucca, in the style of the Counter Reformation. It contains paintings attributed to Baldassare Peruzzi and by Romanelli del Battistiello, Mattia Preti, Louis Finson, Romanelli, and Stefano Erardi. Another interesting and richly decorated church is St. Paul's, which has a wood statue by Melchiore Gafà and paintings by Filippo Paladini, Antoine de Favray, Giuseppe Velasco (or Velas-

Among the smaller churches are the Church of All Souls, which has paintings by Mattia Preti, and the Church of St. Catherine of Italy, which contains paintings by Mattia Preti and Benedetto Luti. The Church of St. Ursula has altarpieces by Mario Minniti, Mattia Preti, and Gennaro Calì.

The Library building was designed by the Catanese architect Stefano Ittar, whose rather precious decorative style anticipates neoclassicism. A characteristic feature of Maltese architecture is the overhanging "gallery," of Oriental derivation, which is an element that was introduced by the Knights and incorporated into the designs of Italian architects. The few structures built recently are sober and sometimes elegant. The most interesting contemporary

monument is the large fountain at the main gate of the city by the sculptor Vincenzo Apap.

The National Museum has an archaeological section, a numismatic collection, and a painting gallery with works by Tintoretto, Mattia Preti, Salvator Rosa, Alessandro Magnasco, and Giovanni Battista Tiepolo.



The surrounding towns and villages are generally dominated by large parish churches. The parish church of St. Mary in Attard is a good example of High Renaissance architecture; it was designed by the Maltese architect Tommaso Dingli. Also at Attard is the St. Anton Palace, the summer residence first of the Grand Master and later of the Governor. It was begun in 1623 and has a garden in the Italian style. At Birkirkara the Church of the Annunciation (begun by Vittorio Cassar; completed by Dingli) is partly in ruins. The village is dominated by the parish church of St. Helena, begun in 1727. The churches in Naxxar, Zebbug, Qormi, Siggiewi, and Luqa are interesting both for their plan and interior decoration. Zurrieq, a large and very old village, has a church containing many paintings by Mattia Preti, who took refuge in the village during an outbreak of the plague in 1676. In the garden of the parish house there are remains of several ancient buildings of different periods. The parish churches of Balzan and Lija are notable for their elegance. In Zabbar, just outside the fortifications built by Antonio Maurizio Valperga, there is a church with a well-articulated façade. The village of Mosta has a large circular parish church, built in neoclassic style by Grognet de Vassé in the first half of the 19th century. Many of these towns and villages were rebuilt extensively after World War II, some of them in a rather pretentious manner and not always in keeping with the character of the island.

Hal Saflieni. This locality near the village of Pawla acquired considerable importance in 1902, when a rock-cut neolithic hypogeum, which had been used for religious ceremonies, was accidentally discovered. Built on three levels, probably over a period of several centuries, the hypogeum is a complex labyrinth of passages, galleries, connecting chambers, and niches, some with doors and ceilings painted in red spiral patterns, as in the oracle chamber (or holy of holies). Several of the chambers are carved to imitate megalithic masonry, façades, corbels, and trilithons. In the hypogeum were found weapons, flint and obsidian tools, pottery with geometric incised decoration, and statuettes in terra cotta and stone, especially female and steatopygous fertility figures. The material is now in the National Museum in Valletta.

Hal Tarxien. This site, not far from Pawla, has an interesting complex of three neolithic temples. These temples are uncovered, but it is not known whether or not they were originally roofed. They consist of a number of interconnecting ellipsoid chambers that are especially noteworthy for their megalithic construction: large, dressed, and carefully joined limestone slabs placed either horizontally or vertically. The decoration consists of reliefs of floral and zoomorphic designs. On a hill above the temple complex there is a Bronze Age cremation necropolis which has given its name to the Bronze Age Tarxien Cemetery culture (ca. 1550–1350 B.C.).

Mdina (Medina; Notabile; Città Vecchia; Melita). A Roman municipium at the time of the Empire and later the capital of the island until the arrival of the Knights of St. John in 1530, this city is still enclosed within the Byzantine walls, which have survived intact, although they were partly restored in the 18th century. It looks like a medieval Sicilian city — with its narrow streets, monasteries with high windowless walls, and houses with graceful galleries of double-arched windows on the upper floors — except for its massive baroque Cathedral and a few 18th-century palaces. The well-preserved Falzan Palace is a noteworthy example of Sicilian-Norman architecture. The palace of the Banca Giuratale has a flavor that anticipates Piranesi's work. The Palace of the Grand Master, with balconies and an imposing portal, was built in the early 18th century. The Cathedral, designed by Lorenzo Gafà, was built in 1697 to replace the Sicilian-Norman cathedral built by Roger II in the 12th century and destroyed in the earthquake of 1693. It contains paintings by 15th-century Sicilian painters, by Mario Minniti, Mattia Preti, Francesco and Vincenzo Manno, and by the 19th-century artists Domenico Bruschi, Francesco Grandi, and Pietro Gagliardi. There are also a crucifix by Fra Innocenzo da Petralia and sculptures by Moschetti and Giuseppe Valenti. The baptismal font, the doors of the sacristy, and the choir stalls (partly restored by Preti) came from the old cathedral. Attached to the Cathedral is a museum containing illuminated manuscripts, drawings, prints, and paintings, including a 16th-century Catalan-Sicilian polyptych. The Church of St. Benedict contains two panels of a polyptych by Salvo di Antonio (1511) and an altarpiece with a Madonna and saints by Mattia Preti.

Hal Tarxien, plan of the neolithic temples I, II, and III. *Key*: (1) Outer walls of vertical stone slabs; (2) inner walls of horizontal blocks, altars, bases, and seats; (3) rubble and earth filling the space between the inner and outer walls (*from Ceschi*).

In the neighboring suburb of Rabat are the remains of a Roman villa, now housing the Museum of Antiquities. The church of the Minorites contains a *Madonna and Child* and a *Deposition* by Antonello de Saliba and a *Madonna and Child* by Antonello Gaggini (1504). The parish church of St. Paul and the Sanctuary of St. Publius have a single façade. The church contains a *Madonna and Saints* and other paintings by Mattia Preti, works by Stefano Erardi and Francesco Zahra, and a 16th-century wooden crucifix, brought to Malta from Rhodes. Under the church is the Grotto of St. Paul, a highly venerated shrine that was originally a Roman prison where St. Paul is believed to have been held in captivity for three months in the winter of A.D. 60–61. South of Rabat are catacombs with underground chambers that contain circular tables for funeral repasts, couches for reclining, and niched graves. Remains of painted decoration in Byzantine-Romanesque style have been found in the underground chapel in the catacomb of St. Agatha. In the area are the underground oratories of Tal Virtù and the Abbatija tad-Dejr (L-Abatija tad-Deir), which resemble Basilian lauras and retain traces of paintings.

At Boschetto, near Rabat, is the Verdala Palace (built 1581–95), with a chapel containing paintings by Mattia Preti. South of Boschetto stands the 18th-century summer palace of the Inquisitor.

Bibliog. V. Bonello, La Notabile, Le vie del mondo, VI, 1938, pp. 591–609.

Vittoriosa. Across from Valletta, on Grand Harbour, is Vittoriosa, originally called Borgo del Castello. Its present name commemorates the defeat of the Turks by the Knights in 1565. During World War II it was heavily bombed. One of the buildings that survived the damage is the Inquisitor's Palace, built at the end of the 16th century and incorporating the 15th-century Castellania with its Gothic cloister. The large church of St. Lawrence, rebuilt by Lorenzo Gafà from an older Sicilian-Norman church, contains paintings by Filippo Paladini, Alessandro Turchi (called "l'Orbetto"), and Mattia Preti. Adjoining the church is a small but interesting museum. The fortifications of Vittoriosa and the neighboring towns of Cospicua (or Burmola) and Senglea are the work of Vincenzo Maculano da Firenzuola and the Piedmontese engineer Antonio Maurizio Valperga. The latter built the Ricasoli Fort (1670), with a monumental gateway that guards the entrance to the harbor. Maculano's fortifications (the Cottonera and Firenzuola), also with massive gates, enclose the three towns within a vast system of defensive walls.

Gozo (Gaudos, Gaulus). A lesser island of the archipelago, Gozo is similar in character to Malta. In Roman times it was a municipium. Near Victoria, in the center of the island, is the ancient citadel, a picturesque medieval town surrounded by high walls dating from antiquity. Set into the wall at the main gate is a great marble block with fragments of a Roman inscription from the Antonine period. The citadel, which now consists almost entirely of ruins and of small cultivated plots, encloses a number of interesting buildings; it is dominated by the majestic Cathedral (designed by Lorenzo Gafà), with a 17th-century façade, and includes the ancient Law Courts, the prisons, the Gozo Museum, a few houses of the Sicilian-Norman period, the ruins of the Bishop's Palace, and some arches in Sicilian-Moresque style. Victoria, the chief town of the island, which lies at the foot of the citadel, has a number of elegant houses with terraces and balconies in finely carved stone. In the parish church are paintings by Mattia Preti.

East of Victoria, near the village of Xaghra (Caccia, or Sciara), are the remains of a large neolithic temple complex, the Ggantija ("Giant's Tower"), which consists of two separate temples surrounded by a common outer wall. The larger (south) temple, built of enormous limestone blocks, is probably the earlier of the two. Nearby are the remains of the so-called "Grotto of Calypso," a huge pile of fallen rocks that originally formed the roof of the cavern. There are some traces of a flight of steps carved from the rock. On the In-Nuffara hill ruins of a Bronze Age village (14th cent. B.C.) have come to light.

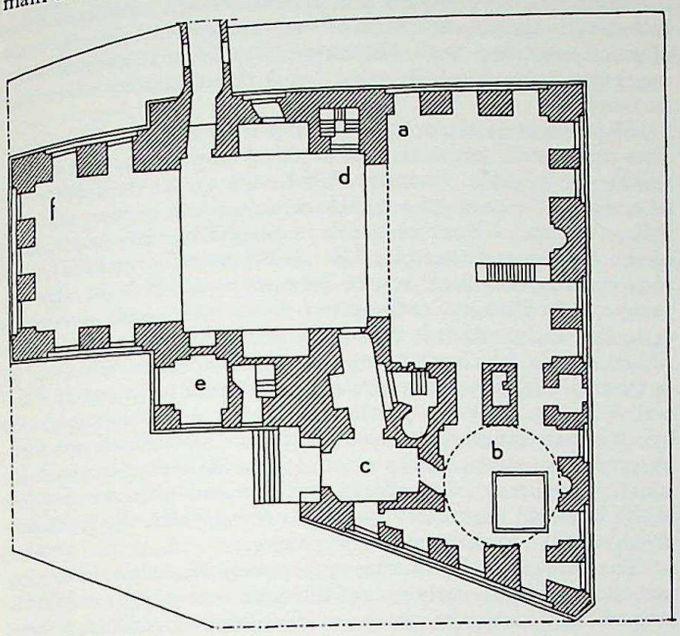
MAMELUKE ART. The artistic activity that took place in Egypt and Syria under the Mameluke dynasty (1250–1517) was brought about by a religious upheaval: the return to Sunnite orthodoxy after the Scythian interlude under the Fatimids (see FATIMID ART). The effect of this reversion was a renewed interest in religious art and, particularly, architecture; and there was at the same time a remarkable increase in richness and variety of crafts and of the minor arts. The entire period was one of great productivity in the arts, and represents an individual and important aspect of the art of Islam (q.v.).

SUMMARY. Cultural components of Mameluke art (col. 419). Architecture (col. 420): *Religious architecture; Civil architecture; Residential architecture; Architectural elements and features.* Decorative arts (col. 425): *The art of the book; Ceramics; Glass; Metalwork; Rugs and textiles; Woodwork; Ornamentation.*

CULTURAL COMPONENTS OF MAMELUKE ART. The mamelukes (Ar., *mamlūk*, slave or captive) were slaves brought by the Ayyubids, and later by the Mamelukes themselves, from Turkistan, Transoxiana, Persia, Caucasia, and other places to serve as soldiers. They rose to power when, with the death of Sultan aṣ-Ṣāliḥ Najm ad-Dīn and the assassination of his son, the Ayyubid rule of Egypt was virtually ended. The widow of the sultan, the famous Shagar ad-Durr, was elected queen by the Mamelukes, who had brought about a palace revolt; but she could maintain her position only by marrying one of their number, Aybak, and making him a sultan — the first of the Mameluke dynasty. The rise of the dynasty, which was beset throughout its history by struggles for power from within, was accompanied by serious external threats. Crusading expeditions were a continuing danger from the West, but the greater peril was from the Mongols of Central Asia (see ASIA, CENTRAL; MONGOLIAN ART), who had swept over Persia and Iraq and were preparing to invade Egypt through Syria. The Mameluke rulers, well aware of the menace, checked the spread of the Mongol empire with a decisive victory at Ain Jalut (1260), thus securing Syria and establishing their supremacy.

Many refugees from Persia and Iraq, fleeing the Mongol invasion, settled in Mameluke territories; among these were undoubtedly artists and craftsmen who brought with them their native traditions. Evidences of their influence can be seen in inlaid metalwork and enamel-painted glass, which, though its origin has not been fully established, was prized during this period. At the same time Chinese and Central Asian influences were reaching the Mameluke countries, either directly, through exchange of commerce, or indirectly, by way of Persia; these influences can be clearly seen in the decorative motifs of certain Mameluke ceramics. Diplomatic and commercial relations between Egypt and some of the countries of Europe, continuous waves of emigration and pilgrimage by Moslems of the West, and Byzantine and Hellenistic survivals in Syria, too, all made their contributions; but foreign influences, although undeniably important, were minor factors in the larger development of Mameluke art, which was primarily religious in nature. This art evolved locally from the Ayyubid tradition — itself an offshoot of Fatimid art (q.v.), exhibiting a highly individual character in the composition of architectural masses and elements, and also in decoration, in which the depiction of the human figure was almost entirely abandoned in favor of calligraphic and geometric ornamentation.



ARCHITECTURE. The dominant influence in Mameluke architecture was religion, and the majority of the existing monuments are of a religious character: mosques, madrasahs (theological colleges), khankahs (*khānaqāhs*, monasteries), and minor buildings such as the kuttab (or *maktab*), a primary school where boys learned reading, writing, and recitations from the Koran. Most madrasahs and khankahs had mausoleums for their founders attached; these were sometimes built separately.

There were also, however, many structures serving civil purposes erected during this period: hospitals, public baths, bridges, aqueducts, animal drinking-troughs, and so on. Residential architecture was well represented by large and small private houses, the *rab'* (tenement block), and the *wakāla* (Pers., *khān*; hostel or storehouse). One well-preserved example of military architecture of the period survives: the fort of Qāit Bey, in Alexandria, the façade of which exhibits medieval European influences.

Religious architecture. Mosques, especially the congregational ones, were designed mainly as houses of prayer but were sometimes used for teaching. Madrasahs were colleges of religious instruction providing living accommodation for students and teachers and often including space for a kuttab on an upper floor. They also served the function of a mosque in that they were used for prayer by the college residents and the people of the neighborhood. Khankahs served almost the same purpose as madrasahs, except that the residents were Sufis — men, most of them unmarried, who devoted themselves to worship and the deeper teachings and philosophy of Islam.

Mameluke mosques were constructed according to either of two principal plans: the traditional, or *riwāq*, plan; and the cruciform, or liwan, plan, which was used mostly for madrasah-mosques. The *riwāq* plan consists of a four-sided open court (*ṣaḥn*), on each side of which is a series of aisles known as a *riwāq*. The *riwāq* of the *qibla* side (the side oriented toward Mecca) is deeper, having more aisles than the others. An early example of the *riwāq* plan is the Mosque of al-Ẓāhir Baybars (1266–69; VIII, FIG. 341*a*), which consists of a large open court or *ṣaḥn*, slightly oblong, with a *riwāq* at each side. The *qibla riwāq*, containing the prayer niche, or mihrab, is formed of six aisles parallel to the wall; a square in the center of the three aisles next to the wall was once covered with a dome. Each of the other three *riwāq*s consists of two aisles parallel to its outer wall, but is also cut in half by a transept. The three entrances to the mosque, placed on the axes of the *ṣaḥn*, are of the projecting monumental type, and the main one formerly supported a minaret. The local elements here are the monumental entrance, the transept, and the building material — stone for the outer walls and brick for the arcades. The imported elements are the design of the sanctuary, which probably came from Mayyafariqin in northern Iraq; the buttressed walls, of either Syrian or western Islamic influence; the interlacing frame in the main entrance, which is Syrian; and the small cusps in some of the window grills, which are western Islamic in style. A later example is the Mosque of Sultan al-Mu'ayyad (Cairo, 1415–20) in which there are three aisles in the *qibla riwāq*, parallel to the

wall, and two aisles in each of the other three *riwāq*s. The east corner of the building contains the domed mausoleum of the founder, and a remarkable pair of minarets are placed on top of the two towers of the Fatimid Bāb Zuwayla. The angular main entrance (a form of dog-leg) is at the east corner of the main

Cairo, plan of madrasah-mosque of Qijmās al-Isḥāqī, 1480–71: (*a*) *qibla* liwan; (*b*) mausoleum; (*c*) vestibule; (*d*) covered *ṣaḥn*; (*e*) *sebīl*; (*f*) liwan.

façade. Some western Islamic influences are exhibited in the ornaments of two stucco blind windows. Connected to the mosque on the northwest side is the bath built by the sultan.

The liwan plan consists of a central open court, usually square, with a wide covered aisle, or liwan, at each side. The full length of the liwan opens onto the court. As the *qibla* liwan is the most important, it is the largest. Mameluke mosques of the pure liwan type are very rare. The mosque of Shaykhū (Cairo, 1349), although basically a liwan plan, is, in fact, a combination of the two types, for each liwan is treated like an arcaded *riwāq*. There is a mausoleum on the south side of the sanctuary, and a minaret rises above the vestibule of the main entrance.

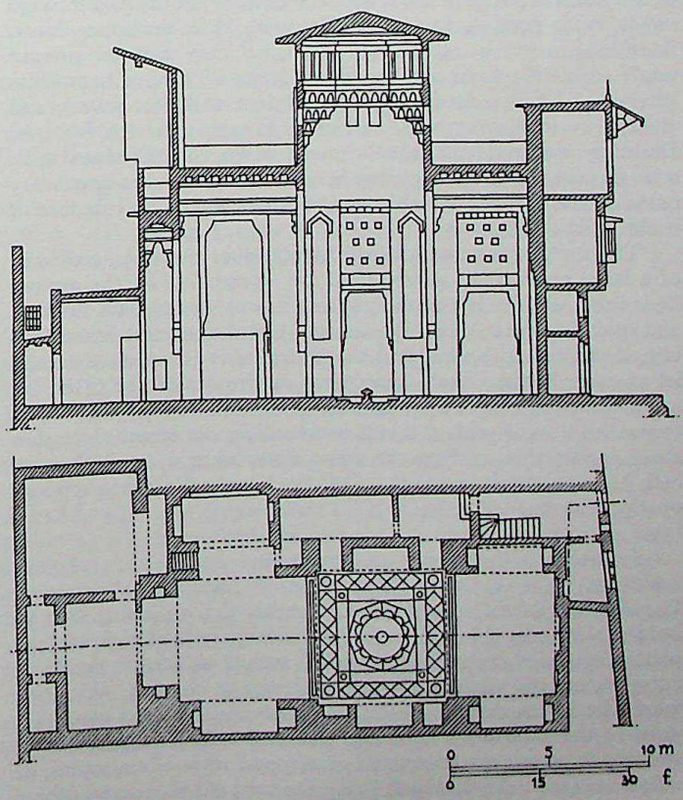
Madrasah-mosques, however, were built exclusively on the liwan plan. A world-famous example is the madrasah-mosque of Sultan Ḥasan (1356–63; PL. 270). Here a vaulted liwan is built on each of the four sides of a large open court, the *qibla* liwan being the largest. The liwans are kept solely for prayer and the corners in between are occupied by four colleges, one for each of the four rites of the Sunnite sect: the Shafiite, the Malikite, the Hanafite, and the Hanbalite. Each college consists of an open small court with a vaulted liwan at one side and rooms above. A huge mausoleum is built behind the *qibla* liwan. The edifice is remarkable for its fine colossal proportions and for the elegance of detail in its architecture and decoration.

In a later, typical, Mameluke example, the madrasah-mosque of Qijmās al-Isḥāqī (1480–81; PL. 270, FIG. 421), the central court is no longer left open but is covered with a wooden ceiling, decorated with painting and gilding, above which is an octagonal skylight. The *qibla* liwan has become a large rectangle parallel to the *qibla* wall; but the opposite liwan retains the old proportions, and the other two have evolved into tall, narrow recesses of shallow depth. The usual elements of the madrasah are present; that is, mausoleum, angular entrance, and *sebīl*.

The madrasah-mosque of Sultan Qalā'ūn (PL. 270) is unusual in that it has only two liwans, a large *qibla* liwan and a smaller one opposite. The other sides of the *ṣaḥn* and the corners are occupied by cells that were used by residents.

The open courts of both *riwāq* and liwan plans were sometimes provided with ablution pavilions in the center.

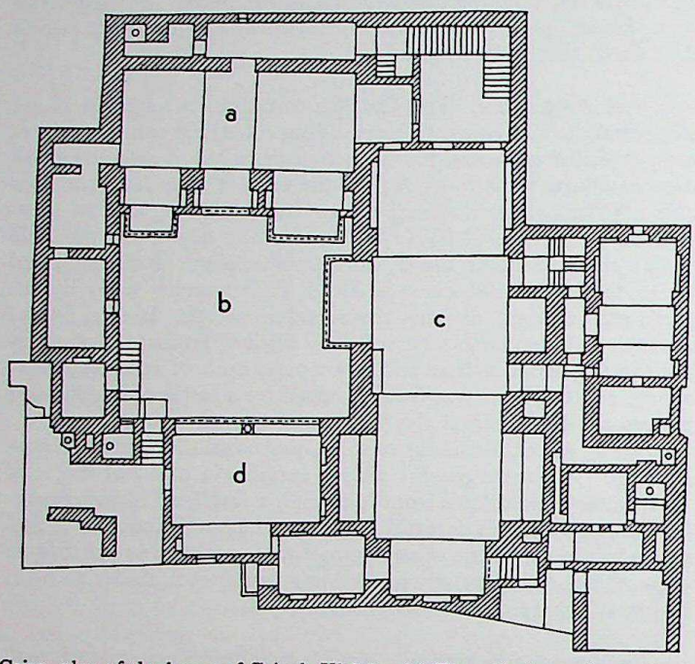
Khankahs were chiefly built on the liwan plan. The khankah of Baybars al-Gāshankīr (Cairo, 1306–10) consists of an open court, two vaulted liwans, and side halls. The building is provided with several *malqaf*s, or ventilating devices, to catch the cool prevailing wind. The other parts of the building are occupied with cells for the Sufis. A mausoleum is built on the left of the typical angular entrance. The cushion voussoirs in the entrance arch and the acanthus capitals are evidence of Syrian influence.



The khankah of Farag ibn-Barqūq (1400–10) in the group of the Tombs of the Mamelukes, in Cairo, is the largest existing, and is also notable for the two graceful minarets on the northwest façade and the two nearly identical domed mausoleums that flank the *qibla* liwan.

Civil architecture. The Qalā'ūn complex (PL. 270) included a hospital, now in ruins. This building contained wards — quarters, both for men and for women, consisting of cells arranged around courts with fountains in the center; rooms for doctors and assistants; dispensaries; stores and kitchens; and so on.

The Aqueduct of al-Nāṣir Muhammad begins on the Nile with a massive intake tower, hexagonal in plan. Water supplied by underground tunnels was lifted from interior wells by sakiehs (Ar., *sāqiya*), or oxen-driven water wheels. It then flowed through an open channel created by thick walls formed of alternate high pointed arches and stout piers built of rusticated masonry, and the level was further raised by a series of sakiehs and towers until it reached the Citadel of Cairo.



*Sebīl*s, public drinking edifices, are usually attached to madrasahs. An underground cistern supplies a basin in the *sebīl* with water which flows from it down a *salsabīl*, an inclined marble slab carved with decorations, and a channel brings the cooled water to the sill of the outside windows for people to drink from cups. The *sebīl* is usually located at ground level, under an open loggia which is used as a *kuttab*.

Residential architecture. No Mameluke house exists intact, but with the help of Mameluke ruins and houses built on Mameluke traditions surviving from the later Turkish period, it is possible to form an idea of their general design. A typical

Cairo, Naḥḥāsīn, the *qā'a* (reception hall) of Muḥibb ad-Dīn, 1350: (*above*) section of the building; (*below*) plan.

Mameluke house (FIGS. 422, 423) was a small labyrinth of rooms arranged in levels around a central court that provided light and air. The main reception area was a great hall, or *qā'a*, formed by a central square space with a skylight. The *qā'a* often contained a marble mosaic fountain. Two liwans, slightly above floor level, were on opposite sides of this central space, the total height of which was greater than one story; and connected to it was a loggia, or *maq'ad* (PL. 274), overlooking the court and open to it in order to catch the prevailing cool winds. The women's quarters were secluded from the reception hall for men, but connected to it by corridors and stairs. Female members

of the household could observe festivities held in the *qā'a* through *mashrabiya*s (grates, or wooden latticework) in the upper floors. *Mashrabiya*s were extensively used, as they assured privacy while admitting light and air. Some houses included bathrooms (preceded by antechambers and supplied with hot water); and stables, storehouses, wells, and cisterns were common features. Building materials included dressed stone for the main walls and façades; and rubble, brick, and wood for the secondary parts of the house. Marble was used for floors and dadoes of main units.

The *rab'*, or tenement block for the poorer classes, consisted of a large open court surrounded by storerooms on the ground floor and, above, by corridors leading to apartments. *Khān*s and *wakāla*s were of similar design, but the ground floors contained stores and shops, and the apartments above were usually let to merchants. Each apartment in the *wakāla* of Qāit Bey at Bāb an-Naṣr (PL. 274) consisted of two floors. The lower contained a *qā'a* with a liwan overlooking the street through a small *mashrabiya*, and on the same floor were a small sleeping cell, kitchen, and lavatory. On the upper floor was a room overlooking the *qā'a*.

Architectural elements and features. Mameluke religious buildings have various elements and features in common. Façades, in general, are simple and rather flat, with scarcely any bold projections. Most have broad surfaces with slightly sunken panels in series containing rows of arched windows, single or coupled, usually with bull's-eye openings at the top. Windows were filled with decorative stucco grilles and colored glass that gave to the interiors a dim and peaceful effect. The hoods of the façade panels are composed of stepped rows of stalactites, or *muqarnas* (see below), which bring forward the recessed surfaces to the front plane. Main stalactite portals, of Syrian origin, are seldom projecting but consist chiefly of porches set within deep, richly patterned recesses and stepped rows of stalactites enclosed within hooded cusps. Later, courses of alternate colors of stone or marble came into favor for façades, and curved and flat arches were often constructed with colored voussoirs and joggles of elaborate design.

Residential façades were also of plain design. Screened windows and projecting balconies of various sizes and shapes, some of which contained small, elegant receptacles for cooling ceramic water vessels, or *qullas*, served to break the monotony of the flat surfaces.

Minarets were important elements of religious architecture. Two types were characteristic of the Mameluke period — the *mabkhara*, so called because of the supposed resemblance of its crown to the cover of a *mabkhara*, or incense burner; and the *qulla*, the topmost part of which is shaped like the upper half of the classic water vessel. The *mabkhara* minaret (VIII, PL. 162) consists of a high square base surmounted either by an octagonal pavilion or, more often, by a short shaft, generally octagonal, above which is the top pavilion crowned with a small ribbed cupola (the *mabkhara*). An interior spiral staircase is lighted by openings set in sunken panels with a variety of decorative hoods. The top pavilion is usually a circular shell cut by slender openings. Base, shaft, and pavilion are each crowned by projecting stepped rows of stalactites skillfully arranged in attractive patterns of pendants and alcoves, and the crowns of the base and shaft carry platforms from which the muezzin, or *mu'adhdhin*, chants the call to prayer.

The *qulla* minaret (PLS. 270, 271), purely Mameluke in origin, first appeared in the early part of the 14th century. Its cubiform base, the top corners of which are chamfered or molded, is surmounted by an octagonal shaft, above which there is sometimes placed another, polygonal or circular, shaft. The topmost part consists either of eight graceful columns, sometimes coupled, or of a circular shell pierced by slender openings. It is crowned, in either case, by the *qulla*. All *qulla* tops have two or more bronze finials of torus moldings carrying crescents that face Mecca. Toward the end of the Mameluke period *qulla* tops acquired curious shapes, as can be seen in two in Cairo: the minaret of Sultan al-Ghūri in the Mosque of al-Azhar and that of the Mosque of Qāni Bey, both of which have connected twin pavilions, square in plan and topped by *qulla*s. All Mameluke minarets were built of stone, except for a few early *mabkhara*s of brick construction.

Stalactites are among the most fascinating elements of Islamic architecture developed since the 11th century. Probably originating in the multiplication of small squinched arches, they evolved during the Mameluke period into a variety of wonderful designs, both simple and complex. Stalactites were used as decorative structural elements wherever possible, especially in corbeling (see also ISLAM, col. 349).

Arches are exceedingly various in form: there are the pointed type, struck from two, three, or four centers; the half round; the keel; and the triangular, the straight, the cusped, and the molded (PL. 272). Voussoirs were mostly of plain masonry, sometimes joggled and, in a few cases, decorated with cushions, cusps, and so on. The horseshoe form, which made its appearance and spread throughout Egypt in the early Mameluke period, evidently came from western Islam; it was utilized for pointed and half-round arches. Arches of open arcades were provided with tie beams for reinforcement at the springing line.

Columns of marble and granite were greatly prized, as they have a greater bearing capacity than masonry. Sultans and emirs obtained them, usually by purchase, from older buildings for use in their own monuments. Often a variety of capitals, shafts, and bases of disparate types and sizes were clustered together, and in order to form columns of equal height it was necessary to shorten shafts or add pedestals. Columns of pure Islamic design, however, were also used. One type, evolved from designs of earlier periods, has a bulb-shaped capital and base (PL. 272) and in outline is an upright *cyma recta* acting as a zone of transition between the square abacus and the circular or octagonal shaft. Another form used for capitals, and sometimes for bases, was the stalactite. This seems to have been a Mameluke invention and varied according to the number and form of

stalactites used. Capitals bearing the classic acanthus motif were also used: an example can be seen in the entrance to the khankah of al-Gāshankīr. It is unlikely that these capitals were taken from older buildings, as they seem to be designed expressly for the space they occupy. A survival of Hellenistic influence emanating from Syria seems to be a much more likely explanation of the motif. The shafts of Mameluke columns, circular or octagonal in form, are sometimes devoid of ornament and sometimes covered with arabesques, interlacings, zigzags, helicoidal flutes, or grooves.

The mimbar (PL. 272; VIII, PL. 88), a raised platform from which the imam delivered the Friday sermon, or *khutbah*, was also used for announcing official orders and reading documents of public interest. Mimbars were generally made of wood and portable, though marble was sometimes used. They were entered through a framed door opening onto a flight of about ten steps that led to the platform. A pavilion above was supported by four columns that carried molded arches, and above these rose a *qulla* with a bronze finial. Decoration varied according to the material used in construction: wood was decorated almost exclusively in star patterns, but various designs were used for marble.

A feature of religious edifices is the mihrab, or prayer niche, a semicircular alcove on the interior *qibla* wall that directs worshipers toward Mecca. In the mihrab the outer arches of the semidome are carried by columns placed in recessed nooks flanking the niche. Simple examples have stucco decorations, but more complex ones are decorated with rich designs in marble and have joggled voussoirs, panels, and friezes patterned in fine mosaics, and arcades set on blue ceramic columns. Glass mosaic was sometimes used for the hood and spandrels, evidently as a result of Syrian influence.

Domes were used to cover tombs. Though they were all, to a degree, pointed, individual forms varied. Until the 14th century most domes were plain inside and ribbed outside (PL. 271); later, when brick was replaced by stone, the exteriors were covered with zigzag, star, and other geometrical patterns, sometimes combined with arabesques, the chief decorative motif of the late period (PL. 273; VIII, PL. 162). The drum, pierced with windows, is usually circular and of the same diameter as the dome, thus increasing the height of the cylindrical part. Occasionally the dome projected beyond the drum, resting on corbeled stalactites, and was reminiscent of the bulbous forms of Persian domes. Like minarets, domes had bronze finials.

The domed roofing system was more or less reserved for tomb construction, but brick or stone vaulted roofs were used for madrasahs, mosques, and khankahs during the early period of Mameluke architecture and for vestibules, corridors, storehouses, tunnels, stables, and the like throughout the period. These roofs employed tunnel and cross vaults, usually pointed, but during the last half of the 15th century a fanlike cross vault began to be used.

Flat wooden ceilings in many fine designs were constructed for *riwāq*s, liwans, reception halls, and other rooms. One type consisted of a series of joists, rectangular at the ends and with rounded or chamfered undersides — the transition being effected by stalactites. The space between the joists was either filled by stalactites or divided into shallow panels of different shapes. Rectangular corbels supported the joists, which surmounted panels of friezes alternating with stalactites. These ceilings were usually painted and gilded in geometric and floral patterns and were sometimes decorated with inscriptions in relief. Another system involved covering the ceiling with planks, upon which were nailed colored and gilded ornamental patterns, and coffers. A third ceiling design, resembling a honeycomb, was constructed by means of a series of octagonal coffers with gilded and painted decoration — geometrical, floral, and epigraphical.

DECORATIVE ARTS. *The art of the book.* Certain illustrated manuscripts, copied and dated in Cairo, suggest that a Mameluke school of painting had once been developed in Egypt. These illustrations exhibit the traditions of the Baghdad school of painting, and yet they contain clear evidence of Mameluke influence. Manuscripts having some traits in common with those mentioned above can thus be provisionally attributed to the same school. It is also interesting to learn that illustrated playing cards were used in the period. Calligraphy (q.v.) and illumination of manuscripts (see MINIATURES AND ILLUMINATION), especially copies of the Koran, became a favorite activity of artists. Very fine specimens, some of great size, are exhibited in the Egyptian Library in Cairo. The opening pages are often elaborately decorated with geometrical and floral ornaments, gilded and painted in attractive colors. Sura titles, written mostly in Kufic script, and the text of the verses in beautiful Naskhi script are alike set on profusely decorated backgrounds. It was customary for valuable texts to be enclosed within bindings of comparable beauty, and the principal material for this purpose was leather, patterned with blind tooling and stamped floral and geometrical ornament. In some cases the designs were composed of a central medallion with arabesques cut on colored backgrounds. The *doublures* usually bore stamped arabesques (VI, PL. 414).

Ceramics. Ceramics of the Mameluke period fall into two main groups. The first, made of local clay which provides a thick, dark brown body, is covered with a transparent lead glaze. The designs were mainly Naskhi inscriptions of names, titles, and good wishes combined with geometrical ornaments and arabesques of the conventional type. Bird and animal motifs were also employed, sometimes exhibiting exceptional vigor, but human figures were rarely used. Blazons of high officials were frequently represented; these resemble somewhat the heraldic shields of medieval Europe. The second group of ceramics is made of a paste derived from a vitreous composition of ground quartz and white clay and was produced from the beginning of the 12th century. This group includes a type of ceramic ware with polychrome geometrical patterns that is attributed to the second half of the 15th century. Contemporary with this style is another, featuring human figures and faces, animals, and birds. The colors are black, blue, red, and sometimes green. Fragments and wasters of copper luster painting on dark-blue backgrounds have been found at Fostat. These and other pieces believed to come from Syria indicate that this technique (PL. 275) was not abandoned in the early Mameluke period.

A well-known category of the second group is the so-called "Sultanabad" type, in which decoration consists mainly of a central animal or bird figure on a crowded background of plant elements — lotus, trefoil, leaf forms, and so on. Though such motifs were originally Asiatic, the main influence was Persian. The colors under the glaze are tints and shades of green and, rarely, of blue, with outlines drawn in black. This category is attributed to the first half of the 14th century. In the 15th century ceramics with designs in cobalt became predominant, and many pieces of this type bear signatures of the great artists of the Mameluke period — Ghaibī, at-Taurīzī, and Ghazāl. In these pieces backgrounds are clearer and figures more elegant.

Glass. Mameluke glass (see also GLASS) achieved universal fame, owing to the technique of decorating with colored enamel paints and gold. This technique began to spread in Egypt and Syria at the end of the 13th century, but its origin has not yet been established. Enameled glass reached its zenith in the 14th century, during which most of these delicate pieces were produced. Cups, plates, bottles, vase-shaped lamps, and jewelry were among the chief products (VI, PL. 227). Designs consisted of bands and medallions filled with Naskhi formulas of good wishes and with stylized or naturalistic floral motifs. Human and animal figures are very rarely seen on lamps but occur frequently on other products. Such figures were influenced by the Seljuk style of painting (see SELJUK ART) on ceramics and manuscripts. Enamel colors were white, yellow, green, blue, and tomato red. Gold was used for outlines, edges, or backgrounds. In the 15th century glasswork began to decline in quality, and centers of glass manufacture produced only inferior imitations of Mameluke work.

Metalwork. Various metalwork objects were executed in iron, copper, bronze, and, in particular, brass. Hanging lamps of assorted shapes — pyramidal, polygonal, and vase-shaped —

were decorated with incised and perforated designs and provided with pendent glass cups containing oil and wicks. Brass candlesticks of typical Islamic form were much used in public and private buildings; many were elaborately decorated by hammering slices and wires of gold and silver into grooves incised in the metal body — a technique that had become a vogue in Persia and Iraq before the Mongol invasions and then spread to Syria and Egypt, where it reached its zenith during the 14th century. Other objects, such as bowls, trays, plates, tables, and ink boxes, were decorated with inlay (PL. 275). Names and titles of sultans and emirs and expressions of good wishes written in Naskhi script formed part of the decorative composition (PL. 275), together with naturalistic floral motifs, mostly of Asiatic origin. Geometrical designs were relegated to background patterns.

Rugs and textiles. It is now acceptable to consider the group of so-called "Damascus rugs" as late Mameluke work. Usually the warp was of silk and the weft of wool; in a few cases silk was used for both warp and weft. Designs consisted of borders of different widths framing a central field containing one or more medallions formed of angular cusps. Decorative motifs were exclusively geometrical, with even floral patterns represented in abstract angularity. The colors used were red, green, and blue.

The production of textiles followed in the local traditions of the Ayyubid period. A characteristic example is a linen cushion cover embroidered in stripes of lozenges with human figures, animals, and birds executed in angular forms. Printed fabrics were also produced, as were silks exhibiting differing tastes and designs. There exists a group of silkstuffs woven in decorated bands and stripes with Naskhi inscriptions alternating with bands of animal figures, the background being filled with naturalistic floral designs. Another group is decorated with a mixture of Chinese motifs and Mameluke inscriptions and designs.

Woodwork. Work in wood was plentiful and various in application; it was utilized for doors, windows, mimbars, Koran chairs and boxes (PL. 275), dinner tables, cenotaphs, screens, friezes, and ceilings. One of the favored techniques employed was the division of surfaces into geometrical designs. The star pattern, composed of small panels of many shapes and sizes joined by slender molded mullions, was predominant. The panels were decorated with floral ornaments carved in wood or ivory, or inlaid with little slices of bone, ivory, and ebony arranged in patterns. Sometimes large surfaces were covered with inlay (V, PL. 458; VIII, PL. 88). Floral motifs carved in wood were only of the conventional stylized type, never naturalistic. Latticework, or *mashrabiya*, used for screens, balustrades, and to cover windows in residential buildings, is composed of bars, square in section and turned on a simple machine in round beads alternating with small cubes. The bars are then linked together by little beads, and the whole panel is enclosed within a strong frame.

Ornamentation. Geometrical decoration, although favored since early Islamic times in both East and West, achieved its final maturity in the Mameluke period in architecture and the minor arts. Of these geometrical designs the so-called "star pattern" is the most important. It was employed wherever possible in carving, painting, inlay, mosaics, and all kinds of decoration. Another great favorite was the arabesque, highly developed by Moslem artists. It consisted of scrolls and undulating, curved and twisted stems bearing leaves of either stylized or naturalistic variety: traditional Islamic abstract forms of the palmette and split palmette; calyx and split calyx; the naturalistic acanthus and its derivatives, evidently of Syrian origin; and the Asiatic lotus and its relatives. Arabesque was used alone or combined with geometrical decorations and Kufic inscriptions. Kufic script (see CALLIGRAPHY), with its angular and graceful forms, was most suitable for decoration and was often placed on a background of arabesque. A world-famous example exists in the madrasah-mosque of Sultan Ḥasan in Cairo. Animals, birds, and fish were sometimes used in illustrations but were more often employed as decoration; in both cases they usually appear in abstract forms typical of Islamic art. Human figures were included among other decorations and were generally represented in abstract style (see HUMAN FIGURE; IMAGES AND ICONOCLASM).

MANET, EDOUARD. French painter, born in Paris on Jan. 23, 1832, of an old and well-to-do bourgeois family. In 1844 he entered the Collège Rollin, where he distinguished himself only in athletics and drawing. In deference to his father he decided on a naval career, and in 1848, to prepare for admission to the Ecole Navale, he embarked as a cadet on a merchant vessel bound for the South Seas; the voyage lasted six months, of which two were spent in the harbor of Rio de Janeiro. By the time he came back, his notebooks filled with sketches, he had a sure sense of his true vocation. In January, 1850, he enrolled in the studio of Thomas Couture, a painter high in official favor, together with his good friend Antonin Proust, whose recollections provide a vivid and authentic source of information on the artist. From Couture Manet received a solid grounding in his craft, supplemented by

visits to the Louvre, two study trips to Italy (1853 and 1856), and a tour of the museums of Holland, Germany, and Austria (1856). He copied some of the great old masters: Titian, Rembrandt, Velázquez; among modern masters he was drawn to Goya, Delacroix, Courbet, and Daumier. He left Couture's studio in 1856.

Manet was still a schoolboy when, commenting on a remark of Diderot's, he expressed what was to be one of his guiding principles: ". . . we must be of our time and work with what we see." It is with him rather than with Courbet (whose anticipatory role, however, must not be slighted) that modern painting begins — painting free of anecdote and false conventions, painting attuned to the new rhythm of life, bound solely by its own laws. As Matisse recognized, "He was the first to act by reflex and thus to simplify the painter's task . . . expressing only what immediately touched his senses." From eye to hand, from sensation to transcription, nothing extraneous, no intervention of the sentimental or the picturesque. The impressionist movement, which Manet inspired but with which he only in part identified himself, derived from him its technical emancipation and its chief characteristics: naturalness and freedom, modern themes, clear light, a direct, instantaneous visual grasp. Yet no artist ever appeared less revolutionary than this accomplished man of the world. Elegant and sociable, steeped in tradition, he aspired to nothing more than official acclaim and the honors of the Salon. It was by no intention of his own that he aroused controversy; the violent reaction of the public to his work surprised and pained him. As if to excuse himself, he said: "It is an effect of sincerity that some works should take on the character of a protest when the painter has merely thought of conveying his impression, simply tried to be himself and not somebody else."

Stress has often been laid on the paradox of Manet's art — highly innovative though enriched by borrowings — and the duality of his nature, a subversive bent masked by the appearance of conformism and the superior detachment of a dandy. Brilliant, witty, cultured, most charming, enamored of music and literature, equally at ease in high society and Bohemia, he was an intimate friend of the two greatest French poets of his time, Baudelaire and Mallarmé.

His personality quickly asserted itself, transcending the diverse influences he assimilated. *The Absinthe Drinker* (Copenhagen, Ny Carlsberg Glyptotek), his first realistic painting, powerful and simplified, Baudelairian in spirit though somewhat melodramatic, failed ignominiously at the Salon of 1859. Only Delacroix, whom he had visited in 1857, voted for him. The spirited *Guitarist* (New York, Met. Mus.), on the other hand, earned him a medal at the Salon of 1861 and, because of its picaresque subject, the enthusiastic praise of Théophile Gautier. The stylistic novelty of this painting, decisive for the evolution of Manet's art and of modern art as a whole, lies in the suppression of half tones and of the traditional chiaroscuro, dependent on a dominant value, in favor of straightforward, bold contrasts. Encouraged by his success, his encounter and friendship with Degas, and the admiration of young artists such as Alphonse Legros and Fantin-Latour, Manet painted an ambitious series of works in 1862. Victorine Meurend, for a long time his favorite model, posed for his *Street Singer* (Boston, Mus. of Fine Arts) and *Mlle Victorine in the Costume of an Espada* (PL. 276). The marriage in 1853 of Napoleon III with a Spanish beauty had revived that fashion for things Hispanic born of romanticism and realism, nurtured by literature and the numerous traveling companies of singers, dancers, musicians, and *toreros*. Manet, very responsive to the fluctuations of fashion, willingly bowed to it in his subjects and technique. He painted the *Ballet Espagnol* (Washington, D.C., Phillips Coll.) in the spacious studio of his friend Alfred Stevens, where he gathered the company after having made preliminary studies at the Hippodrome. The presentation has life and savor, but the figures, remarkable individually, are out of proportion and poorly related to one another. Because of "the fury," as Mallarmé put it, "that flung him onto the empty canvas, confusedly, as if he had never before painted," he sometimes showed, in spite of his virtuosity, unevenness and a difficulty in mastering compositions with several figures. More successful are his single portraits, such as *Lola of Valencia* (IV, PL. 280; V, PL. 120), the "rose and black jewel" celebrated by Baudelaire. Manet's preoccupation with Spanish subjects, which waned in 1863 but revived in 1865, after a trip to Spain, might be dismissed as an exotic phase had it not been supported by a genuine understanding of Spanish masters. In his youth he surely saw the celebrated collections of Louis Philippe and Marshal Soult before they were dispersed and, on his trip to Vienna, the fine examples of Velázquez owned by the Hapsburgs. Moreover, he drew repeatedly on the engravings of Goya, a series of which was published in 1859. His absorption with Spanish and Venetian paintings led Manet to his own direct and simplifying style.

Yet another important work dates from 1862: *La Musique aux Tuileries* (London, Tate Gall.), the first realistic rendering of a contemporary urban scene, painted — without anecdote or allegory — in a sensitive, imaginative manner, in that "open-air *salon*," the Tuileries of Manet's day. Suddenly he discovered the unrecorded spectacle of his city and his time, an enchanting procession of forms and lights; he discovered the poetry of modern life dreamed by Baudelaire, who, in fact, is portrayed in the elegant crowd with the artist's other friends. "With Manet the eye played such a role," Antonin Proust tells us, "that Paris has never known an idler who idled to better purpose"; in a notebook he would take down fleeting impressions, mere nothings — a hat, a profile — in bright and vivid strokes.

After a one-man show at the Galerie Martinet in 1863, Manet became with the *Déjeuner sur l'Herbe* (Paris, Mus. du Jeu de Paume; cf. study, VII, PL. 416) the star of the Salon des Refusés and the rallying point of the young independents in revolt against academicism. This composition, sharply criticized as indecent illustration, is actually in the classicizing tradition of Giorgione and Raphael, but situated, as Manet said, in the "transparency of the atmosphere"; the presentation is nonmythological, bluntly alive and real. Although in 1864 Manet won favor with some still lifes of fruit, fish, and flowers, notably a series of peonies rendered in a highly voluptuous palette, in 1865 the uproar reached a climax when *Olympia* (PL. 278) was exhibited at the Salon. The public was horrified by the subject, took offense at the black cat, whose presence is strictly pictorial; the critics denounced the absence of shadows and of modeling, the use of clear tones — the audacities, the demands of a new style. Manet rightly considered this work his masterpiece. The means are simplified in the extreme; plastic and expressive values are reduced to purely pictorial ones. Crystallized in her whiteness, abstract and yet alive, Olympia appears before us in her unclad majesty, her sovereign indifference, partaking of that life of idols and not of the flesh that style confers on the highest creations of art. The multicolored bouquet held by the black slave foreshadows Fauvism.

Exasperated by the general ill will and incomprehension, Manet took refuge for a few days in Spain, where he met the critic Théodore Duret. He acquired a taste for bullfighting, and he convinced himself that Velázquez was "the painter of painters." On his return he abandoned the elegant Café de Bade and Café Tortoni for the Café Guerbois, to which he attracted avant-garde writers and artists. After some overliteral interpretations of Velázquez, such as *The Tragic Actor* (formerly New York, George W. Vanderbilt Coll.), he executed in 1865–66 three magnificent variations on the theme of bullfighting (Chicago, Art Inst., PL. 276; Tokyo, Matsukata Coll.; Paris, Goldschmidt-Rothschild Coll.) and a brilliant technical feat, *The Fifer* (Paris, Mus. du Jeu de Paume), his most popular and representative painting, which consists of large areas of clear color — like playing cards, Daumier remarked — against a monochrome gray background. No more half tones or modeling; the shadows hug the vibrant contour, which encloses the silhouette without giving it roundess and animates without dissolving it. Here is a bold and original synthesis of the catalyzing influences from Spain and from the Japanese prints discovered with enthusiasm by Manet's whole generation. The novel charm of Japanese art, which in different ways was also to affect Gauguin, Van Gogh, and the Nabis, resided for Manet in its

decorative freshness, its rhythmic outlines, its spatial simplifications, its abrupt contrasts of light and dark. Photography — Manet, like Degas, was an amateur photographer — also contributed to the complex formation of his style.

Rejected by the Exposition Universelle of 1867, he organized on Place de l'Alma his own pavilion, opposite Courbet's, and drew the jeers of the multitude and the admiration of the future impressionists. At the Salon of 1868 he exhibited the *Portrait of Zola* (PL. 276); the novelist had been his warm supporter since 1866. Although Manet was hostile to history painting and did not forgive Delacroix's concessions to the genre, current events inspired him on several occasions — a testimony to his humanitarianism and his liberal convictions. In 1867 he painted the *Execution of Maximilian* (Mannheim, Städtische Kunsthalle), an interpretation of sober pathos. In the summer of 1868, while vacationing in Boulogne, where he was to paint several beach scenes the following year, he began *The Luncheon* (Munich, Neue Staatsgalerie), his most harmonious and relaxed composition, accepted at the Salon of 1869 at the same time as *The Balcony* (VII, PL. 433). The second painting was inspired by Goya and concluded Manet's Spanish period, before the succeeding impressionist phase. There are harmonies of extreme boldness here — metallic greens against pearly grays: Manet's hallmark — but the central mass remains indistinct in the gloom of the background, and each of the figures has a life apart. In the foreground is Berthe Morisot, who often served as his model before becoming his sister-in-law in 1874. In the summer of 1872 alone he painted four portraits of her, of which the one in the black hat (Paris, Coll. Mme Ernest Rouart) was particularly valued by Valéry.

After the War of 1870, in which he served as a lieutenant of the Garde Nationale, he joined his family in the Pyrenees, where they had taken refuge. The way home took him by easy stages along the Atlantic coast, and he painted wide fluid marines, of which the finest is the *Harbor of Bordeaux* (Zurich, Heirs of E. Bührle Coll.). Since 1869, doubtless under the influence of Berthe Morisot, he had turned to plein-air scenes. From Berck he brought back a whole group of paintings and aquarelles rich in effects of transparency and vibration. In Paris, under the limpid light of waning summer, he extended his new manner to figure compositions. Victorine Meurend, the model for *Olympia*, posed for *The Railway* (Washington, D.C., Nat. Gall.), a brilliant painting done in a single burst of inspiration in the garden of the painter Alphonse Hirsch. In the *Game of Croquet* (Frankfort on the Main, Städelsches Kunstinstitut) the fusion of figures and atmosphere is even more complete. The movement of reflections and shadows pervades the scene, without, however, impairing the firmness of the contours, a quality peculiar to Manet that contrasts with impressionist evanescence. In 1873 he executed the nocturnal counterpart of *La Musique aux Tuileries: Masked Ball at the Opéra* (New York, Mrs. Doris D. Havemeyer Coll.), according to Mallarmé a work of capital importance in the painter's *œuvre*, in which the magic of this fete is evoked in all its splendor and its emptiness.

The Salon being the only battleground Manet recognized, he refused to participate in the first exhibition of the impressionists in 1874. But in the summer, during his stay at Gennevilliers on the Seine, he often joined Monet at Argenteuil, on the opposite bank, recognizing without quite adopting the impressionist painter's principles. Manet practiced neither pure landscape art nor the prismatic division of tone. Nonetheless, the richer and more luminous canvases done under impressionist influence in August, 1874, bespeak his rapid absorption of the new style. They include pictures of Monet surprised in his garden or in the boat that served him as a floating studio, two landscapes depicting the banks of the Seine, and two spacious compositions saturated with sunlight, showing pleasure boaters. In these last paintings the same picturesque couple in particolored clothes poses in the forefront — full face and rather stiff in *Argenteuil* (Tournai, Mus. B. A.), in profile in the livelier, more dynamic and unified *Boating* (PL. 277). Drenched in the radiance of the atmosphere, the figures henceforth take form through color, not contour. With almost miraculous ease Manet achieved the synthesis of incompatibles, image and light. From a brief trip to Venice in September, 1875, he brought back two bold paintings (San Francisco, Mrs. William H. Crocker Coll.; New York, Mrs. J. Watson Webb Coll.) in which his individual approach harmonizes with the happiest effects of the impressionists.

His production in later life was more abundant but less even than in his youth. His technical virtuosity remained exceptional, but his work, affected by the contradictory claims of naturalism and worldliness, lost something of its boldness and unity. Whenever he recovered the firmness of his style and drew on his best source of inspiration, that of contemporary life, he still produced some masterly genre scenes. Among these are three characteristic paintings of 1877 — *The Plum* (New York, Arthur Sachs Coll.), *Skating* (Cambridge, Mass., Fogg Art Mus.), *Nana* (Hamburg, Kunsthalle) — and two fine compositions of 1879 — *The Conservatory* (Berlin, Nationalgalerie) and *Chez le Père Lathuille* (Tournai, Mus. B. A.). Before leaving his studio on the Rue de St-Pétersbourg in 1878, Manet wished to preserve the memory of the Rue Mosnier (now Rue de Berne), which his windows faced and which he had had before his eyes for six years. The five successive versions he made, different in details, are his best urban views and his best essays in impressionist style. Immediately after, he devoted an equally felicitous cycle of paintings and drawings to the *brasseries* and café concerts then coming into fashion. Several represent the Cabaret de Reichshoffen on Boulevard Rochechouart, among them *La Servante de bocks* (London, Tate Gall.), notable for the transparency of the lights.

From 1879 onward, overtaken by the first symptoms of the illness that was to cause his death, he often resorted to the more easily handled medium of pastel, whose stylistic and technical possibilities he enlarged, at the same time as Degas, to portray Parisian celebrities and all the pretty women who flocked to his studio on the Rue d'Amsterdam. Summers he spent in the country, in the gardens of Bellevue, Versailles, and Rueil, painting uninterruptedly, with feverish haste, as his paralysis worsened. Early in 1881 he projected four paintings of women symbolizing the seasons. He executed only two, *Autumn* (Nancy, Mus. B. A.), the model for which was Méry Laurent, and *Spring* (New York, Mrs. Harry Payne Bingham Coll.), posed by the young actress Jeanne de Marsy. One of Manet's most radiant portraits and his first popular success, *Spring* was presented at the Salon of 1882 together with *Bar at the Folies-Bergère* (London, Courtauld Inst. Galls.), a vast composition that, drawing on all the resources of his resplendent palette, evokes the whole phantasmagoria of Parisian night life. A sketch of the same subject is in Amsterdam (PL. 279). He dreamed of decorating the Hôtel de Ville with a mural to the glory of Paris and modern civilization, but, confined to his bed, he had strength only to paint the delicate bouquets, roses and lilac, sent him by his charming women friends. He died on Apr. 30, 1883. "He was greater than we thought," said Degas on leaving the little cemetery at Passy where the artist is buried. "To this day," concedes André Masson, "all freshness, all daring, owes him a debt of gratitude."

MANICHAEAN ART. Widely diffused in Central Asia and China from the 7th century, Manichaeanism was responsible for a wave of Iranian cultural influence, for which there is ample documentary evidence in the eastern part of Central Asia. Although its impact cannot be compared with that of Buddhism (q.v.), Manichaeanism did influence certain tendencies of the art of Central Asia (see ASIA, CENTRAL), either because of its color symbolism or perhaps because the very reputation of Mani, considered a painter of remarkable talent, brought about a traditional and almost sacred interest in the pictorial arts. The Manichaean miniatures of the Turfan area (see TURFAN) are of special interest to the art historian, not only because of their indisputable esthetic merit, but also because sundry historical factors led to their influencing the development of the Islamic miniature. The Manichaean miniatures were both an immediate source of inspiration and a varied, but not overly dissimilar, link in the chain of transmission of Iranian pictorial tradition. Manichaeanism introduced this Iranianism to the Uigurian Turks, whose art in turn constituted an important factor in the genesis of the Islamic miniature.

SUMMARY. The Manichaean doctrine (col. 433). The spread of Manichaeanism (col. 435). Centers of Manichaean art (col. 436). Frescoes: Bezeklik and Khocho (col. 437). Paintings on silk (col. 439). Paintings on paper and miniatures (col. 439). Dating and characteristics (col. 442).

THE MANICHAEAN DOCTRINE. Mani (Gr., Manes; Lat., Manichaeus) was born in northern Babylonia in A.D. 216/17; he received divine revelations in 228/29, and in 240/41 began the work of preaching his new religion. As to his somewhat obscure relations with the Sassanid rulers, suffice it to say that, accused of heresy by Bahrām I and the Magi, Mani was arrested and condemned. He was executed in chains soon after, on Feb. 26, 277.

His doctrine developed in part out of his journeyings through various regions, including India, from which he gathered and readily assimilated many religious and philosophical influences. Mani actually proclaimed himself the last of the celestial messengers, the supreme revealer, and the seal of the prophets (the latter an appellation also used by Mohammed; Koran, XXXIII, 40), recognizing as his principal predecessors (apart from Adam) Zoroaster, the Buddha, and Jesus. He therefore constituted, as it were, the terminal link in a chain. As the perfect illuminator, and in his capacity as savior, he can be likened not only to the Paraclete of Christian theology, but also — though to a lesser degree — to the Bodhisattva Maitreya. Mani claimed that the word preached by him was of a universal nature and ascribed the limited territorial expansion of preceding doctrines to the fact that they had been based upon an incomplete truth. Hence his assertion: "My hope will go to the West as well as to the East." On this basis of superiority or universality rested the missionary character of Manichaeanism. Its doctrine was contained in seven works which, according to Mani himself, were fundamental to the new religion and, as sacred canons, must remain unaltered; for, in Mani's view, Zoroastrianism, Buddhism, and Christianity (qq.v.) declined precisely because the oral teachings of their respective founders eventually became distorted.

This premise of universality in turn determined the syncretistic character of Manichaeanism, which incorporated various elements of Christian, Zoroastrian, and Buddhist philosophy acknowledged as in harmony with the truth. But Manichaeanism cannot be regarded as merely a syncretistic system. H. C. Puech recognizes in it, above all, a capacity to adapt to the most varied environments without losing any of its soundness ("Manicheismo," *Civiltà dell'Oriente*, III, 1958, p. 271). On the contrary, adds this French scholar: "The Indian, Iranian, Christian, and Hellenic elements to be found in greater or lesser degree in Manichaean writings appear to be, for the most part, not so much innate components of the system as, rather, subsequent and secondary layers, the result of a conscious and voluntary adaptation." Manichaeanism is, of course, a variation of Gnosticism; despite the criticisms Mani leveled at the systems of Bardesanes and Marcion, the influence of their doctrines is quite unmistakable in several instances. The very structure of Manichaeanism coincides fundamentally with the Gnostic attitude, in its deep-seated dissatisfaction with the human condition, man being perpetually tainted with evil and yet aspiring to supreme good. The problem of evil — resolved by attributing its source to a principle, in itself bad and inferior but as a power opposed to God, who is solely truth and goodness — becomes an essential factor. It is only through an understanding of self and a knowledge of God that man can save himself. The consubstantiality of God and souls, which are luminous particles of the divine substance, constitutes another basic tenet of the Manichaean system; it is precisely the spirit, or intelligence, which can redeem this small portion of the divine essence by releasing it from its momentary state of degradation. In short, only knowledge — gnosis — enables man to recognize his destiny, his mission, and the background and causes of his very contradictory human condition.

This knowledge is of a total nature, embracing at once theology and cosmogony — things divine, terrestrial, and infernal — and develops in terms of mythology. Thus there grew up a gigantic myth — continually expanded by later exegeses — whose eternal protagonists are the decayed human soul and the intellect which strives to free it. The divine, luminous substance is at once savior (in the form of the intelligence) and object of salvation (the soul as such). The myth itself, naturally based on the contrast between good and evil and the various other opposites (spirit and matter, light and darkness, etc.) proceeding from this primeval dichotomy, is divided into three different phases of time: past, present, and future. Hence Manichaeanism is known as the doctrine of the two principles, or roots, and the three ages, or periods. The Realm of Goodness, or Light — presided over by the Father of Greatness, who is sometimes identified with the Zurvan of Mazdaism — is opposed to that of Darkness (matter or evil), ruled by the Prince of Darkness, who is comparable to the Ahriman of Iranian tradition. The former, as Puech observes (op. cit., p. 274), "is pictured as a sphere of light, surrounded by a resplendent ether and consist-

ing of five abodes, or members of God (intelligence, reason, thought, reflection, and will), inhabited by innumerable Aeons. Conversely, the opposing realm consists of five superimposed abysses (starting from the top, the worlds of smoke, or fog; of consuming fire; of air, or destructive wind; of water, or mud; and of darkness), presided over by five regents, or Archons, of monstrous form — bestial or demonic — and crawling with five different sorts of infernal beings." All the attributes of the Realm of Light are the opposite of those of the Realm of Darkness.

According to the myth, the conflict between these two realms reached its climax with the attempt of Darkness to invade the Realm of Light. The Father of Greatness meets his adversary in person by sending to the fray his own soul, personified in his son, who is also Primal Man. Defeated, the latter falls headlong into the abysses, and so a part of the divine soul becomes mixed with matter. In the course of a series of symbolic events, during a second emanation from the Father of Greatness, the Spirit of Life is "awakened" (i.e., created) and descends into the Realm of Darkness to deliver the Primal Man, who is brought back to his place of origin: the Paradise of Light. However, Primal Man, the first being to fall and the first to be saved, has left his soul behind in the Realm of Darkness. Its redemption necessitates the creation of the material universe, an event in which the Spirit of Life, having overcome the demonic Archons, also plays an essential part. The myth — becoming ever more complex and involved, though certainly not without an intensely poetic strain — proceeds through subsequent phases which describe fresh dangers and further conflicts, the rational and almost mechanical ordering of the life of the cosmos, and atrocious apocalyptic scenes, to the redemption of Adam by a savior who is sometimes called "Luminous Jesus." Nevertheless, except for those who practice absolute continence, the decay of souls will not cease before the end of time; the last phase will mark the definitive separation of the light from the darkness.

This forceful effort of imagination and intellect is directed toward proving not only the consubstantiality of man's intelligence and his individual self with God, but also the possibility of redemption. Salvation consists in regaining an understanding of oneself (thanks to Mani's revelations), in order to be able to maintain one's soul in a state of lucidity and to remain perfectly detached from fleshly impurities and material lusts. Only thus will man be able, at his death, to return to the Paradise of Light, there to enjoy the peace of Nirvana.

Finally, the Manichaean doctrine also contains some extremely rigid moral precepts that can be followed in entirety only by the Elect, who are destined to be saved at the end of their earthly existence. For the others, rebirth, conditioned by their respective merits, is inevitable. Furthermore, the belief in the existence of a soul — not only in human beings, but also in animals, plants, the elements, and even in inanimate objects — doubtless constitutes one of the more interesting tenets of Mani's religion, a religion whose missionary spirit and sense of predication and apostolate clearly reflect the spiritual attitude of its founder.

Mario Bussagli

THE SPREAD OF MANICHAEANISM. According to tradition, Mani began his mission with a journey to India, between 240/41 and 242/43, either in order to gain firsthand knowledge of Buddhist beliefs, or because he wanted to follow in the footsteps of the apostle Thomas and convert the Christians of those regions to his own faith. In any case, having returned to Persia, between 244 and 261 he organized a number of missions, one of which won over Bactria and perhaps even Sogdiana. Moreover, in consequence of the founding of important communities in those regions, numerous missionaries went farther and farther east until finally they reached China.

Up to the 10th century the sect was centered in Babylon, but with the establishment of the Abbasside caliphate (see ABBASSIDE ART), this seat was transferred to Samarkand, because Manichaeanism had by then lost most of its adherents in the West, whereas, since the 7th century, it had gained a tremendous following in the East.

Eastward expansion may have been furthered by the conquest of present-day Chinese Turkistan (see ASIA, CENTRAL) by T'ang China (see CHINESE ART) and by the consequent restoration of safety along the routes leading east. The Manichaeans must have founded small communities along the two routes through Serindia, as doubtless the Nestorians (see NESTORIAN ART) also did; in 694, these communities enabled a Manichaean dignitary to reach the court of China. It is also possible that the expansion toward the east was linked with successive waves of Sogdian migrations toward both Semirech'e and Serindia at the time of the Arab invasion, some groups having preferred to abandon Sogdiana rather than renounce their faith. However, these communities presumably would have made only sporadic contributions toward any important artistic developments in Central Asia without the conversion to Manichaeanism, in 763, of the ruler of the Uigurs, whose capital was Kara Balghasun in the Orkhon River region, and, with him, of the great majority of his grandees and his people.

The Uigur empire (see TURKISH ART), established in Outer Mongolia, disappeared without leaving any traces — apart from the famous trilingual inscription carved during the reign of the Khan Ai-Tängridä-qut-Bulmish-alp-Bilgä (808–21) — to show the level of civilization attained by this people. In 840, the invasion and destruction of their empire by the Kirghiz from the region of the Yenisei forced them to settle in the oases of northeastern Serindia, where they came under the influence of the sedentary Indo-European population; it was only then that the Uigurs adopted a way of life propitious to the flowering of an indigenous art. Ousted from their empire in Mongolia, the majority established themselves in 843 at Khocho (Kara-Khōja; Chin., Kao-ch'ang), on the site of present-day Turfan (see TURFAN); farther north at Besh-balik (The Five Cities; formerly Pei-t'ing); at Yen-ch'i, or Agni, which later became Karashahr; and at Kucha (see KUCHA); the remainder settled in the region of Kan-chou in about 860. Only the western group — at least in so far as is known — contributed to the maintenance of certain art forms, adapting them to their Manichaean beliefs; but even this lasted for only a relatively short time, for, in all probability, the Manichaean frescoes of Bezeklik and Khocho date from about the 9th century, while some of the paintings may have been executed at the beginning of the 10th century.

A characteristic aspect of Manichaeanism was its veritable cult of the book. Having perceived that the religions of his time had suffered a rapid decline — in many cases because of differing interpretations and redactions of their scriptures — Mani resolved that his doctrine should be recorded in books written by himself. These books, seven in number, having been long forgotten, are now known, although imperfectly, from fragmentary discoveries made at the end of the 19th century and the beginning of the 20th in the Turfan area and the repository at Tun-huang (q.v.); these finds have since been supplemented by others at Medinet el-Fayum in 1931. The texts found in Central Asia are in such diverse languages as Chinese, Uigur, and the various forms of Iranian — Persian, Parthian, and Sogdian — while those found in Egypt are in Subakhmimic Coptic.

Mani was said to have been a calligrapher and painter — a repute corroborated by discoveries made in Central Asia, for a number of the fragments found there are not only written in elegant calligraphy but also adorned with illuminations and miniatures probably executed in a style that goes back to the founder of the sect (PLS. 281, 282, 284, 287). These manuscripts constitute a series of invaluable documents, together with the records supplied by the Bezeklik and Khocho frescoes, the latter consisting only of a few fragments in very poor condition because of technical deficiencies in their execution. Unfortunately, the Medinet el-Fayum manuscripts have neither illuminations nor miniatures, so that it is impossible to determine whether a uniform Manichaean pictorial tradition existed throughout the regions in which this sect had adherents.

CENTERS OF MANICHAEAN ART. The Turfan oasis comprises such extremely varied sites as the ruined cities of Idikut-shahri and Khocho, ancient capitals of the kingdom of Turfan, and monastic complexes situated at a greater or lesser distance from

these cities. A number of fragments of Manichaean manuscripts and works of art were found in Khocho, in two groups of buildings designated with the letters K and α. In addition, a relatively well-preserved page from a manuscript was found in one of the numerous monasteries, temples, and stupas located in the gorge of Senghim (Senghim-aghiz; I, PL. 490), which opens a few miles northeast of the plain in which the two cities rose; several Manichaean frescoes were discovered at Bezeklik, a monastic city situated at the head of the valley and consisting of rock-cut sanctuaries and temple structures; a manuscript with a Manichaean miniature was found at Murtuk, another monastic complex comprising rock-cut sanctuaries and brick buildings, located about 25 miles north of Bezeklik; finally, more manuscripts were recovered about 10 miles east of Khocho, at Toyuk, the site of two very large monasteries.

FRESCOES: BEZEKLIK AND KHOCHO. The Manichaean frescoes that survived at Bezeklik were located in two rock-cut sanctuaries (Caves 17 and 25); these frescoes had been concealed by the Buddhists, who covered them either with a brick wall faced with plaster or simply by means of a coating of mud plaster mixed with chopped straw. It seems reasonable to assume that Bezeklik was first a Buddhist site, for the Buddhist decoration in some of the sanctuaries clearly dates from the early T'ang period (7th cent.); it was not until after the conversion of the Uigurs to Manichaeanism — that is, sometime after 760 — that the decoration in a few of the sanctuaries must have been changed, only to be restored in about 850 to its original, Buddhist character. (Cf. I, PLS. 485, 488, 489.)

Cave 25 is the most noteworthy sanctuary, although some of its Manichaean frescoes, having been "prepared" merely with a thin layer of lime, have succumbed to humidity. When the cave was reconverted upon its recovery by the Buddhists, the rear, which communicated by a passage with Cave 26, was walled off and the front part rededicated to the Buddhist cult. It was in this walled-off area at the back that the Manichaean frescoes remained, those on the right wall being still visible when A. Grünwedel studied them in 1905.

On the upper part of the back wall, which has a slight batter and constitutes a sort of pediment, is one of the most important of the surviving frescoes, although it is badly damaged. Grünwedel, who recognized its non-Buddhist character, gave a compendious description of it, pointing out that the wall had been merely whitewashed, that the treatment of the figures — outlined in India ink without any preliminary sketching — was fairly loose, and that only three colors had been used: bright red, green, and dull yellow. The fresco, a rigidly symmetrical composition, shows twelve figures, six on either side, under a tree with three trunks; the roots are sunk in a small basin, and there are three huge clusters of fruit hanging from either side of it; four figures kneel in the foreground, and two others stand behind them in each of the two groups of figures, which are arranged in absolute symmetry with the trunks of the sacred tree. Many of the details of the garments of these figures recur in compositions found at Turfan and Tun-huang and in the cities of the Tarim Basin. The entire composition is bordered along the lower edge with a wide red band.

Some of the Khocho frescoes were found in a monument designated by German archaeologists as "Ruin K" (a plan of it was made by A. von Le Coq, 1913), which was situated slightly to the south of the center of the city, and others were discovered in a ruined complex, designated as "Ruin α," located in the southwest corner of the city, not far from its fortified outer wall. The latter ruin is the cella of a temple which strongly resembles the open-air Buddhist temples with surrounding galleries and, in fact, may even have been a Buddhist temple.

Ruin K consists of four groups of structures. The north group comprises four square rooms with domed roofs, of Iranian type, arranged on either side of a central alley and flanked by smaller, barrel-vaulted rooms; two beautiful Manichaean miniatures were found in one of these small chambers. The only remains of the east group, which was almost totally destroyed, are a barrel-vaulted passageway, in which two votive banners (PL. 286), pieces of embroidered material, painted silks, and a few book covers were found; a square room — originally with a domed roof and adorned with wall paintings — which was thought to have been a library because of the numerous manuscripts it contained; and a few minor rooms. Nothing was found in the west group, which consists merely of a large, square, domed chamber; but the south group — consisting of a row of three large, rectangular, adjoining halls — yielded two objects of particular importance: a wooden column base, carved in a highly characteristic style, in the north hall, and a large wall painting in the middle hall.

Ruin α contained many manuscripts (among them a page illuminated on both sides, the most beautiful of the miniatures found at Turfan), as well as a wall painting, representing the elect, in a corner of the chamber.

The most important of the Khocho frescoes is one located on the west wall of the hall in the center of Ruin K. It depicts, against a clear gray background, a group of men and women dressed in white (probably the elect), a few lay figures (undoubtedly "auditors"), and, on the left, a much larger figure (according to the German archaeologists who discovered it, probably Mani himself) — only the head and shoulders of which remain — wearing a pale violet-gray miter with red-orange designs (PL. 283).

Of the other fresco fragments found in Ruin K, one shows portions of the heads of three divinities (PL. 285); another is a detail of a garment, of some high ecclesiastical dignitary, apparently; while a third and particularly interesting fragment represents four warriors, armed with bows and long spears and dressed in long, multicolored robes, one of them adorned with green flowers.

Ruin α has also yielded a fragment of a large composition that shows two figures, but only the heads and shoulders have been preserved; the figures closely resemble those in the large fresco of Ruin K, for they are dressed in white, wear white miters, and have Western faces with beards and mustaches.

These murals, the only Manichaean frescoes presently known, exhibit all the characteristics of the Buddhist paintings of the T'ang period in the Turfan region, as well as unmistakable traces of late Sassanian influence. A special technique was used in the frescoes at Bezeklik, but those at Khocho appear to have been executed on a surface similar to that of the earlier Buddhist frescoes of that region.

The influence of Chinese art is reflected in some of the general features — such as the over-all tone of some of the frescoes and the importance accorded the drawing, in which lines add lightness and fluency to the composition. Indeed, many of the frescoes, as well as the paintings on silk banners and the manuscript miniatures, are in a light key, determined partly by the large number of white garments that are often the dominant element in the compositions, and partly by the use of a very pale gray tone for the background. This same tendency seems to prevail in the frescoes at Kumtura, in which Chinese influence predominates (the majority of the paintings adorning the Cave of the Apsaras are in light tones, and those in the Cave of Nirvana also display these same characteristics), whereas it contrasts sharply with that prevailing at Kizil, where bright tones are juxtaposed to the point of constituting almost violent contrasts (I, PLS. 483, 484). Furthermore, the marked affinity with Chinese art that is revealed in the drawing — which is characterized essentially by fluid lines — is even more evident in the long flowing garments with wide sleeves, which are the same as were worn in China during the T'ang period and quite unlike the dress displayed by the figures in the Kizil paintings or in the earliest Kumtura frescoes; the costume depicted in the latter frescoes consists of a tailored jacket with tight sleeves and close-fitting trousers, very similar to the type worn by the Iranians and Sogdians (see COSTUME).

It seems, however, that Chinese art was not the sole influence on the Manichaean frescoes, which may well have some affinity with the painting of Central Asia, for the juxtaposition of bright tones here and there corresponds to the tendency manifest in the frescoes at Kizil, despite a fairly pronounced difference in their reds and blues. The influence of Sassanid Iran is also apparent — in one of the frescoes in Ruin K, for instance, and,

specifically, in the detail of a medallion enclosing the representation of a divinity, of which only the haloed head and a raised hand still remain; this medallion is adorned with large beads — a motif undoubtedly derived from Sassanian art, for it also occurs at both Tumshuk and Kizil.

PAINTINGS ON SILK. The surviving fragments of paintings on silk reveal similar tendencies (PLS. 286, 287). The two votive banners found at Khocho are adorned with a male and a female figure, respectively, both drawn to a large scale and doubtless representing Manichaean elect. Another fragment of silk from the same source is adorned with a text and, below this, with an ornamental band on which only the head and shoulders of two helmeted warriors remain; though somewhat coarse, the drawing is extremely interesting. Here the helmets have a plate extending over the forehead, like a kind of nosepiece, recalling those of certain warriors at Shorchuk and comparable to those worn by some figures at Pyandzhikent.

The fragment discovered in Ruin α is equally noteworthy, for both its size and its subject matter. The printing is in a yellow-bistre frame — bounded along its remaining, vertical edge with two thick black lines — and is bordered along the top with a band of geometrical designs on a red-orange background, above which, on a bistre and light-yellow background, there must have been a scene that is now no longer discernible. The painting represented, against a blue background, two rows of five seated Manichaean elect (only four of each row remain), their hands hidden in the wide, flowing sleeves of their white robes. These figures wear a sort of cap made of white material which falls in folds behind the head and over the ears; below this group is a fragment of a halo which must have encircled the head of a divinity or of the principal figure. As in the frescoes representing a similar subject, the drapery is merely indicated by a few brownish lines; the dress as a whole is of a Chinese type, although the figures have decidedly pink complexions — a fact which seems to indicate that they are not Chinese.

The fragments of embroidered silk depict typically Chinese dragons, with elongated and twisted bodies, as well as a cock and lotus flowers. One of the most interesting pieces in this category is a fragment that shows a magnificently attired divinity, accompanied by a few of the elect wearing the usual white robes; each figure stands on a stylized, rather dark, blue and brownish-yellow lotus, clearly derived from Buddhist art.

PAINTINGS ON PAPER AND MINIATURES. The paintings on paper and miniatures adorning manuscripts, of which quite a number have survived, are of extremely varied inspiration. In some — as in the frescoes and in the majority of the paintings on silk — Chinese influence predominates; some proceed from purely Central Asian sources, while others clearly derive from prototypes to be sought in western Asia, if any Sassanian or Manichaean miniatures had survived there. The latter, in fact, most likely contributed toward the evolution of the Arabo-Persian miniatures of the Mongol period, and perhaps even of the pre-Mongol era, which ultimately led to the development of the Indo-Persian miniatures of Moghul India (see MOGHUL SCHOOL).

Among the paintings on paper which reveal Chinese influences is a scroll, found at Khocho, of which only the illuminated title remains (PL. 281); it is possible to discern a few letters of the text, but the title itself, which is set in a vertical rectangle, does not show up in reproductions because the ink is so pale. The rectangular space is a sort of banner (vexillum), suspended from a wooden rod that is adorned at either end with a motif of rising flames and is surmounted by a miter made of fur and/or feathers; two scarves, each tied with a knot at either end of the rod, fall symmetrically on either side of the banner and are held by two divinities. These figures wear Chinese robes and tall headdresses with veils suspended from them; their coiffure — of a rather distinctive type which reappears in some of the miniatures — consists of a few curls on the forehead, the rest of the hair hanging down over the shoulders. They stand on a pedestal in the form of a lotus, and they wear over their robes a Chinese type of armor reminiscent of the kind seen at Tun-huang.

A fragment of a manuscript found in Ruin α shows a few kneeling figures, also dressed in Chinese fashion, who, judging by their positions, must originally have formed part of a group surrounding a central figure, since lost. The long white object they hold in their hands could be a *kuei* (Chinese emblem of dignity), according to Von Le Coq. The only figure whose head is intact wears a sort of cap with a veil hanging from the back of it; Von Le Coq likened this cap to the headdress in the fragment he called the "Gandhara miniature," the latter headdress being, in his opinion, of Sassanian derivation.

Another miniature, from Murtuk, on a page shaped like a *pothī* (Indian manuscript of oblong form), shows a priest with typically Central Asiatic features, dressed in white robes and kneeling on a rug under a tree covered with huge flowers in many colors, his tiara hanging on a branch behind him; perhaps this is a representation of Mani in prayer.

Two miniatures, which doubtless manifest a purely local influence, so closely resemble Buddhist paintings that they may well have been directly inspired by Buddhism. One of these probably depicts a divinity, seated in European fashion on a red throne, his head crowned with a sort of diadem and encircled by a reddish halo. The background, as in most Manichaean miniatures, is blue, and the throne is placed under a red canopy (only one side of which remains), draped with a voluminous red curtain held back by a cord. The figure, the folds of whose garments recall those of the bodhisattvas, raises his right (and sole remaining) hand in the gesture of teaching (see BUDDHISM). The other miniature is probably of a bodhisattva; it shows a haloed figure enclosed in a vast mandorla.

A fragment from Khocho depicts a half-length female figure wearing a tight-fitting and very décolleté tunic-corselet, which has all the characteristics of the garments found in the frescoes at Kizil and Kumtura and on a statuette from Tumshuk. Another fragment from Khocho shows the remains of a vertical band outlined with a motif — derived from Sassanian tradition — of large white beads, as well as the head of some divinity.

The rest of the surviving miniatures constitute a fairly homogeneous group, whose origins should most likely be sought in Iran or in the eastern Mediterranean area. It seems possible to distinguish several different types among the miniatures in this group, which also includes some decorative motifs bordering the manuscripts, a few of these borders having survived with the miniatures, while others are the only remnants of the pages they adorned.

The fragment found at Khocho, called the "Gandhara miniature" by Von Le Coq, shows five ladies of high rank, each wearing a crown of a type similar to that found in Gandharan art (see GANDHARA), according to Von Le Coq; moreover, their dress is not Uigurian, but Iranian, and the name of each figure is written in Sogdian script near her head. In its treatment of the face and hair, this fragment bears a definite relation to two other small fragments from Khocho, also depicting female figures; two additional small fragments of paintings, one of a male and the other of a female figure, are also treated in the same manner. The female figure, in three-quarter view, is wearing a white cap with a curved brim, topped with a golden disk mounted on a low base. The bearded male figure, who has long hair hanging down his back, is of the same type; he is dressed in red and also wears a strange white cap shaped like an inverted flower cup.

A fragment illuminated on both sides, found in Ruin α at Khocho, may be classed in the same category (PL. 284). On one side, in the margin of a text in red Manichaean script, two figures are shown kneeling on a lotus with red petals and a gold center; both have halos and must therefore be divinities, though their features denote a demonic nature. On the other side, a centered miniature shows two beardless figures, nude except for white loincloths, advancing toward a third figure on the very edge of the fragment (on which may also be seen a part of the shoulder of still another figure dressed in green), his left hand raised above his shoulder with the index finger pointing in the air, as if beckoning to the two prisoners to come forward. The latter are separated, above, by a green sheaf and, below, by two footprints (?).

441

Another type of miniature is represented by two fragments, one of them of a miniature — framed by the text and by red ornamental motifs containing nude, dancing "putti" — showing two figures in Chinese dress kneeling on a rug in prayer before two tall, white, semiobliterated forms wearing white miters; these are seated on another rug. The other fragment is of a miniature depicting six figures — three male and three female — also kneeling on a rug, who are wearing the same brightly colored garments as the many figures in the frescoes of the Uigur period at Turfan; although it is difficult to determine the various influences underlying this composition, the garments are of a Chinese type, especially those of the female figures, whose tall headdresses are typical of the T'ang period. Above this group is a stylized tree with enormous red, lotus-shaped flowers; two of these flowers support bearded figures in white — seated crosslegged — one of whom wears a white miter (the top of the other's head is missing), while somewhat higher, on a flower in bloom, there seems to be a gilded throne on which another figure must have been seated with legs crossed.

Two large fragments belong in this same category. One of these (PL. 287), found in Ruin K at Khocho, is illuminated on both sides, one side depicting two rows of bearded elect in white tiaras, their black hair pushed back behind their ears; each kneels behind a draped writing table, on which a sheet of white paper is spread, and some hold pens and seem to be about to write. The other side consists of a text bordered by flowering boughs and by a miniature — likewise bordered by a branch in bloom — of a row of small, kneeling figures playing on various musical instruments.

The second large fragment, found in Ruin α at Khocho, is far more complex (PL. 282). On one side of it is depicted a scene in a hall with richly decorated walls and floor — probably an assembly convened on the occasion of some feast. The other side has a curious appearance: a central miniature is framed by the text, which is in turn bordered by severely damaged bands of ornamentation. The various figures represented include a Gaṇeśa with a green halo and a divinity with a boar's head haloed in red.

One fragment, in extremely poor condition, is adorned with representations of divinities, on one side with a large figure that has a rather intricate gold halo, and on the other with another large figure flanked, on the right and left, by two smaller figures apparently standing either under an arch or in a niche. In both compositions it is possible to descry a few winged figures whose origins may be traced to the West, for they recall the winged Victories adorning both the monument at Ṭāq-i-Bustan in Iran and the Cave of the Pretas at Kizil (I, PL. 474).

A few other fragments, with illuminations outlined in black on a slightly tinted background, seem not to fit into any group. One shows a bearded figure with huge eyes, wearing an elaborate headdress, seated with legs crossed; another shows a few figures in tall caps, but the figures are damaged and their faces obliterated. The highly stylized decorative motifs, though reminiscent of certain isolated motifs in other fragments, seem to be peculiar to this group.

Floral decoration of the text is as characteristic of Manichaean art as the prominence accorded the inscriptions, usually brightly colored or gilded, that constitute the manuscript titles. Composed of branches of huge fruit, of floral bands, and of flowers of all kinds, the decoration serves as both a frame and a background for the letters, without ever blending into or forming part of them. This mode of decoration seems to be the same as that used in late Coptic manuscripts; in the Manichaean manuscripts of Turfan, however, the decoration projects beyond the heading to border the whole margin of the manuscripts.

There are no written documents on the manner in which these miniatures were executed. Here is an art which survived only among the Uigurs of Turfan, and that under extraordinary circumstances; moreover, the neighboring regions have as yet furnished no similar works which might link this art to artistic manifestations of the same genre in Iran or in the eastern Mediterranean region.

DATING AND CHARACTERISTICS. No criterion for dating these miniatures is really valid. It is possible that some manuscripts were illuminated during a period prior to the settlement of the Uigurs at Khocho; these were executed either by the Uigur Manichaean community established at Khocho before the Uigurs seized control of the region in 840, or they were done at an earlier date by the Manichaean community established at Kara Balghasun in 763 — the year in which the khan of the Uigurs brought the first Manichaean priests from Lo-yang. The problem of dating is indeed insoluble, for Manichaeanism continued to flourish among the Uigurs after the restoration of Buddhism, a fact attested by Islamic writers and in the account of the Chinese envoy, Wang Yen-tê, who visited the Uigurian kingdom between 981 and 984. The period in which these miniatures could have been executed thus extends over at least three centuries, if not longer. The problem of dating is further complicated by the variety of influences manifest in this art and by the fact that it is difficult to distinguish the different elements constituting it, to determine its origins, or even roughly to trace its development.
